32M x 8 Bit NAND Flash Memory

PRODUCT LIST

Part Number	Vcc Range	Organization	PKG Type
K9F5608R0D-J	1.65 ~ 1.95V	X8	FBGA
K9F5608D0D-P	2.4 ~ 2.9V		TSOP1
K9F5608D0D-J			FBGA
K9F5608U0D-P	2.7 ~ 3.6V		TSOP1
K9F5608U0D-J			FBGA
K9F5608U0D-F			WSOP1

FEATURES

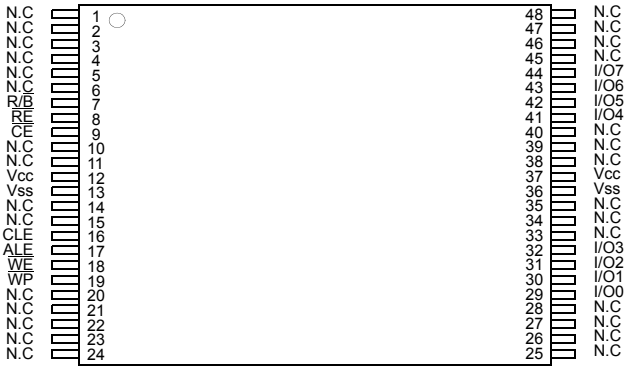
- Voltage Supply
  - 1.8V device(K9F5608R0D) : 1.65~1.95V
  - 2.65V device(K9F5608D0D) : 2.4~2.9V
  - 3.3V device(K9F5608U0D) : 2.7 ~ 3.6 V
- Organization
  - Memory Cell Array
    -(32M + 1024K)bit x 8 bit
  - Data Register
    - (512 + 16)bit x 8bit
- Automatic Program and Erase
  - Page Program
    -(512 + 16)Byte
  - Block Erase :
    - (16K + 512)Byte
- Page Read Operation
  - Page Size
    - (512 + 16)Byte
  - Random Access : 15μs(Max.)
  - Serial Page Access : 50ns(Min.)
- Fast Write Cycle Time
  - Program time : 200μs(Typ.)
  - Block Erase Time : 2ms(Typ.)
- Command/Address/Data Multiplexed I/O Port
- Hardware Data Protection
  - Program/Erase Lockout During Power Transitions
- Reliable CMOS Floating-Gate Technology
  - Endurance : 100K Program/Erase Cycles
  - Data Retention : 10 Years
- Command Register Operation
- Intelligent Copy-Back
- Unique ID for Copyright Protection
- Package
  - K9F5608D(U)0D-PCB0/PIB0
    48 - Pin TSOP I (12 x 20 / 0.5 mm pitch)- Pb-free Package
  - K9F5608X0D-JCB0/JIB0
    63- Ball FBGA (9 x 11 /0.8mm pitch , Width 1.0 mm)
    - Pb-free Package
  - K9F5608U0D-FCB0/FIB0
    48 - Pin WSOP I (12X17X0.7mm)- Pb-free Package
    * K9F5608U0D-F(WSOPI) is the same device as K9F5608U0D-P(TSOP1) except package type.

GENERAL DESCRIPTION

Offered in 32Mx8bit , the K9F5608X0D is 256M bit with spare 8M bit capacity. The device is offered in 1.8V, 2.65V, 3.3V Vcc. Its NAND cell provides the most cost-effective solutIon for the solid state mass storage market. A program operation can be performed in typical 200μs on a 528-byte page and an erase operation can be performed in typical 2ms on a 16K-byte block. Data in the page can be read out at 50ns cycle time per byte. The I/O pins serve as the ports for address and data input/output as well as command input. The on-chip write control automates all program and erase functions including pulse repetition, where required, and internal verification and margining of data. Even the write-intensive systems can take advantage of the K9F5608X0D's extended reliability of 100K program/erase cycles by providing ECC(Error Correcting Code) with real time mapping-out algorithm.
The K9F5608X0D is an optimum solution for large nonvolatile storage applications such as solid state file storage and other portable applications requiring non-volatility.

PIN CONFIGURATION (TSOP1)

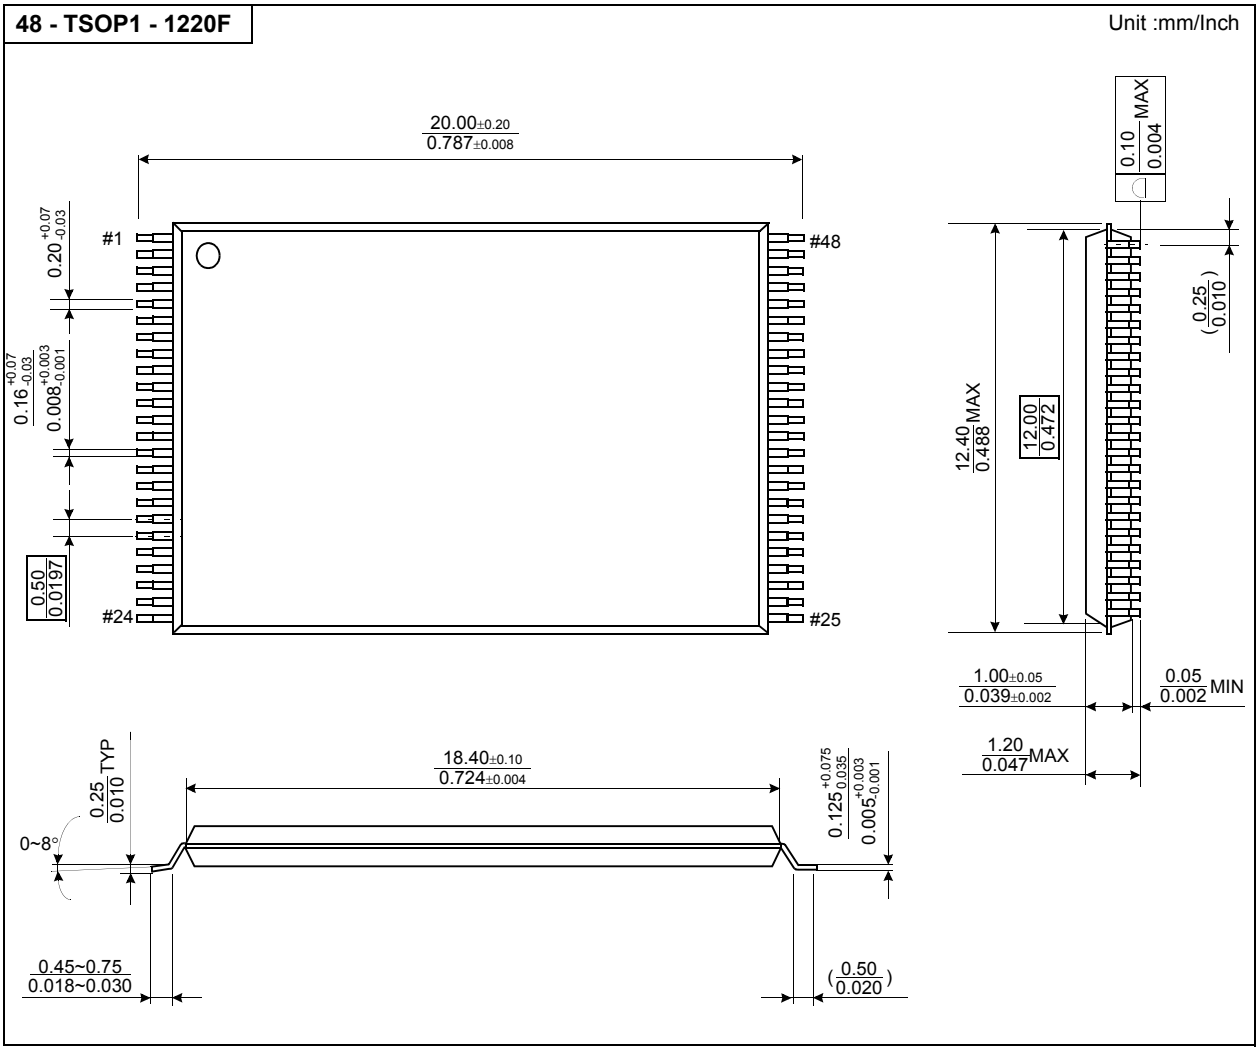
K9F5608D(U)0D-PCB0/PIB0



PACKAGE DIMENSIONS

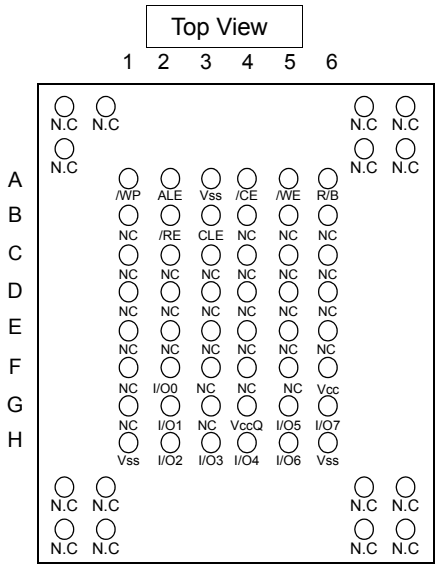
48-PIN LEAD/LEAD FREE PLASTIC THIN SMALL OUT-LINE PACKAGE TYPE(I)

48 - TSOP1 - 1220F Unit :mm/Inch



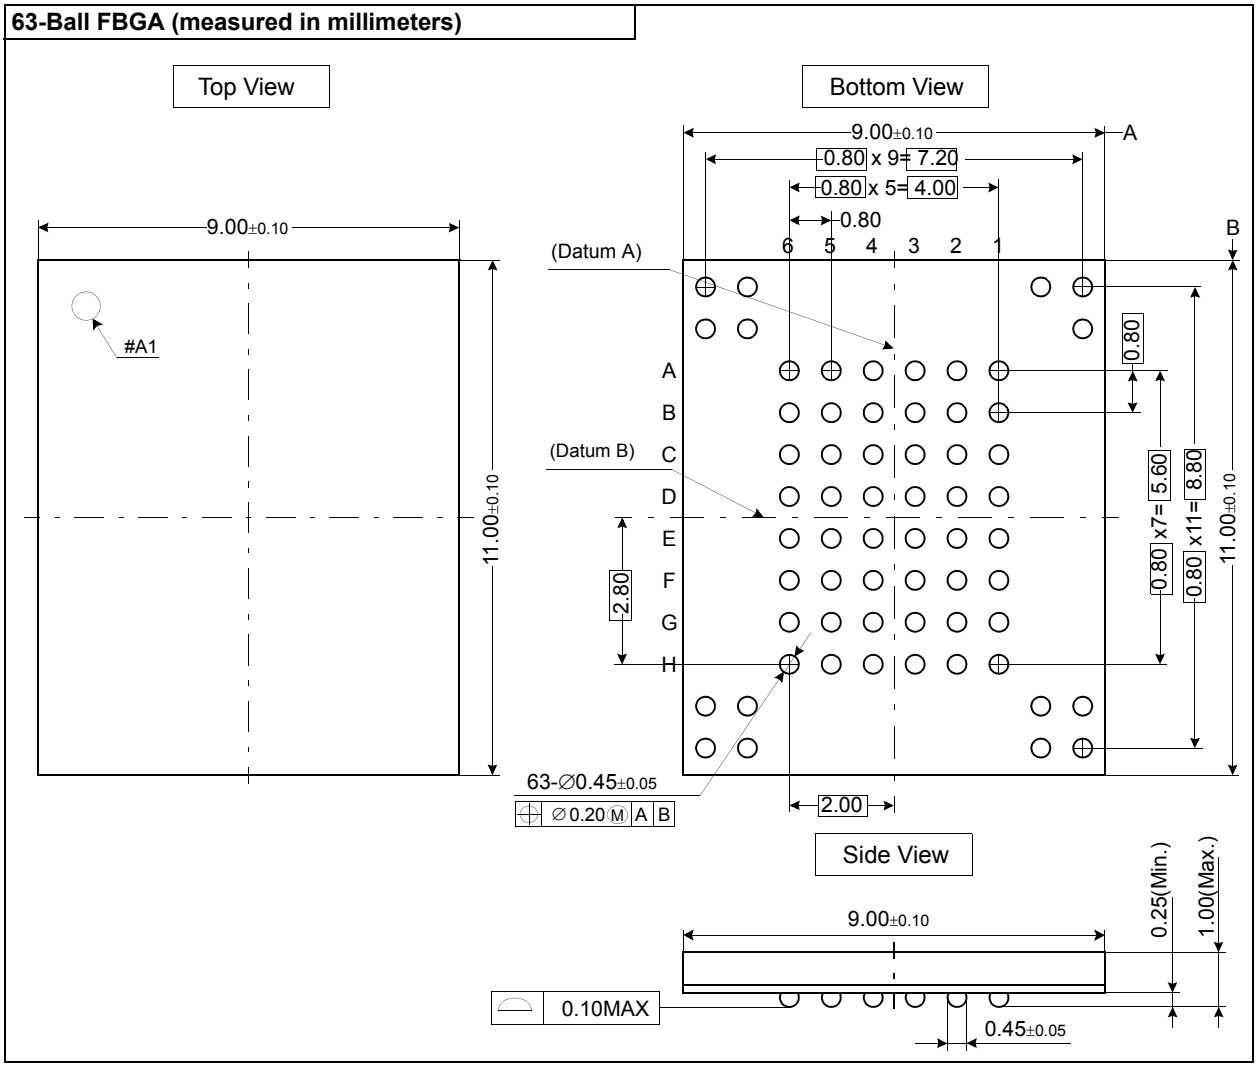
PIN CONFIGURATION (FBGA)

K9F5608X0D-JCB0/JIB0



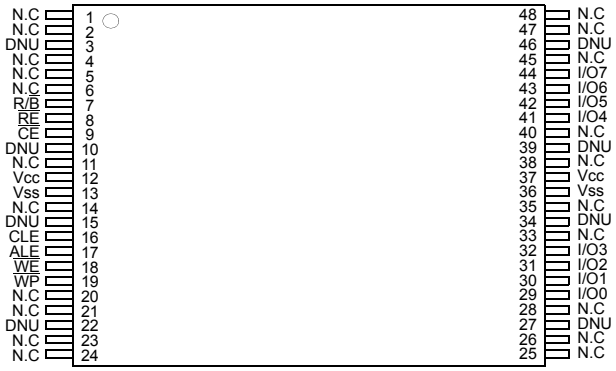
PACKAGE DIMENSIONS

63-Ball FBGA (measured in millimeters)



PIN CONFIGURATION (WSOP1)

K9F5608U0D-FCB0/FIB0

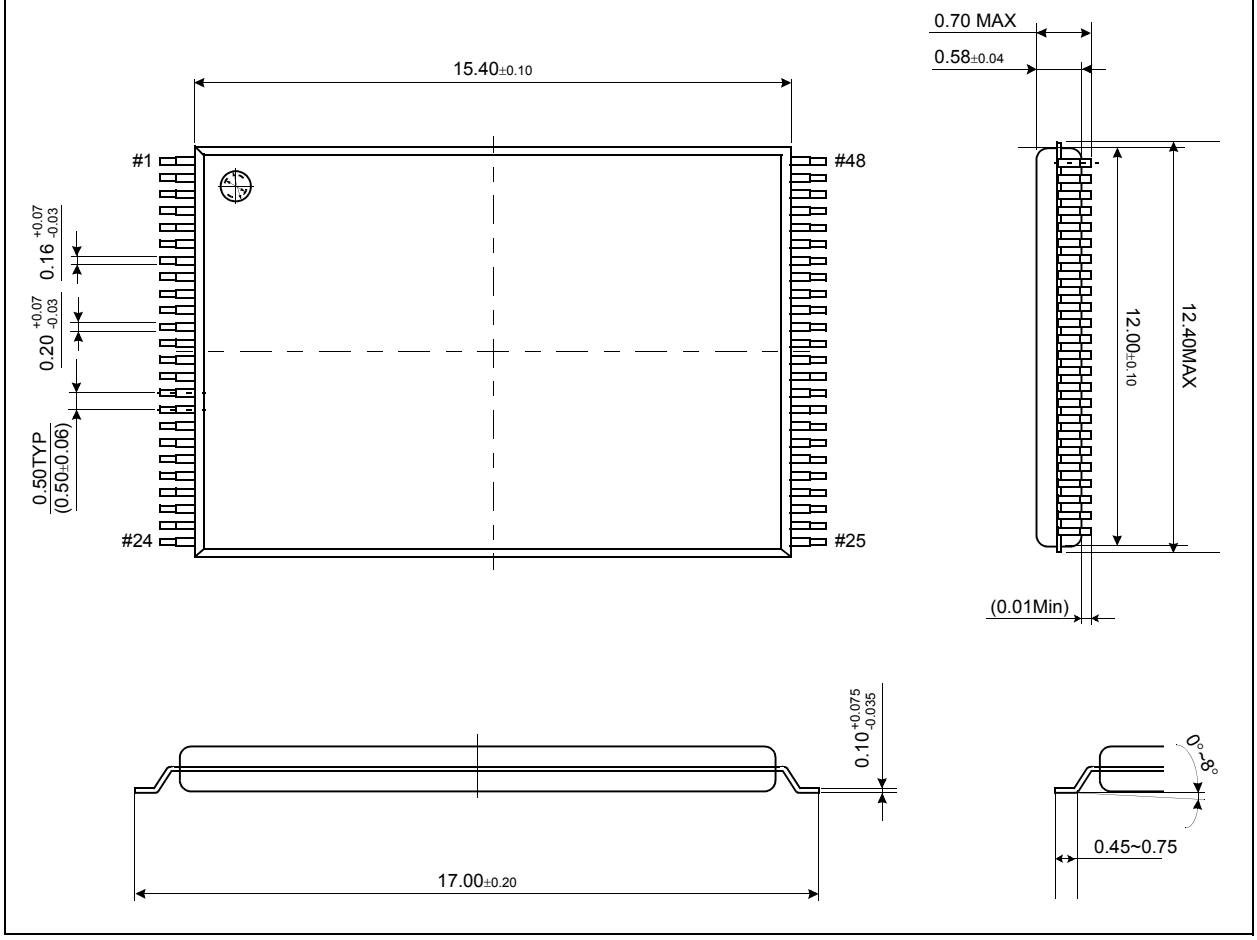


PACKAGE DIMENSIONS

48-PIN LEAD PLASTIC VERY VERY THIN SMALL OUT-LINE PACKAGE TYPE (I)

48 - WSOP1 - 1217F

Unit :mm



PIN DESCRIPTION

Pin NAME	Pin Function
$I/O_0 \sim I/O_7$	**DATA INPUTS/OUTPUTS** The I/O pins are used to input command, address and data, and to output data during read operations. The I/O pins float to high-z when the chip is deselected or when the outputs are disabled.
CLE	**COMMAND LATCH ENABLE** The CLE input controls the activating path for commands sent to the command register. When active high, commands are latched into the command register through the I/O ports on the rising edge of the $\overline{WE}$ signal.
ALE	**ADDRESS LATCH ENABLE** The ALE input controls the activating path for address to the internal address registers. Addresses are latched on the rising edge of $\overline{WE}$ with ALE high.
$\overline{CE}$	**CHIP ENABLE** The $\overline{CE}$ input is the device selection control. When the device is in the Busy state, $\overline{CE}$ high is ignored, and the device does not return to standby mode in program or erase operation. Regarding $\overline{CE}$ control during read operation, refer to 'Page read' section of Device operation.
$\overline{RE}$	**READ ENABLE** The $\overline{RE}$ input is the serial data-out control, and when active drives the data onto the I/O bus. Data is valid tREA after the falling edge of $\overline{RE}$ which also increments the internal column address counter by one.
$\overline{WE}$	**WRITE ENABLE** The $\overline{WE}$ input controls writes to the I/O port. Commands, address and data are latched on the rising edge of the $\overline{WE}$ pulse.
$\overline{WP}$	**WRITE PROTECT** The $\overline{WP}$ pin provides inadvertent write/erase protection during power tra nsitions. The internal high voltage generator is reset when the $\overline{WP}$ pin is active low.
R/$\overline{B}$	**READY/BUSY OUTPUT** The R/$\overline{B}$ output indicates the status of the device operation. When low, it indicates that a program, erase or random read operation is in process and returns to high state upon completion. It is an open drain output and does not float to high-z condition when the chip is deselected or when outputs are disabled.
V_{CCQ}	**OUTPUT BUFFER POWER** V_{CCQ} is the power supply for Output Buffer. V_{CCQ} is internally connected to Vcc, thus should be biased to Vcc.
Vcc	**POWER** V_{CC} is the power supply for device.
Vss	**GROUND**
N.C	**NO CONNECTION** Lead is not internally connected.
DNU	**DO NOT USE** Leave it disconnected

NOTE : Connect all V_{CC} and V_{SS} pins of each device to common power supply outputs.
Do not leave V_{CC} or V_{SS} disconnected.

Figure 1-1. K9F5608X0D FUNCTIONAL BLOCK DIAGRAM

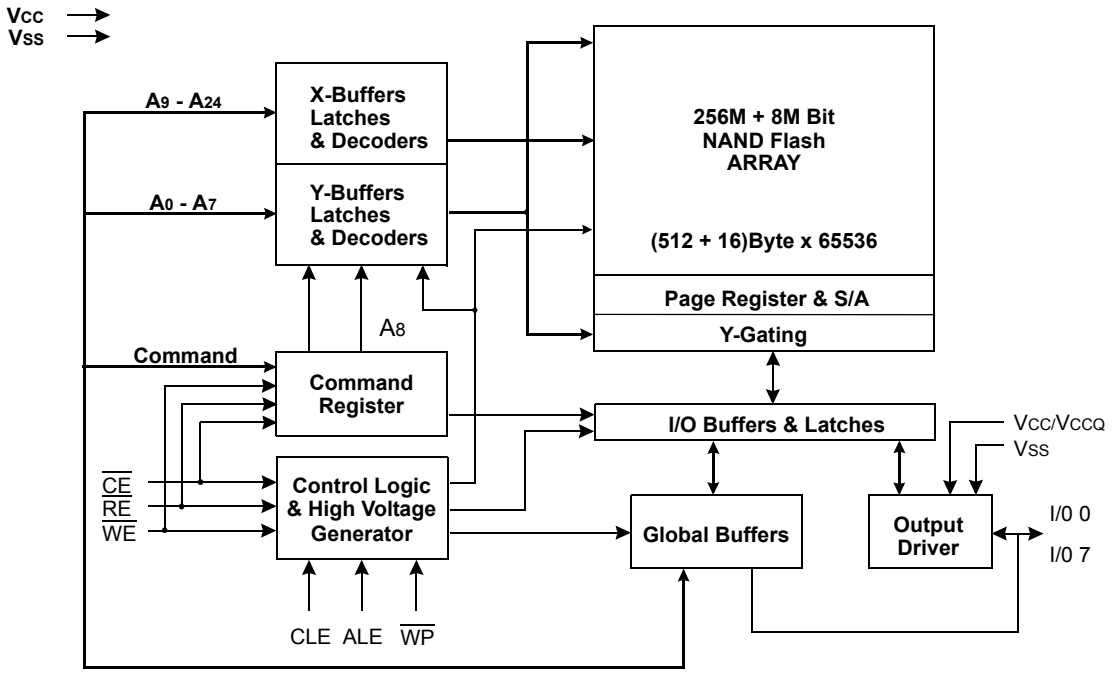


Figure 2-1. K9F5608X0D ARRAY ORGANIZATION

	I/O 0	I/O 1	I/O 2	I/O 3	I/O 4	I/O 5	I/O 6	I/O 7	
1st Cycle	A0	A1	A2	A3	A4	A5	A6	A7	**Column Address**
2nd Cycle	A9	A10	A11	A12	A13	A14	A15	A16	**Row Address (Page Address)**
3rd Cycle	A17	A18	A19	A20	A21	A22	A23	A24	

NOTE : Column Address : Starting Address of the Register.

00h Command(Read) : Defines the starting address of the 1st half of the register.

01h Command(Read) : Defines the starting address of the 2nd half of the register.

* A8 is set to "Low" or "High" by the 00h or 01h Command.

* The device ignores any additional input of address cycles than required.

PRODUCT INTRODUCTION

The K9F5608X0D is a 264Mbit(276,824,064 bit) memory organized as 65,536 rows(pages) by 528 columns. Spare eight columns are located from column address of 512~527. A 528-byte data register is connected to memory cell arrays accommodating data transfer between the I/O buffers and memory during page read and page program operations.The memory array is made up of 16 cells that are serially connected to form a NAND structure. Each of the 16 cells resides in a different page. A block consists of two NAND structured strings. A NAND structure consists of 16 cells. Total 135168 NAND cells reside in a block. The array organization is shown in Figure 2-1. The program and read operations are executed on a page basis, while the erase operation is executed on a block basis. The memory array consists of 2048 separately erasable 16K-Byte blocks. It indicates that the bit by bit erase operation is prohibited on the K9F5608X0D.

The K9F5608X0D has addresses multiplexed into 8 I/Os. This scheme dramatically reduces pin counts while providing high performance and allows systems upgrades to future densities by maintaining consistency in system board design. Command, address and data are all written through I/O's by bringing $\overline{WE}$ to low while $\overline{CE}$ is low. Data is latched on the rising edge of $\overline{WE}$. Command Latch Enable(CLE) and Address Latch Enable(ALE) are used to multiplex command and address respectively, via the I/O pins. Some commands require one bus cycle. For example, Reset command, Read command, Status Read command, etc require just one cycle bus. Some other commands like Page Program and Copy-back Program and Block Erase, require two cycles: one cycle for setup and the other cycle for execution. The 32M-byte physical space requires 24 addresses, thereby requiring three cycles for word-level addressing: column address, low row address and high row address, in that order. Page Read and Page Program need the same three address cycles following the required command input. In Block Erase operation, however, only the two row address cycles are used. Device operations are selected by writing specific commands into the command register. Table 1 defines the specific commands of the K9F5608X0D.

The device includes one block sized OTP(One Time Programmable), which can be used to increase system security or to provide identification capabilities. Detailed information can be obtained by contact with Samsung.

Table 1. COMMAND SETS

Function	1st. Cycle	2nd. Cycle	Acceptable Command during Busy
Read 1	00h/01h	-	
Read 2	50h	-	
Read ID	90h	-	
Reset	FFh	-	O
Page Program	80h	10h	
Copy-Back Program	00h	8Ah	
Block Erase	60h	D0h	
Read Status	70h	-	O

Caution : Any undefined command inputs are prohibited except for above command set of Table 1.

ABSOLUTE MAXIMUM RATINGS

Parameter		Symbol	Rating	Unit
Voltage on any pin relative to V_{SS}		$V_{IN/OUT}$	-0.6 to + 4.6	V
		V_{CC}	-0.6 to + 4.6	
		V_{CCQ}	-0.6 to + 4.6	
Temperature Under Bias	K9F5608X0D-XCB0	T_{BIAS}	-10 to +125	°C
	K9F5608X0D-XIB0		-40 to +125	
Storage Temperature	K9F5608X0D-XCB0	T_{STG}	-65 to +150	°C
	K9F5608X0D-XIB0			
Short Circuit Current		Ios	5	mA

NOTE :
1. Minimum DC voltage is -0.6V on input/output pins. During transitions, this level may undershoot to -2.0V for periods <30ns.
   Maximum DC voltage on input/output pins is V_{CC}+0.3V which, during transitions, may overshoot to V_{CC}+2.0V for periods <20ns.
2. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED OPERATING CONDITIONS

(Voltage reference to GND, K9F5608X0D-XCB0 :T_A=0 to 70°C, K9F5608X0D-XIB0:T_A=-40 to 85°C)

Parameter	Symbol	K9F5608R0D(1.8V)			K9F5608D0D(2.65V)			K9F5608U0D(3.3V)			Unit
		Min	Typ.	Max	Min	Typ.	Max	Min	Typ.	Max	
Supply Voltage	V_{CC}	1.65	1.8	1.95	2.4	2.65	2.9	2.7	3.3	3.6	V
Supply Voltage	V_{CCQ}	1.65	1.8	1.95	2.4	2.65	2.9	2.7	3.3	3.6	V
Supply Voltage	V_{SS}	0	0	0	0	0	0	0	0	0	V

DC AND OPERATING CHARACTERISTICS(Recommended operating conditions otherwise noted.)

Parameter		Symbol	Test Conditions	K9F5608X0D									Unit
				1.8V			2.65V			3.3V			
				Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	
Operating Current	Sequential Read	$I_{CC}1$	tRC=50ns, $\overline{CE}$=V_{IL}, I_{OUT}=0mA	-	8	20	-	10	20	-	10	20	mA

Output High Voltage Level		V_{OH}	K9F5608R0D :I_{OH}=-100µA K9F5608D0D :I_{OH}=-100µA K9F5608U0D :I_{OH}=-400µA	V_{CCQ} -0.1	-	-	V_{CCQ} -0.4	-	-	2.4	-	-	
Output Low Voltage Level		V_{OL}	K9F5608R0D :I_{OL}=100uA K9F5608D0D :I_{OL}=100µA K9F5608U0D :I_{OL}=2.1mA	-	-	0.1	-	-	0.4	-	-	0.4	
Output Low Current(R/$\overline{B}$)		I_{OL}(R/$\overline{B}$)	K9F5608R0D :V_{OL}=0.1V K9F5608D0D :V_{OL}=0.1V K9F5608U0D :V_{OL}=0.4V	3	4	-	3	4	-	8	10	-	mA

NOTE : V_{IL} can undershoot to -0.4V and V_{IH} can overshoot to V_{CC} +0.4V for durations of 20 ns or less.

VALID BLOCK

Parameter	Symbol	Min	Typ.	Max	Unit
Valid Block Number	N_{VB}	2013	-	2048	Blocks

NOTE :
1. The device may include invalid blocks when first shipped. Additional invalid blocks may develop while being used. The number of valid blocks is presented with both cases of invalid blocks considered. Invalid blocks are defined as blocks that contain one or more bad bits. Do not erase or program factory-marked bad blocks. Refer to the attached technical notes for a appropriate management of invalid blocks.
2. The 1st block, which is placed on 00h block address, is guaranteed to be a valid block, does not require Error Correction up to 1K Program/Erase cycles.
3. Minimum 1004 valid blocks are guaranteed for each contiguous 128Mb memory space.

AC TEST CONDITION

(K9F5608X0D-XCB0 :TA=0 to 70°C, K9F5608X0D-XIB0:TA=-40 to 85°C
K9F5608R0D : Vcc=1.65V~1.95V , K9F5608D0D : Vcc=2.4V~2.9V , K9F5608U0D : Vcc=2.7V~3.6V unless otherwise noted)

Parameter	K9F5608R0D	K9F5608D0D	K9F5608U0D
Input Pulse Levels	0V to V_{CCQ}	0V to V_{CCQ}	0.4V to 2.4V
Input Rise and Fall Times	5ns	5ns	5ns
Input and Output Timing Levels	V_{CCQ}/2	V_{CCQ}/2	1.5V
K9F5608R0D:Output Load (V_{CCQ}:1.8V +/-10%) K9F5608D0D:Output Load (V_{CCQ}:2.65V +/-10%) K9F5608U0D:Output Load (V_{CCQ}:3.0V +/-10%)	1 TTL GATE and CL=30pF	1 TTL GATE and CL=30pF	1 TTL GATE and CL=50pF
K9F5608U0D:Output Load (V_{CCQ}:3.3V +/-10%)	-	-	1 TTL GATE and CL=100pF

CAPACITANCE (T_A=25°C, V_{CC}=1.8V/2.65V/3.3V, f=1.0MHz)

Item	Symbol	Test Condition	Min	Max	Unit
Input/Output Capacitance	$C_{I/O}$	V_{IL}=0V	-	10	pF
Input Capacitance	C_{IN}	V_{IN}=0V	-	10	pF

NOTE : Capacitance is periodically sampled and not 100% tested.

MODE SELECTION

CLE	ALE	$\overline{CE}$	$\overline{WE}$	$\overline{RE}$	$\overline{WP}$	Mode	
H	L	L	↑	H	X	Read Mode	Command Input
L	H	L	↑	H	X		Address Input(3clock)
H	L	L	↑	H	H	Write Mode	Command Input
L	H	L	↑	H	H		Address Input(3clock)
L	L	L	↑	H	H	Data Input	
L	L	L	H	↓	X	Data Output	
L	L	L	H	H	X	During Read(Busy) On K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P	
X	X	X	X	H	X	During Read(Busy) on the devices except On K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P	
X	X	X	X	X	H	During Program(Busy)	
X	X	X	X	X	H	During Erase(Busy)	
X	X(1)	X	X	X	L	Write Protect	
X	X	H	X	X	0V/V_{CC}(2)	Stand-by	

NOTE : 1. X can be V_{IL} or V_{IH}.
2. $\overline{WP}$ should be biased to CMOS high or CMOS low for standby.

PROGRAM/ERASE CHARACTERISTICS

Parameter		Symbol	Min	Typ	Max	Unit
Program Time		t_{PROG}	-	200	500	μs
Number of Partial Program Cycles in the Same Page	Main Array	Nop	-	-	2	cycles
	Spare Array		-	-	3	cycles
Block Erase Time		t_{BERS}	-	2	3	ms

AC TIMING CHARACTERISTICS FOR COMMAND / ADDRESS / DATA INPUT

Parameter	Symbol	Min	Max	Unit
CLE setup Time	t_{CLS}	0	-	ns
CLE Hold Time	t_{CLH}	10	-	ns
$\overline{CE}$ setup Time	t_{CS}	0	-	ns
$\overline{CE}$ Hold Time	t_{CH}	10	-	ns
$\overline{WE}$ Pulse Width	t_{WP}	25(1)	-	ns
ALE setup Time	t_{ALS}	0	-	ns
ALE Hold Time	t_{ALH}	10	-	ns
Data setup Time	t_{DS}	20	-	ns
Data Hold Time	t_{DH}	10	-	ns
Write Cycle Time	t_{WC}	50	-	ns
$\overline{WE}$ High Hold Time	t_{WH}	15	-	ns
Address to Data Loading Time	t_{ADL}	100	-	ns

NOTE: 1. If tCS is set less than 10ns, tWP must be minimum 35ns, otherwise, tWP may be minimum 25ns.

AC CHARACTERISTICS FOR OPERATION

Parameter	Symbol	Min	Max	Unit
Data Transfer from Cell to Register	t_R	-	15	μs
ALE to $\overline{RE}$ Delay	t_{AR}	10	-	ns
CLE to $\overline{RE}$ Delay	t_{CLR}	10	-	ns
Ready to $\overline{RE}$ Low	t_{RR}	20	-	ns
RE Pulse Width	t_{RP}	25	-	ns
WE High to Busy	t_{WB}	-	100	ns
Read Cycle Time	t_{RC}	50	-	ns
$\overline{RE}$ Access Time	t_{REA}	-	30/35(1)	ns
$\overline{CE}$ Access Time	t_{CEA}	-	45	ns
$\overline{RE}$ High to Output Hi-Z	t_{RHZ}	-	30	ns
$\overline{CE}$ High to Output Hi-Z	t_{CHZ}	-	20	ns
$\overline{RE}$ or $\overline{CE}$ High to Output hold	t_{OH}	15	-	ns
$\overline{RE}$ High Hold Time	t_{REH}	15	-	ns
Output Hi-Z to $\overline{RE}$ Low	t_{IR}	0	-	ns
$\overline{WE}$ High to $\overline{RE}$ Low	t_{WHR}	60	-	ns
Device Resetting Time(Read/Program/Erase)	t_{RST}	-	5/10/500(2)	μs

		Symbol	Min	Max	Uni
K9F5608U0D-P,F or K9F5608D0D--P only	Last RE High to Busy(at sequential read)	t_{RB}	-	100	ns
	$\overline{CE}$ High to Ready(in case of interception by $\overline{CE}$ at	t_{CRY}	-	50 +tr(R/$\overline{B}$)(3)	ns
	$\overline{CE}$ High Hold Time(at the last serial read)(4)	t_{CEH}	100	-	ns

NOTE: 1. K9F5608R0D tREA = 35ns.
2. If reset command(FFh) is written at Ready state, the device goes into Busy for maximum 5us.
3. The time to Ready depends on the value of the pull-up resistor tied R/$\overline{B}$ pin.
4. To break the sequential read cycle, $\overline{CE}$ must be held high for longer time than tCEH.

NAND Flash Technical Notes

Initial Invalid Block(s)

Initial invalid blocks are defined as blocks that contain one or more initial invalid bits whose reliability is not guaranteed by Samsung. The information regarding the initial invalid block(s) is so called as the initial invalid block information. Devices with initial invalid block(s) have the same quality level as devices with all valid blocks and have the same AC and DC characteristics. An initial invalid block(s) does not affect the performance of valid block(s) because it is isolated from the bit line and the common source line by a select transistor. The system design must be able to mask out the invalid block(s) via address mapping. The 1st block, which is placed on 00h block address, is guaranteed to be a valid block, does not require Error Correction up to 1K Program/Erase cycles.

Identifying Initial Invalid Block(s)

All device locations are erased(FFh) except locations where the initial invalid block(s) information is written prior to shipping. The initial invalid block(s) status is defined by the 6th byte in the spare area. Samsung makes sure that either the 1st or 2nd page of every initial invalid block has non-FFh data at the column address of 517. Since the initial invalid block information is also erasable in most cases, it is impossible to recover the information once it has been erased. Therefore, the system must be able to recognize the initial invalid block(s) based on the initial invalid block information and create the initial invalid block table via the following suggested flow chart(Figure 3). Any intentional erasure of the initial invalid block information is prohibited.

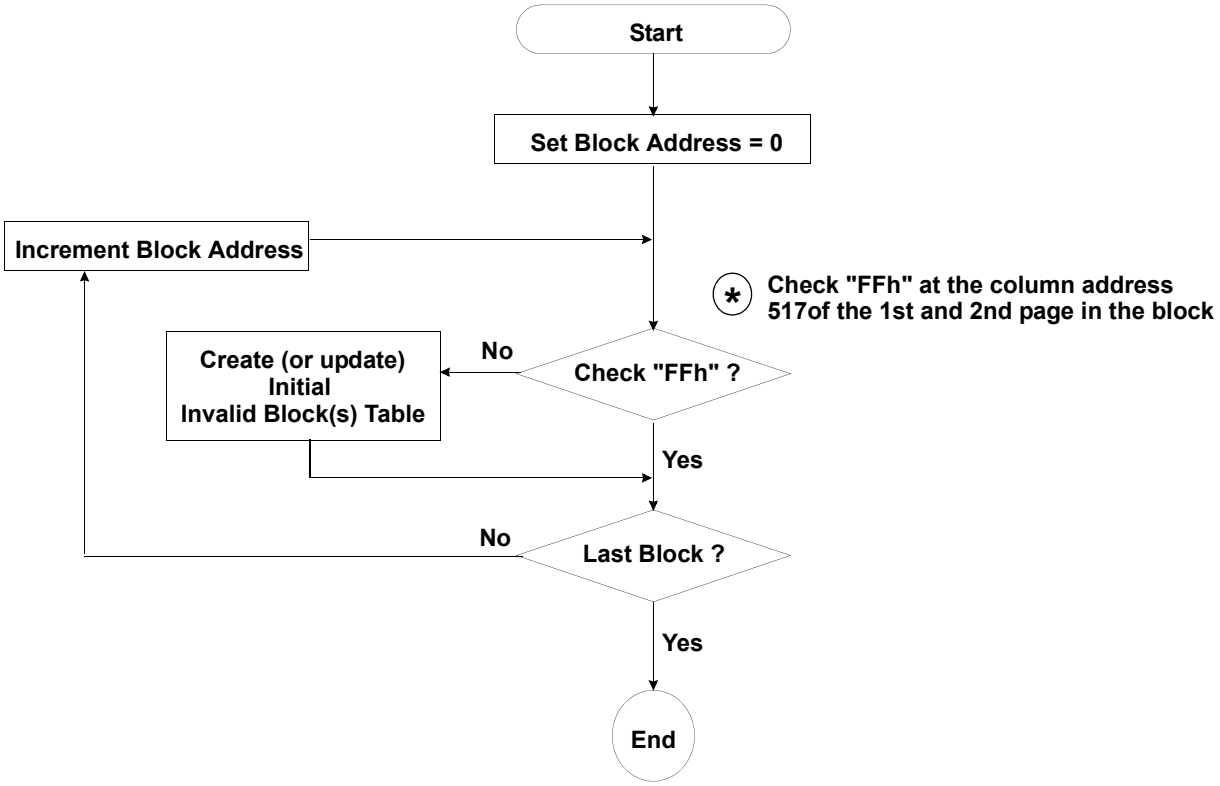

Figure 3. Flow chart to create initial invalid block table.

NAND Flash Technical Notes *(Continued)*

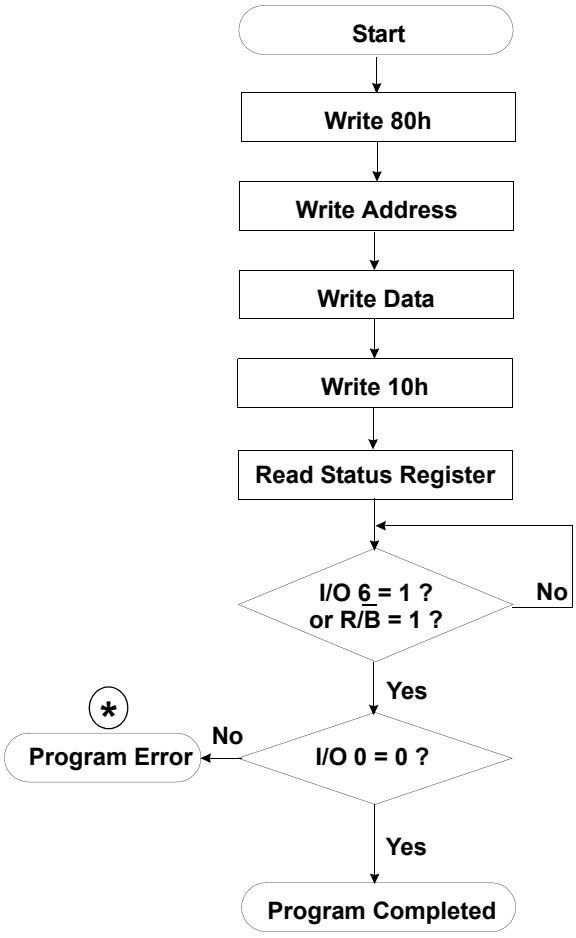
Error in write or read operation

Within its life time, the additional invalid blocks may develop with NAND Flash memory. Refer to the qualification report for the actual data.The following possible failure modes should be considered to implement a highly reliable system. In the case of status read failure after erase or program, block replacement should be done. Because program status fail during a page program does not affect the data of the other pages in the same block, block replacement can be executed with a page-sized buffer by finding an erased empty block and reprogramming the current target data and copying the rest of the replaced block. In case of Read, ECC must be employed. To improve the efficiency of memory space, it is recommended that the read or verification failure due to single bit error be reclaimed by ECC without any block replacement. The said additional block failure rate does not include those reclaimed blocks.

Failure Mode		Detection and Countermeasure sequence
Write	Erase Failure	Status Read after Erase --> Block Replacement
	Program Failure	Status Read after Program --> Block Replacement
Read	Single Bit Failure	Verify ECC -> ECC Correction

ECC : Error Correcting Code --> Hamming Code etc.
Example) 1bit correction & 2bit detection

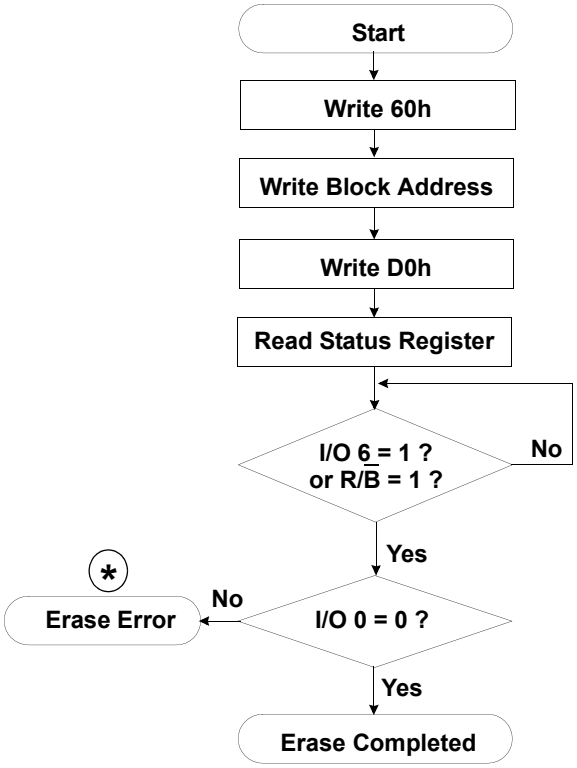
Program Flow Chart



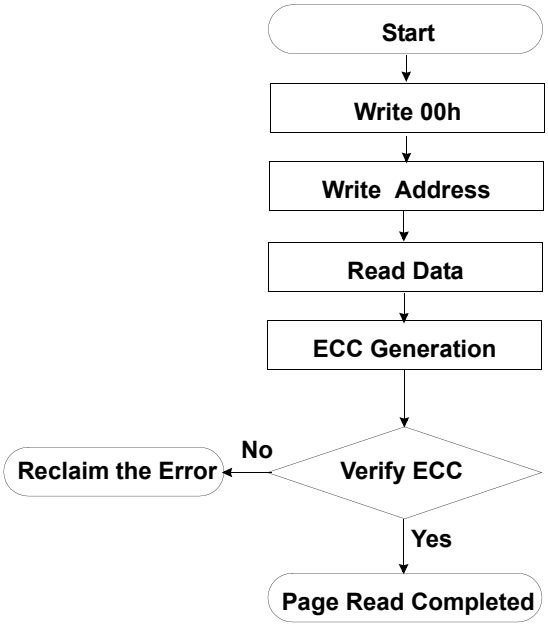
(*) : If program operation results in an error, map out the block including the page in error and copy the target data to another block.

NAND Flash Technical Notes *(Continued)*

Erase Flow Chart

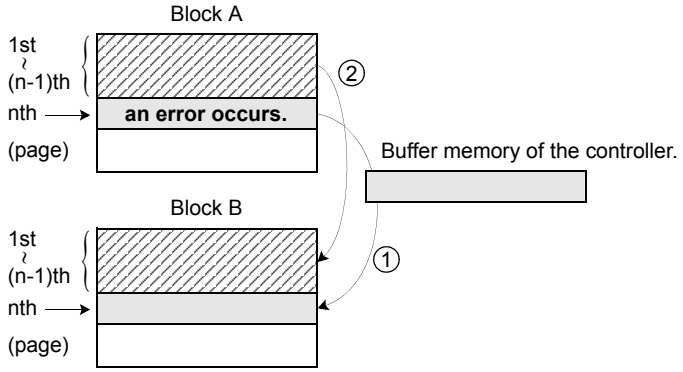


Read Flow Chart



(*) : If erase operation results in an error, map out the failing block and replace it with another block.

Block Replacement



* Step1
When an error happens in the nth page of the Block 'A' during erase or program operation.
* Step2
Copy the nth page data of the Block 'A' in the buffer memory to the nth page of another free block. (Block 'B')
* Step3
Then, copy the data in the 1st ~ (n-1)th page to the same location of the Block 'B'.
* Step4
Do not further erase Block 'A' by creating an 'invalid Block' table or other appropriate scheme.

Pointer Operation of K9F5608X0D(X8)

Samsung NAND Flash has three address pointer commands as a substitute for the two most significant column addresses. '00h' command sets the pointer to 'A' area(0~255byte), '01h' command sets the pointer to 'B' area(256~511byte), and '50h' command sets the pointer to 'C' area(512~527byte). With these commands, the starting column address can be set to any of a whole page(0~527byte). '00h' or '50h' is sustained until another address pointer command is inputted. '01h' command, however, is effective only for one operation. After any operation of Read, Program, Erase, Reset, Power_Up is executed once with '01h' command, the address pointer returns to 'A' area by itself. To program data starting from 'A' or 'C' area, '00h' or '50h' command must be inputted before '80h' command is written. A complete read operation prior to '80h' command is not necessary. To program data starting from 'B' area, '01h' command must be inputted right before '80h' command is written.

Table 2. Destination of the pointer

Command	Pointer position	Area
00h	0 ~ 255 byte	1st half array(A)
01h	256 ~ 511 byte	2nd half array(B)
50h	512 ~ 527 byte	spare array(C)

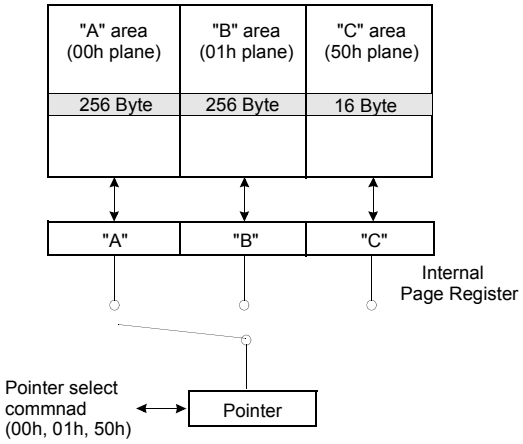


Figure 4. Block Diagram of Pointer Operation

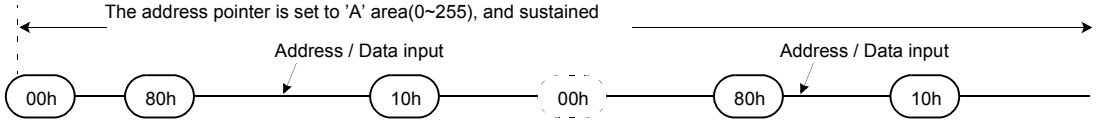
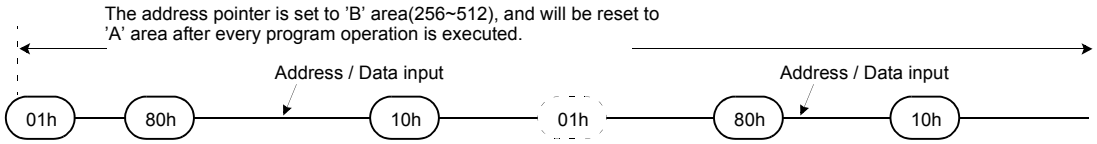
(1) Command input sequence for programming 'A' area



'A','B','C' area can be programmed.
It depends on how many data are inputted.

'00h' command can be omitted.

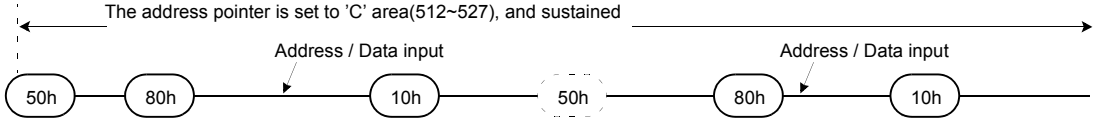
(2) Command input sequence for programming 'B' area



'B', 'C' area can be programmed.
It depends on how many data are inputted.

'01h' command must be rewritten before
every program operation

(3) Command input sequence for programming 'C' area



Only 'C' area can be programmed.

'50h' command can be omitted.

System Interface Using $\overline{CE}$ don't-care.

For an easier system interface, $\overline{CE}$ may be inactive during the data-loading or sequential data-reading as shown below. The internal 528byte page registers are utilized as seperate buffers for this operation and the system design gets more flexible. In addition, for voice or audio applications which use slow cycle time on the order of u-seconds, de-activating $\overline{CE}$ during the data-loading and reading would provide significant savings in power consumption.

Figure 6. Program Operation with $\overline{CE}$ don't-care.

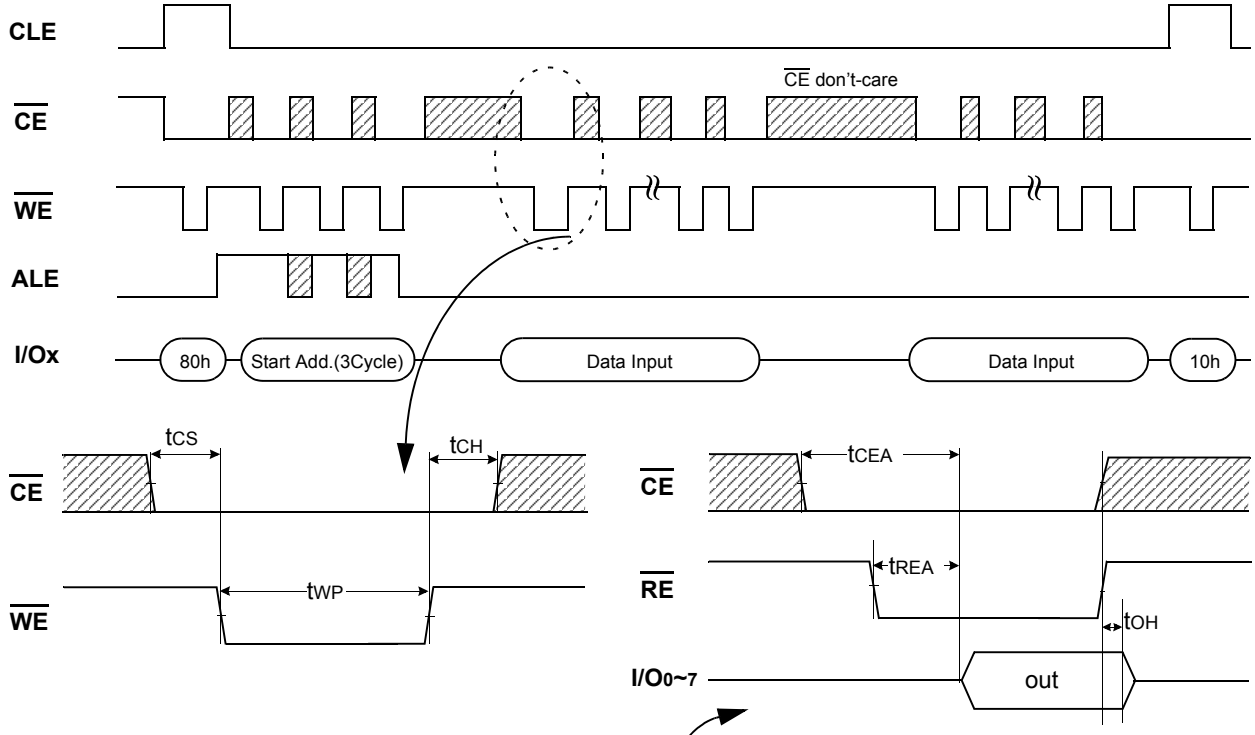


Figure 7. Read Operation with $\overline{CE}$ don't-care.

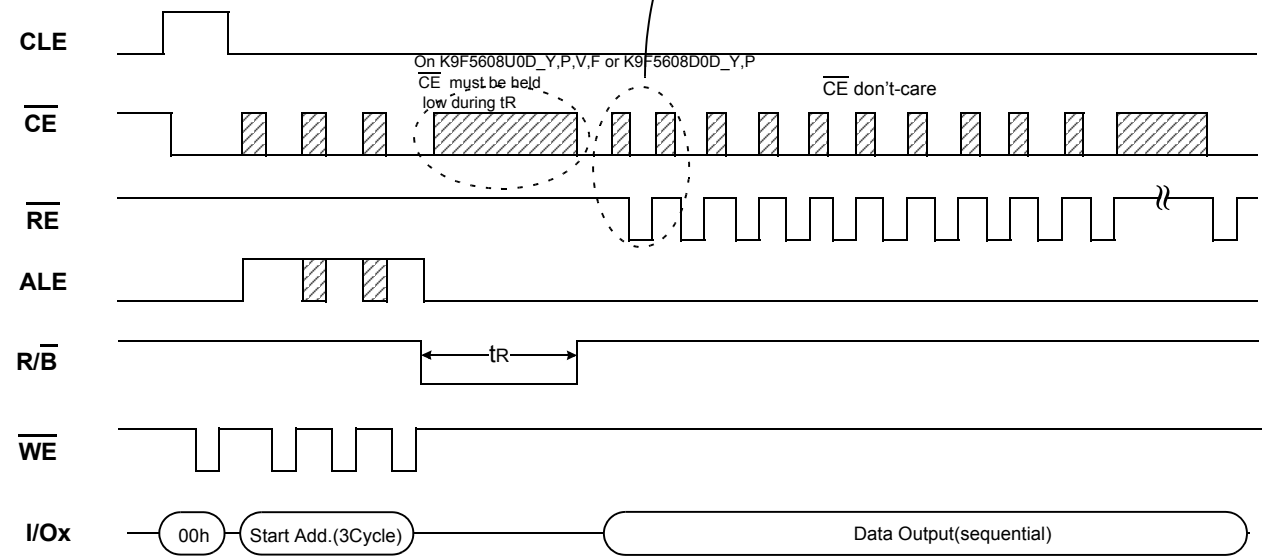
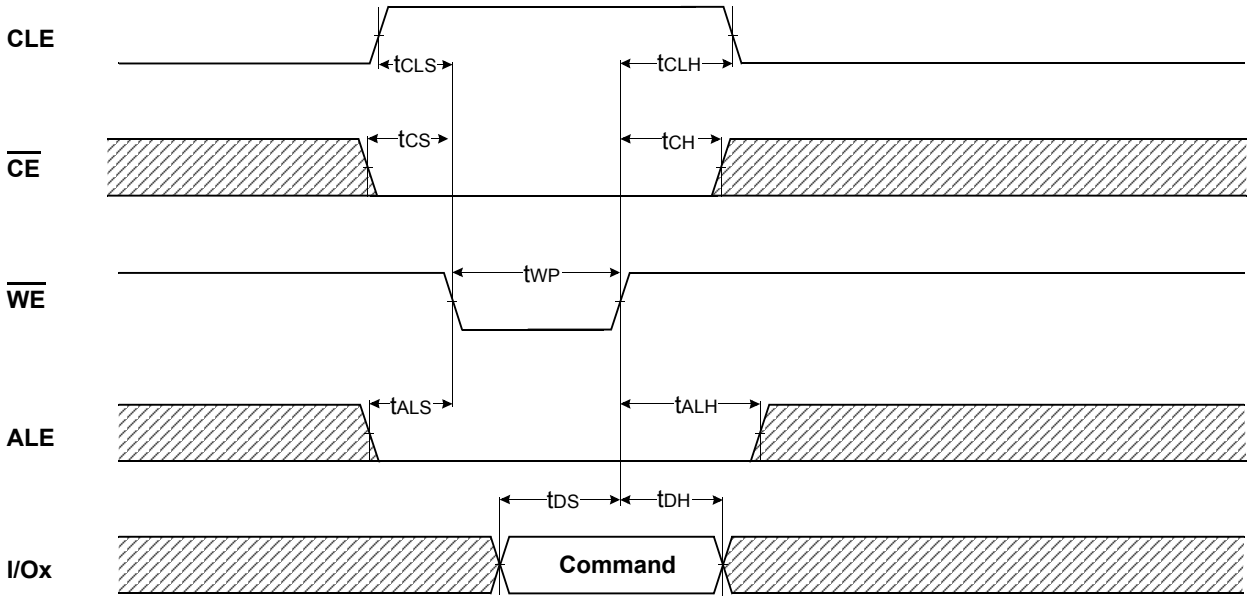


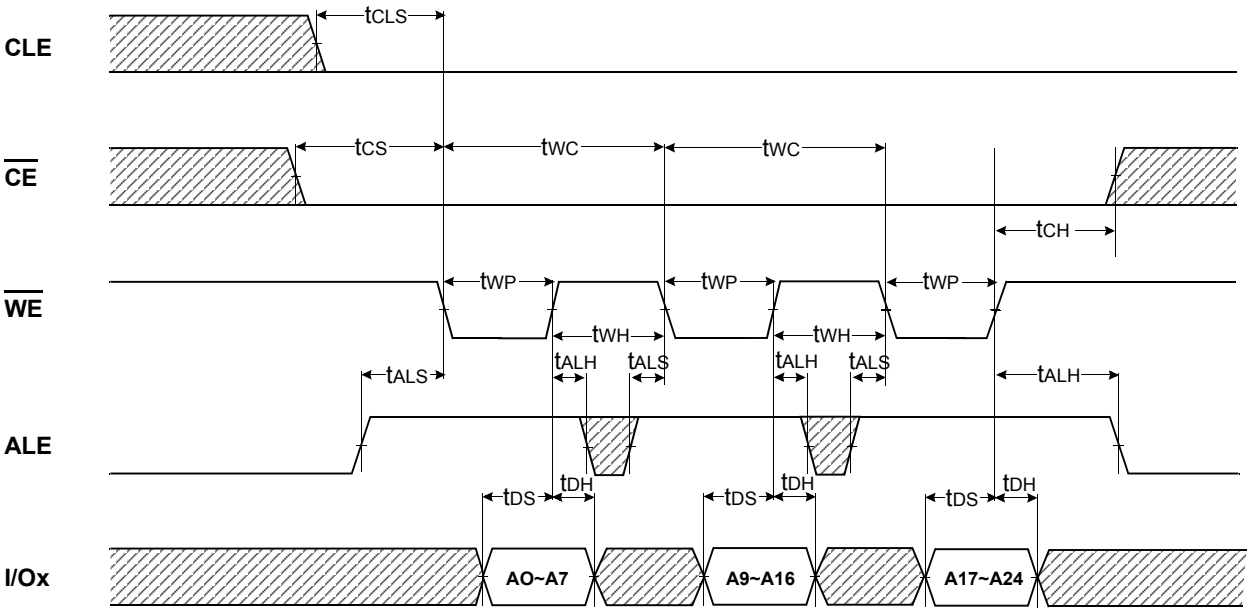
Device	I/O	DATA
	I/Ox	Data In/Out
K9F5608X0D(X8 device)	I/O 0 ~ I/O 7	~528byte

NOTE: 1. I/O8~15 must be set to "0" during command or address input.
I/O8~15 are used only for data bus.

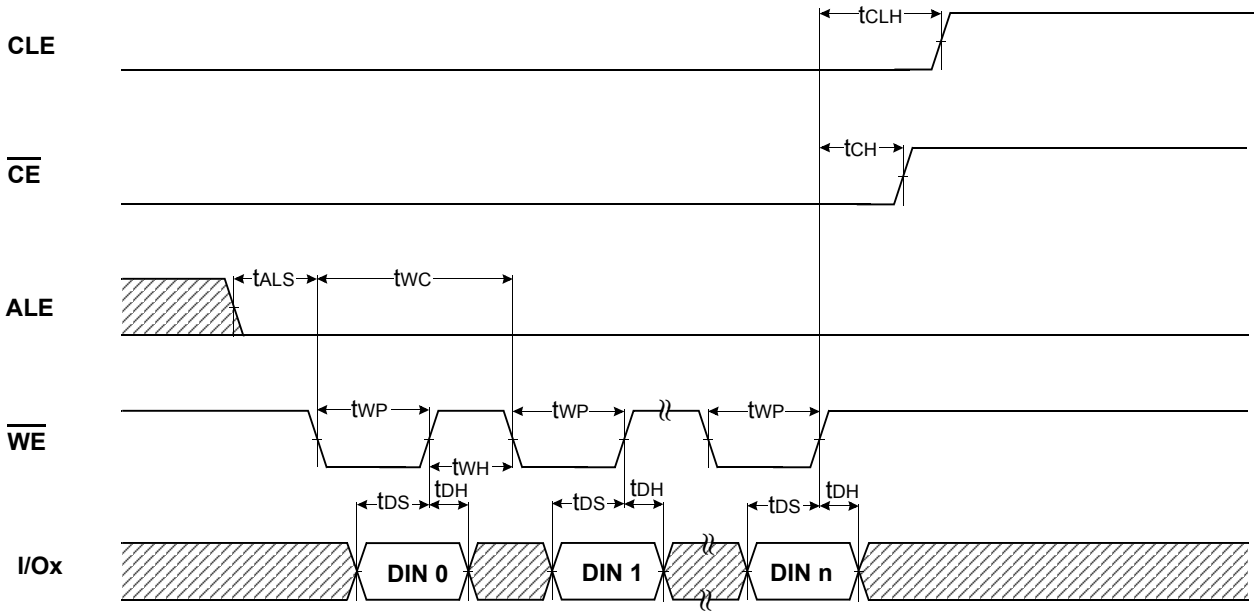
Command Latch Cycle



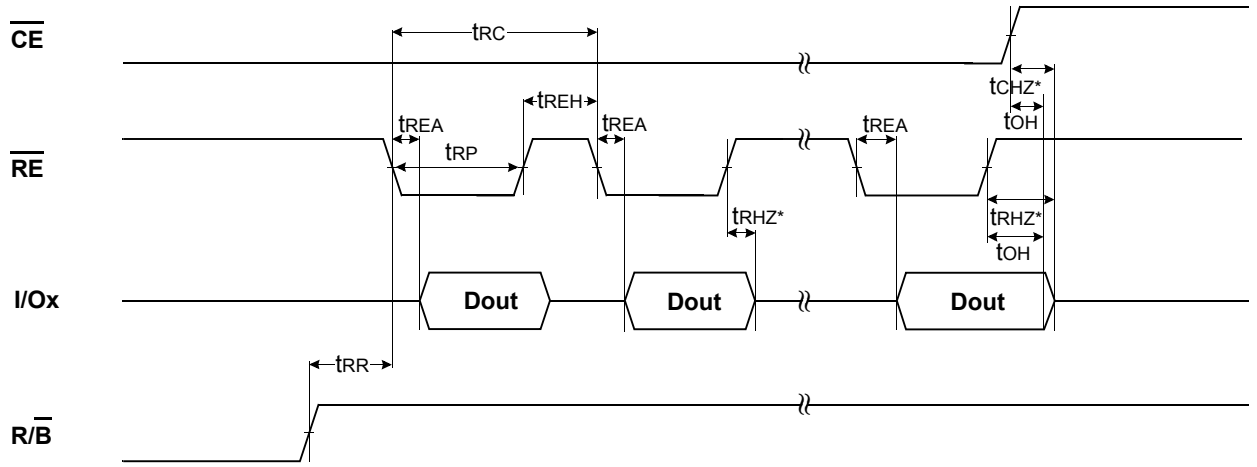
Address Latch Cycle



Input Data Latch Cycle

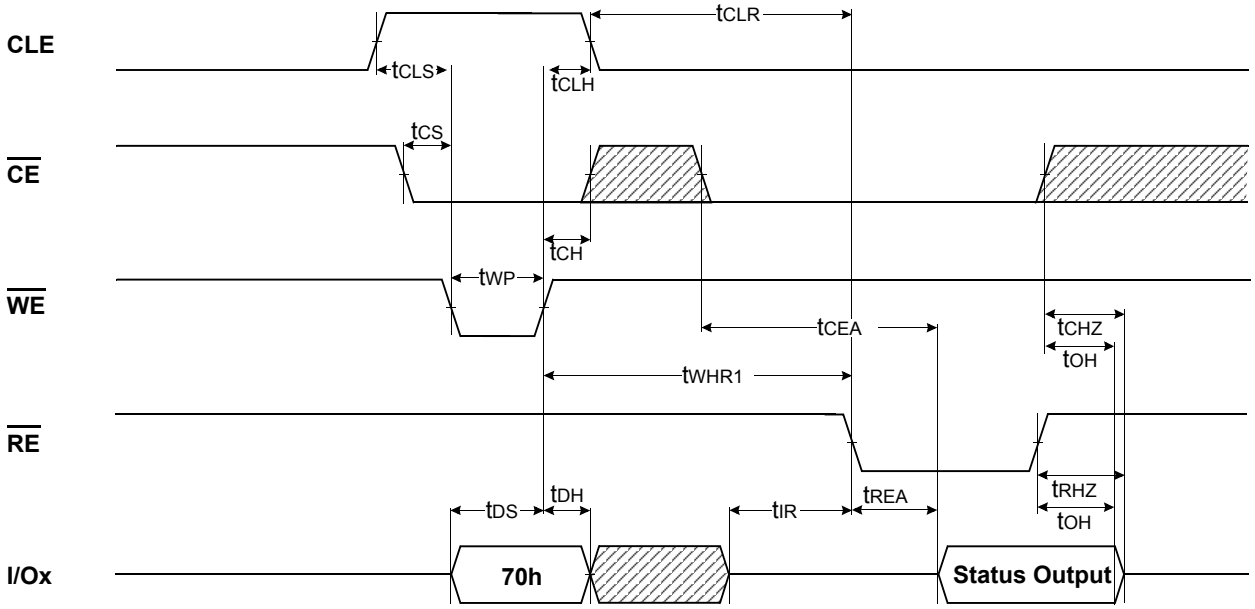


Sequential Out Cycle after Read(CLE=L, $\overline{WE}$=H, ALE=L)

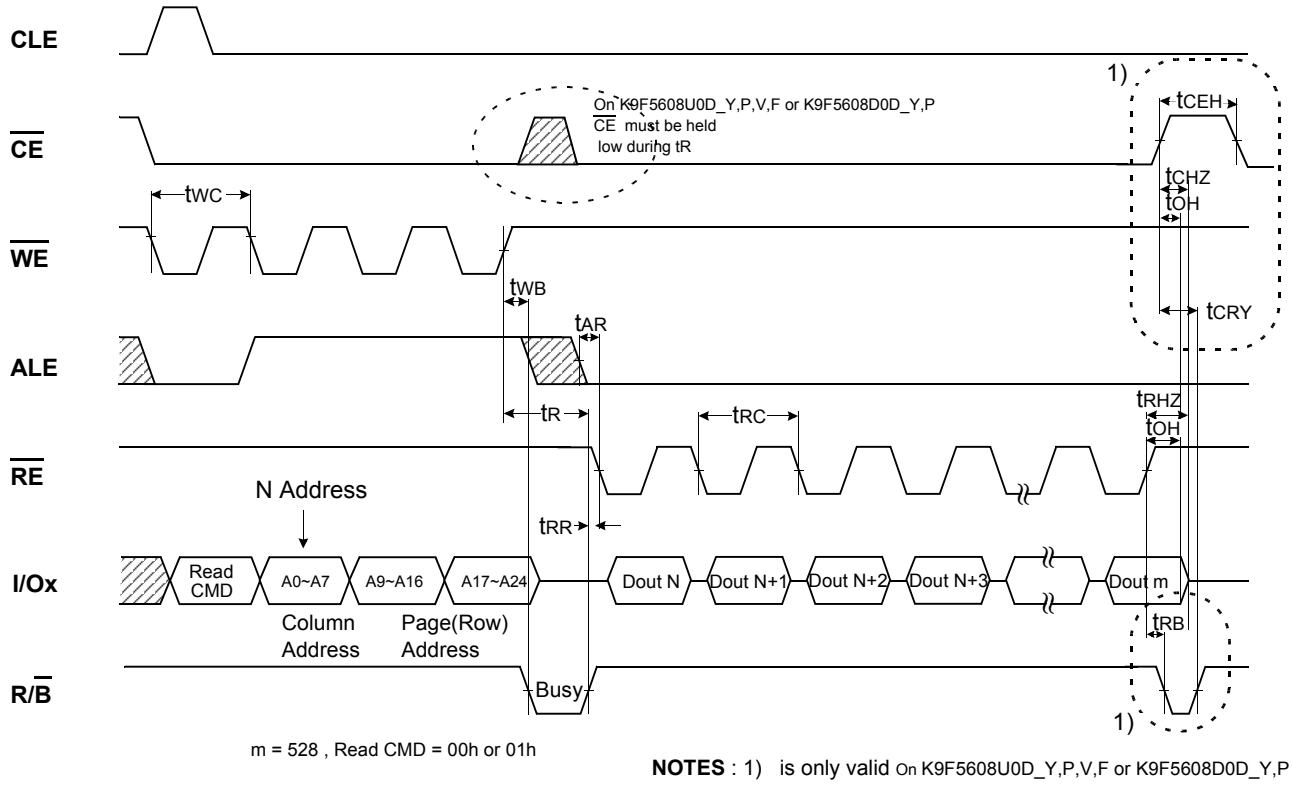


NOTES : Transition is measured ±200mV from steady state voltage with load.
This parameter is sampled and not 100% tested.

Status Read Cycle



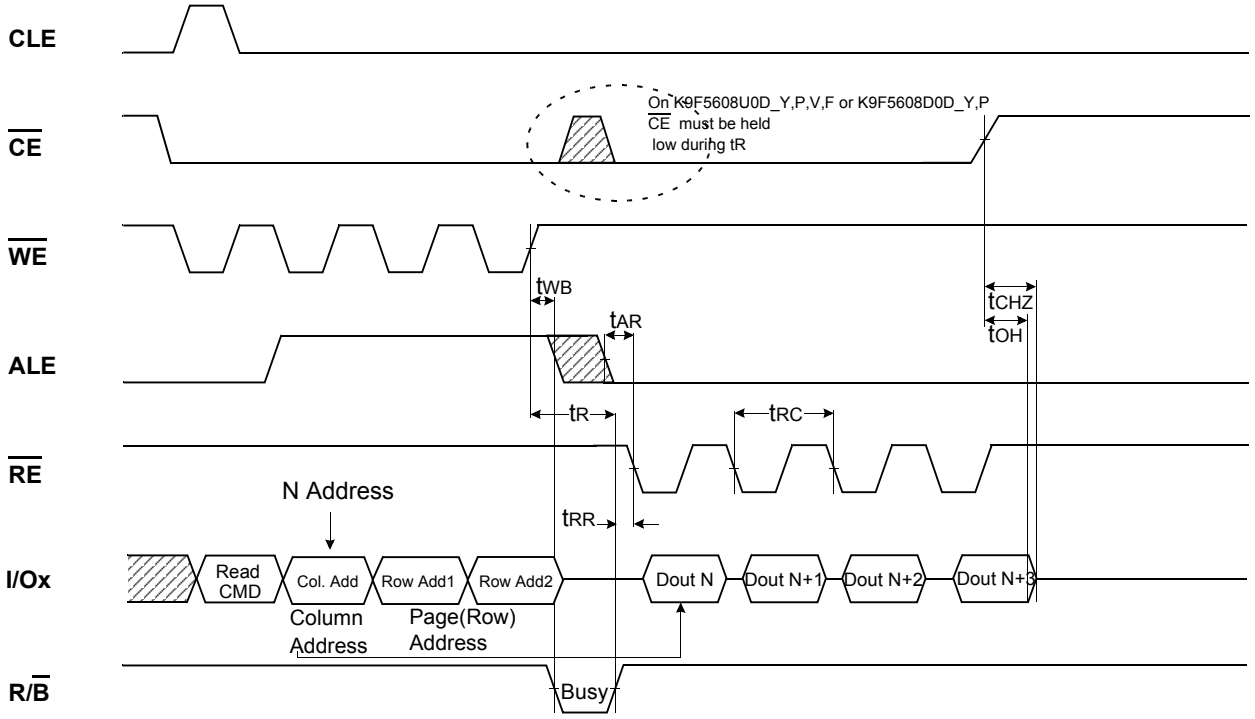
Read1 Operation (Read One Page)



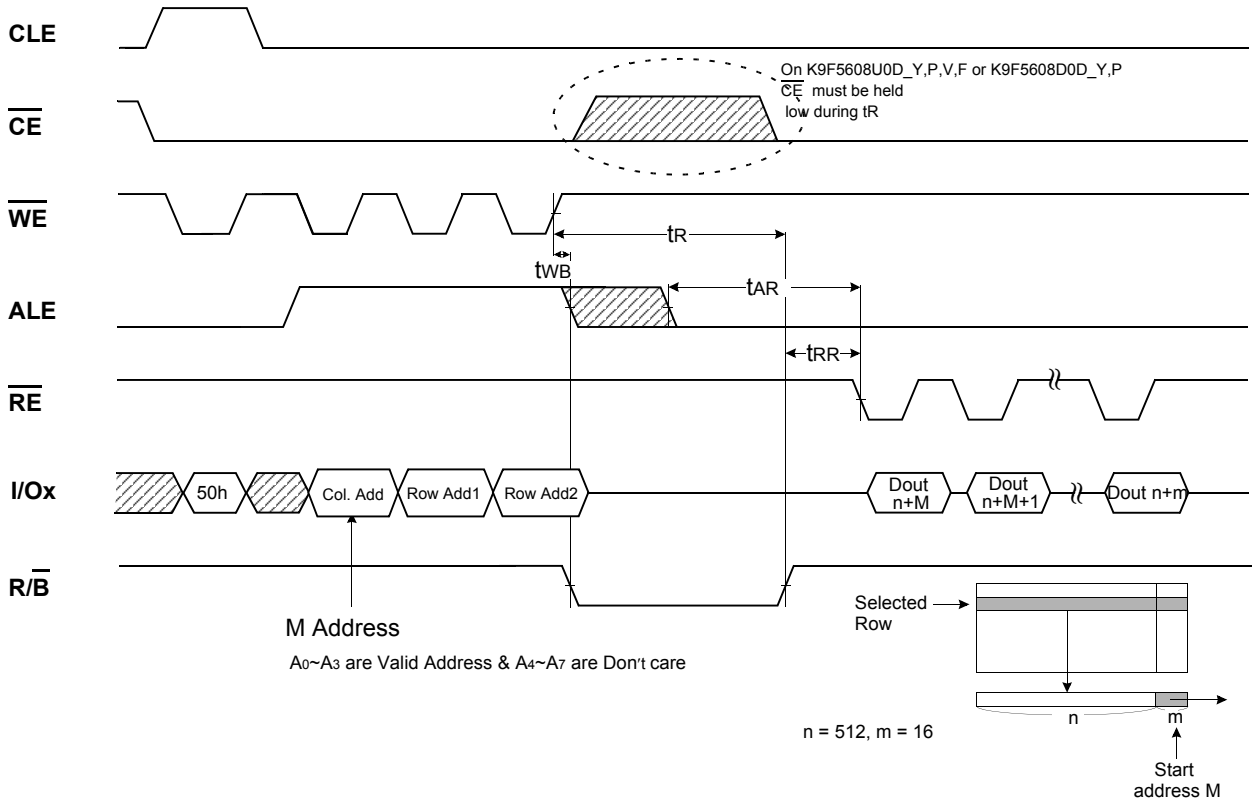
m = 528 , Read CMD = 00h or 01h

NOTES : 1) is only valid On K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P

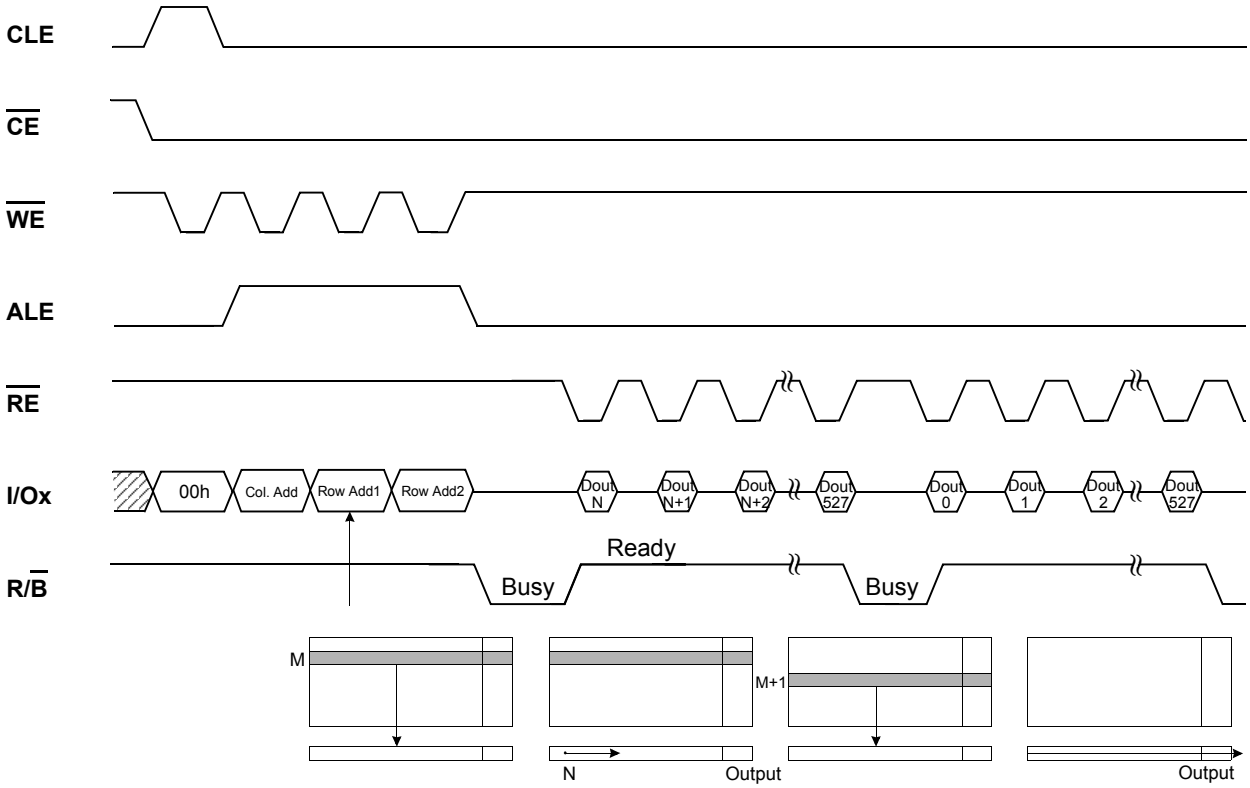
Read1 Operation (Intercepted by $\overline{CE}$)



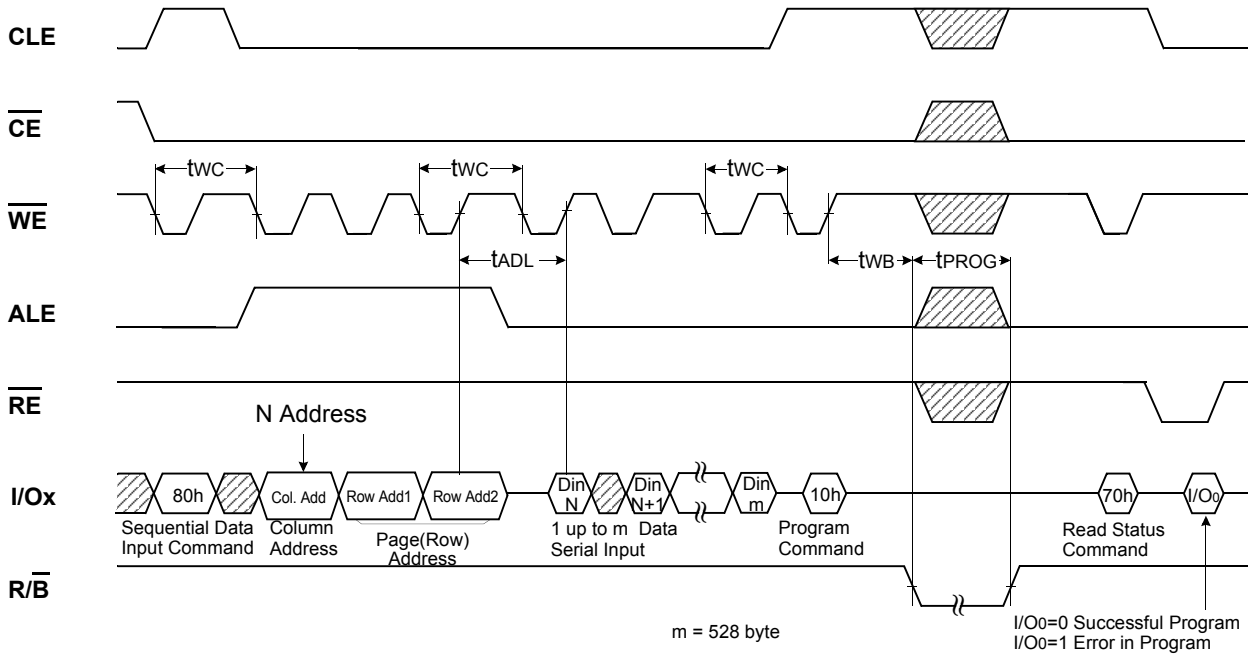
Read2 Operation (Read One Page)



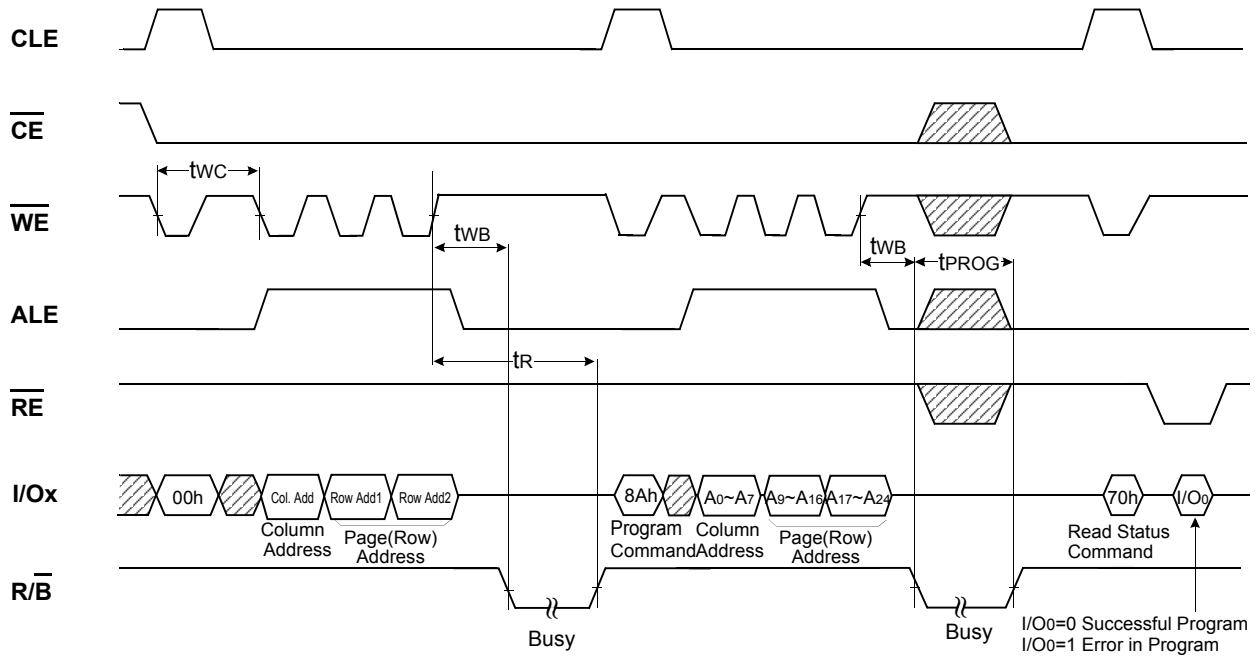
Sequential Row Read Operation (only for On K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P)



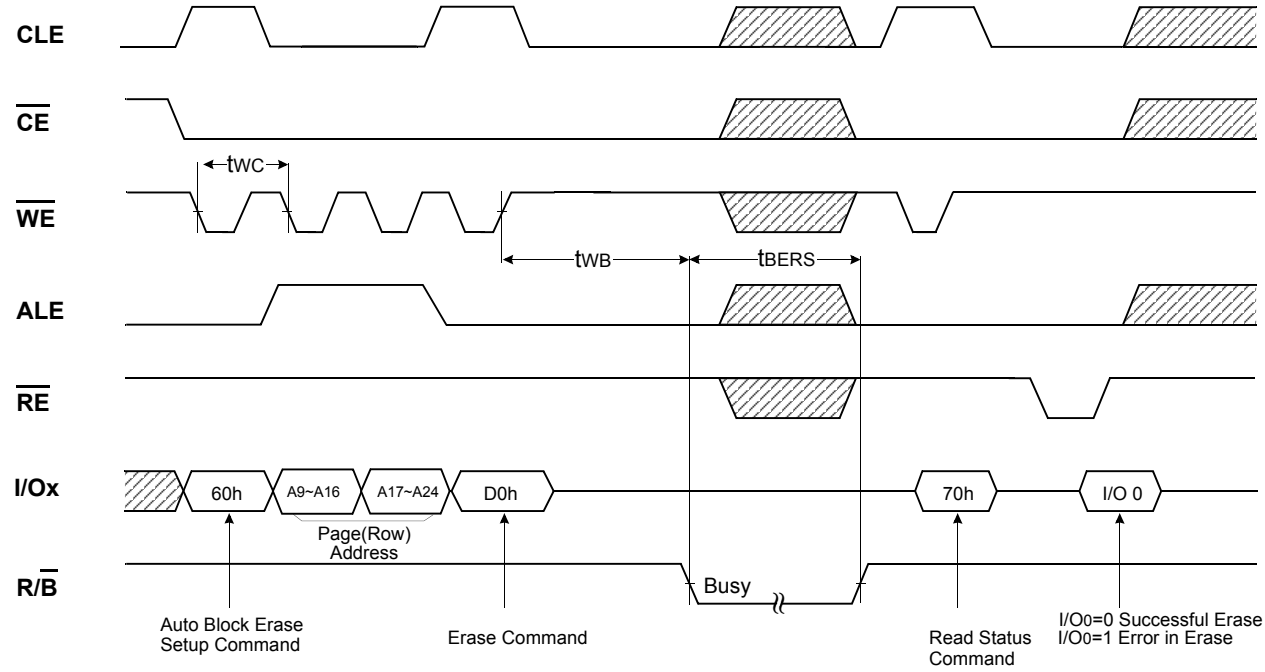
Page Program Operation



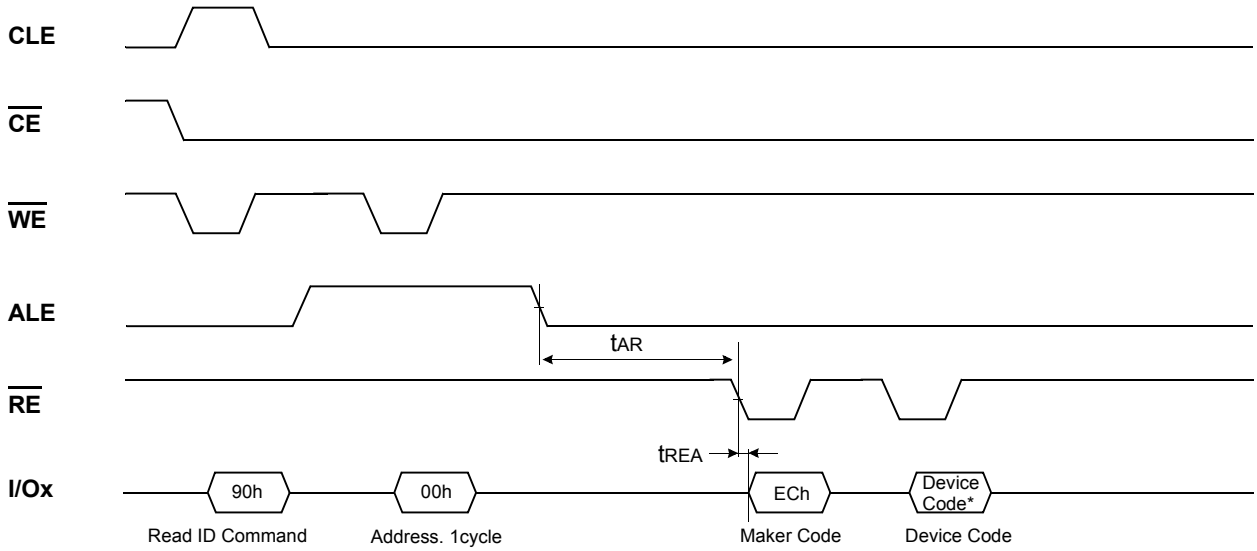
Copy-Back Program Operation



Block Erase Operation (Erase One Block)



Manufacture & Device ID Read Operation



Device	Device Code*
K9F5608R0D	35h
K9F5608D0D	75h
K9F5608U0D	75h

DEVICE OPERATION

PAGE READ

Upon initial device power up, the device defaults to Read1 mode. This operation is also initiated by writing 00h to the command register along with three address cycles. Once the command is latched, it does not need to be written for the following page read operation. Two types of operations are available : random read, serial page read.

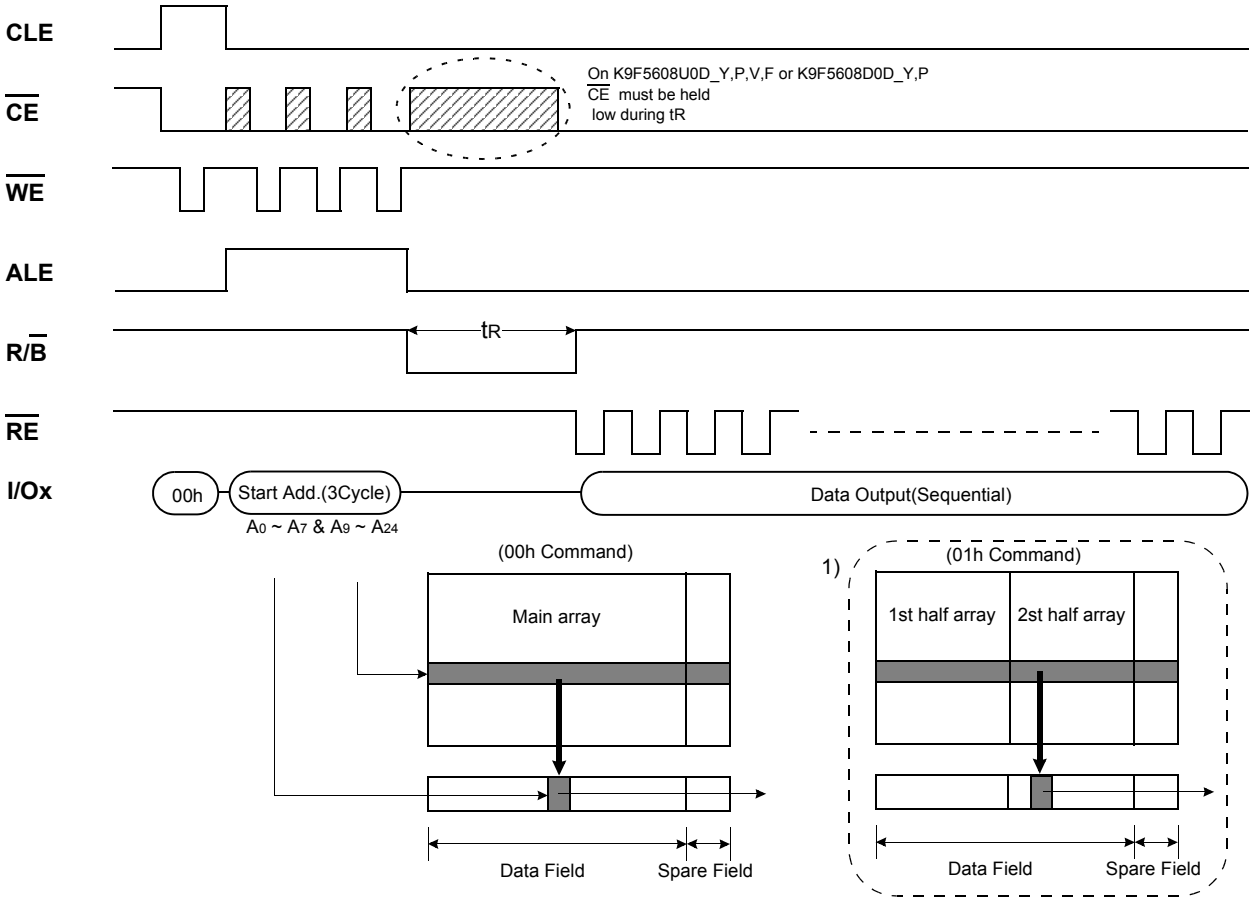
The random read mode is enabled when the page address is changed. The 528 byte of data within the selected page are transferred to the data registers in less than 15μs(t_R). The system controller can detect the completion of this data transfer(tR) by analyzing the output of R/$\overline{B}$ pin. Once the data in a page is loaded into the registers, they may be read out in 50ns cycle time by sequentially pulsing $\overline{RE}$. High to low transitions of the $\overline{RE}$ clock output the data starting from the selected column address up to the last column address.

The way the Read1 and Read2 commands work is like a pointer set to either the main area or the spare area. Addresses A_0~A_3 set the starting address of the spare area while addresses A_4~A_7 are ignored . The Read1 command is needed to move the pointer back to the main area. Figures 8,9 show typical sequence and timings for each read operation.

Sequential Row Read is available only on K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P :

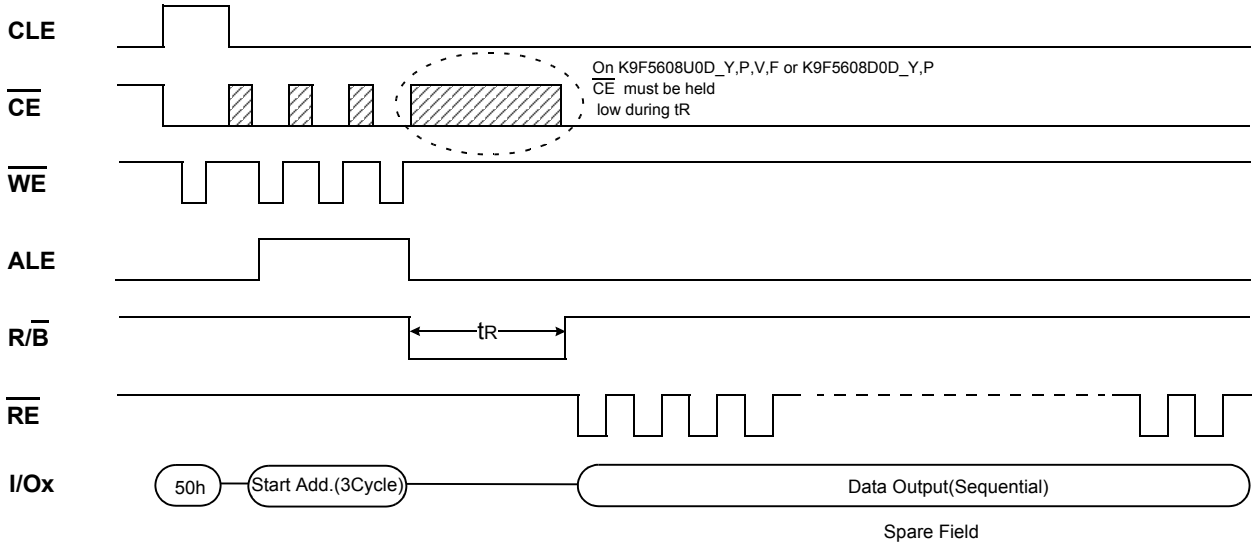
After the data of last column address is clocked out, the next page is automatically selected for sequential row read. Waiting 15μs again allows reading the selected page. The sequential row read operation is terminated by bringing $\overline{CE}$ high. Unless the operation is aborted, the page address is automatically incremented for sequential row read as in Read1 operation and spare sixteen bytes of each page may be sequentially read. The Sequential Read 1 and 2 operations are allowed only within a block and after the last page of a block being readout, the sequential read operation must be terminated by bringing $\overline{CE}$ high. When the page address moves onto the next block, read command and address must be given. Figures 8-1, 9-1 show typical sequence and timings for sequential row read operation.

Figure8. Read1 Operation



NOTE: 1) After data access on 2nd half array by 01h command, the start pointer is automatically moved to 1st half array (00h) at next cycle.

Figure 9. Read2 Operation



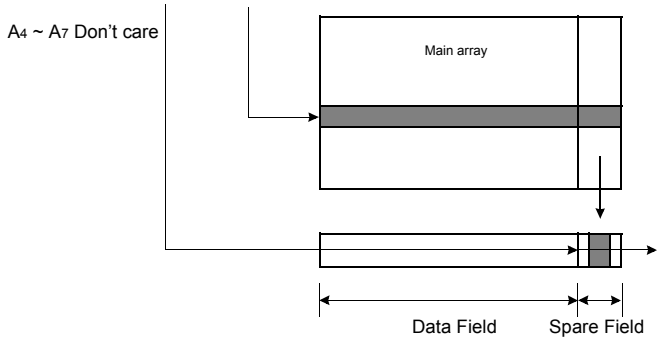


Figure 8-1. Sequential Row Read1 Operation (only for K9F5608U0D_Y,P,V,F or K9F5608D0D_Y,P)

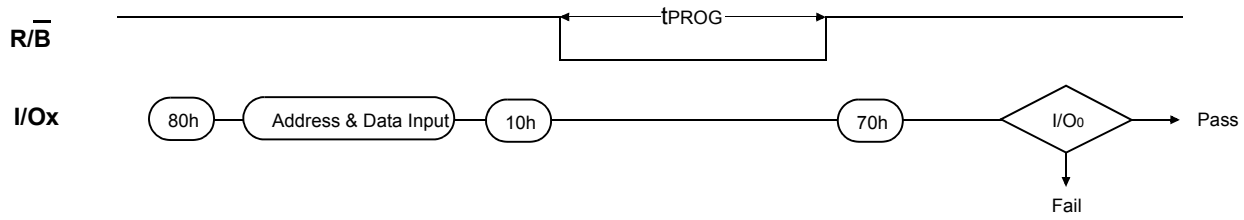
PAGE PROGRAM

The device is programmed basically on a page basis, but it does allow multiple partial page programing of a byte/word or consecutive bytes/words up to 528, in a single page program cycle. The number of consecutive partial page programming operation within the same page without an intervening erase operation should not exceed 2 for main array and 3 for spare array. The addressing may be done in any random order in a block. A page program cycle consists of a serial data loading period in which up to 528 bytes of data may be loaded into the page register, followed by a non-volatile programming period where the loaded data is programmed into the appropriate cell. About the pointer operation, please refer to the attached technical notes.
The serial data loading period begins by inputting the Serial Data Input command(80h), followed by the three cycle address input and then serial data loading. The words other than those to be programmed do not need to be loaded.The Page Program confirm command(10h) initiates the programming process. Writing 10h alone without previously entering the serial data will not initiate the programming process. The internal write controller automatically executes the algorithms and timings necessary for program and verify, thereby freeing the system controller for other tasks. Once the program process starts, the Read Status Register command may be entered, with $\overline{RE}$ and $\overline{CE}$ low, to read the status register. The system controller can detect the completion of a program cycle by monitoring the R/$\overline{B}$ output, or the Status bit(I/O 6) of the Status Register. Only the Read Status command and Reset command are valid while programming is in progress. When the Page Program is complete, the Write Status Bit(I/O 0) may be checked(Figure 10). The internal write verify detects only errors for "1"s that are not successfully programmed to "0"s. The command register remains in Read Status command mode until another valid command is written to the command register.

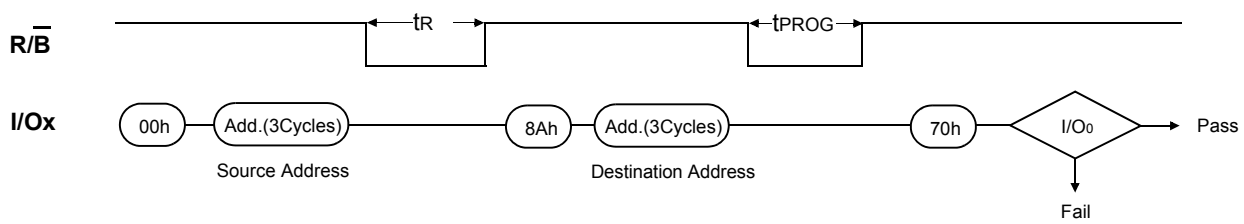
Figure 10. Program Operation



COPY-BACK PROGRAM

The copy-back program is configured to quickly and efficiently rewrite data stored in one page within the array to another page within the same array without utilizing an external memory. Since the time-consuming sequently-reading and its re-loading cycles are removed, the system performance is improved. The benefit is especially obvious when a portion of a block is updated and the rest of the block also need to be copied to the newly assigned free block. The operation for performing a copy-back is a sequential execution of page-read without burst-reading cycle and copying-program with the address of destination page. A normal read operation with "00h" command with the address of the source page moves the whole 528bytes data into the internal buffer. As soon as the Flash returns to Ready state, copy-back programming command "8Ah" may be given with three address cycles of target page followed. The data stored in the internal buffer is then programmed directly into the memory cells of the destination page. Once the Copy-Back Program is finished, any additional partial page programming into the copied pages is prohibited before erase. Since the memory array is internally partitioned into two different planes, copy-back program is allowed only within the same memory plane. Thus, A14, the plane address, of source and destination page address must be the same.**"When there is a program-failure at Copy-Back operation, error is reported by pass/fail status. But if the soure page has a bit error for charge loss, accumulated copy-back operations could also accumulate bit errors. For this reason, two bit ECC is recommended for copy-back operation."**

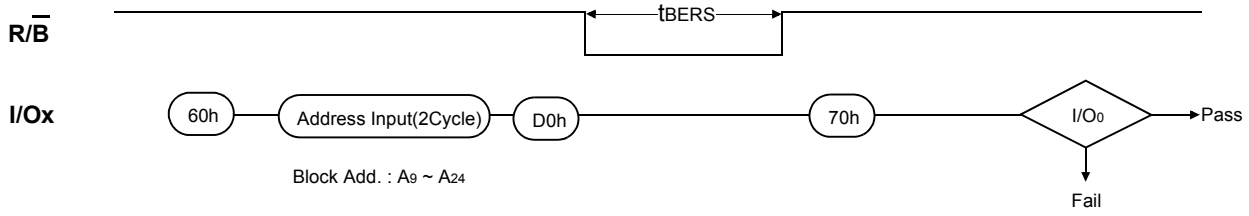
Figure 11. Copy-Back Program Operation



BLOCK ERASE

The Erase operation is done on a block basis. Block address loading is accomplished in two cycles initiated by an Erase Setup command(60h). Only address A_{14} to A_{24} is valid while A_9 to A_{13} is ignored. The Erase Confirm command(D0h) following the block address loading initiates the internal erasing process. This two-step sequence of setup followed by execution command ensures that memory contents are not accidentally erased due to external noise conditions.
At the rising edge of $\overline{WE}$ after the erase confirm command input, the internal write controller handles erase and erase-verify. When the erase operation is completed, the Write Status Bit(I/O 0) may be checked. Figure 12 details the sequence.

Figure 12. Block Erase Operation



READ STATUS

The device contains a Status Register which may be read to find out whether program or erase operation is completed, and whether the program or erase operation is completed successfully. After writing 70h command to the command register, a read cycle outputs the content of the Status Register to the I/O pins on the falling edge of $\overline{CE}$ or $\overline{RE}$, whichever occurs last. This two line control allows the system to poll the progress of each device in multiple memory connections even when R/$\overline{B}$ pins are common-wired. $\overline{RE}$ or $\overline{CE}$ does not need to be toggled for updated status. Refer to table 4 for specific Status Register definitions. The command register remains in Status Read mode until further commands are issued to it. Therefore, if the status register is read during a random read cycle, a read command(00h or 50h) should be given before sequential page read cycle.

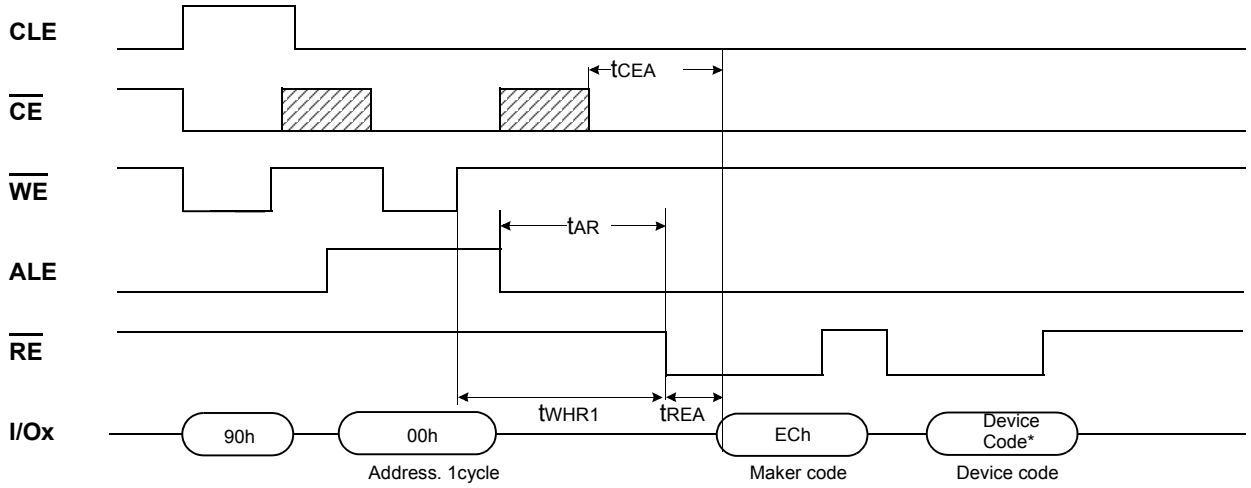
Table4. Read Status Register Definition

I/O #	Status	Definition
I/O 0	Program / Erase	"0" : Successful Program / Erase
		"1" : Error in Program / Erase
I/O 1	Reserved for Future Use	"0"
I/O 2		"0"
I/O 3		"0"
I/O 4		"0"
I/O 5		"0"
I/O 6	Device Operation	"0" : Busy "1" : Ready
I/O 7	Write Protect	"0" : Protected "1" : Not Protected

READ ID

The device contains a product identification mode, initiated by writing 90h to the command register, followed by an address input of 00h. Two read cycles sequentially output the manufacture code(ECh), and the device code respectively. The command register remains in Read ID mode until further commands are issued to it. Figure 13 shows the operation sequence.

Figure 13. Read ID Operation



Device	Device Code*
K9F5608R0D	35h
K9F5608D0D	75h
K9F5608U0D	75h

RESET

The device offers a reset feature, executed by writing FFh to the command register. When the device is in Busy state during random read, program or erase mode, the reset operation will abort these operations. The contents of memory cells being altered are no longer valid, as the data will be partially programmed or erased. The command register is cleared to wait for the next command, and the Status Register is cleared to value C0h when $\overline{WP}$ is high. Refer to table 5 for device status after reset operation. If the device is already in reset state a new reset command will not be accepted by the command register. The R/$\overline{B}$ pin transitions to low for tRST after the Reset command is written. Refer to Figure 14 below.

Figure 14. RESET Operation

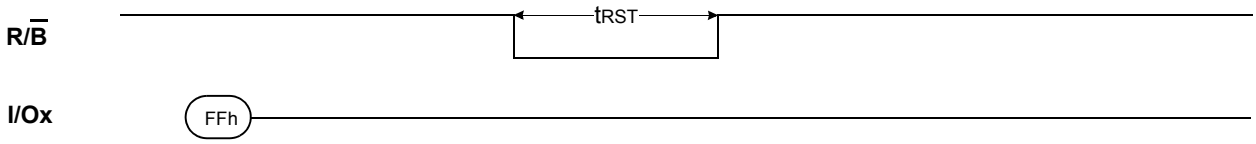


Table5. Device Status

	After Power-up	After Reset
Operation Mode	Read 1	Waiting for next command

READY/$\overline{BUSY}$

The device has a R/$\overline{B}$ output that provides a hardware method of indicating the completion of a page program, erase and random read completion. The R/$\overline{B}$ pin is normally high but transitions to low after program or erase command is written to the command register or random read is started after address loading. It returns to high when the internal controller has finished the operation. The pin is an open-drain driver thereby allowing two or more R/$\overline{B}$ outputs to be Or-tied. Because pull-up resistor value is related to tr(R/$\overline{B}$) and current drain during busy(ibusy) , an appropriate value can be obtained with the following reference chart(Fig 15). Its value can be determined by the following guidance.

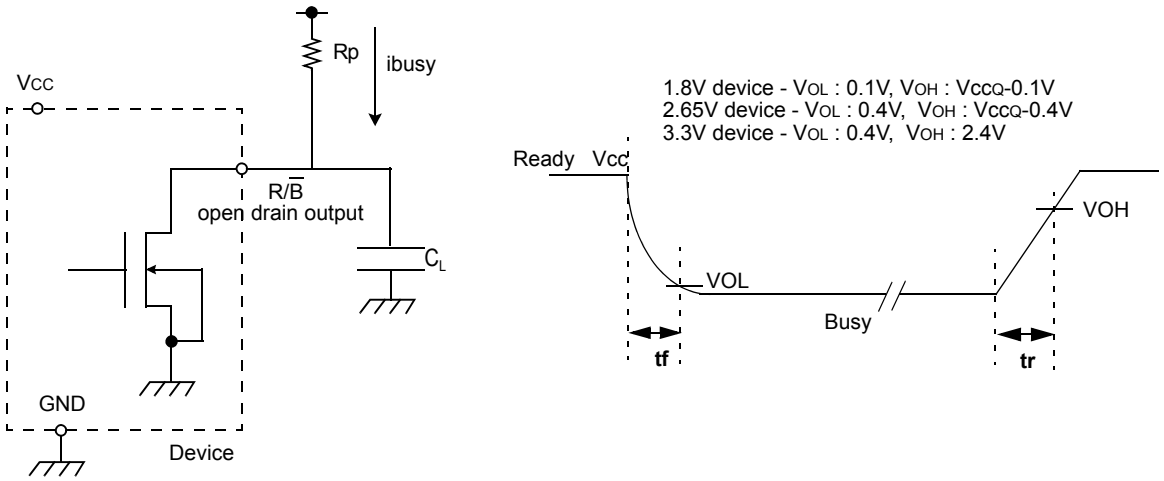

Figure 15. Rp vs tr ,tf & Rp vs ibusy

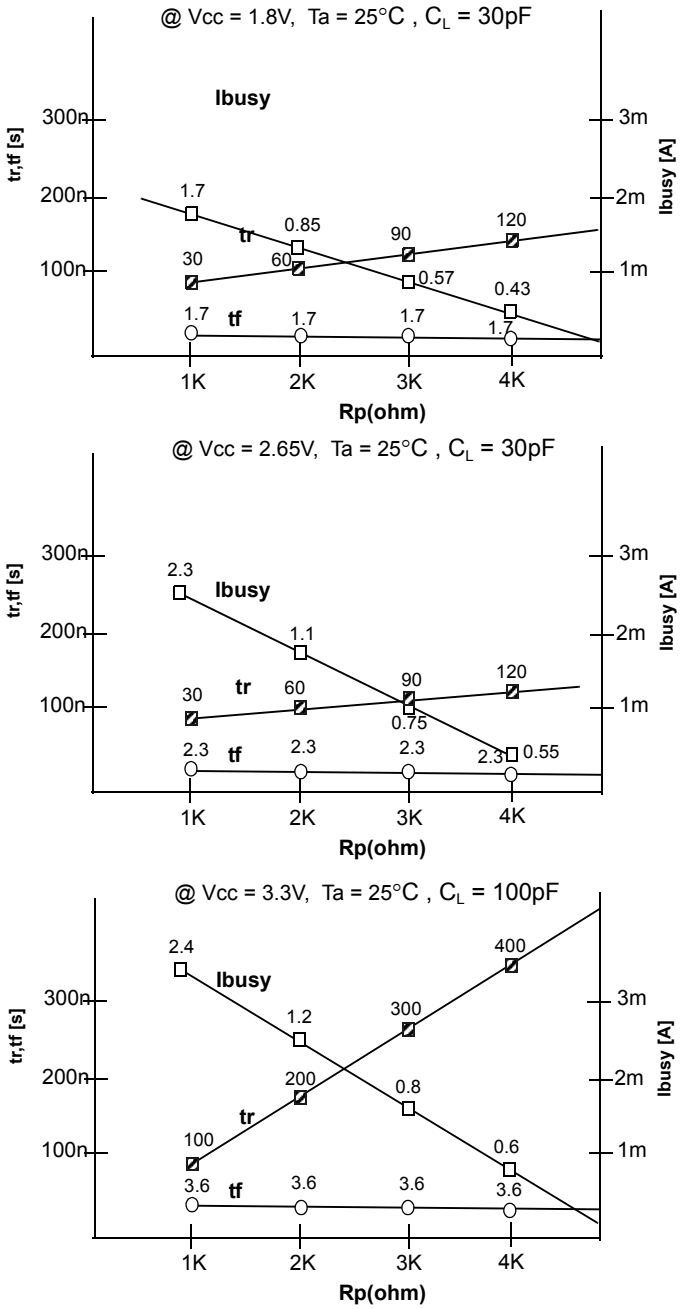

Rp value guidance

$$Rp(min, 1.8V part) = \frac{V_{CC}(Max.) - V_{OL}(Max.)}{I_{OL} + \Sigma I_L} = \frac{1.85V}{3mA + \Sigma I_L}$$

$$Rp(min, 2.65V part) = \frac{V_{CC}(Max.) - V_{OL}(Max.)}{I_{OL} + \Sigma I_L} = \frac{2.5V}{3mA + \Sigma I_L}$$

$$Rp(min, 3.3V part) = \frac{V_{CC}(Max.) - V_{OL}(Max.)}{I_{OL} + \Sigma I_L} = \frac{3.2V}{8mA + \Sigma I_L}$$

where I_L is the sum of the input currents of all devices tied to the R/$\overline{B}$ pin.

Rp(max) is determined by maximum permissible limit of tr

Data Protection & Power up sequence

The device is designed to offer protection from any involuntary program/erase during power-transitions. An internal voltage detector disables all functions whenever Vcc is below about 1.1V(1.8V device), 1.8V(2.65V device), 2V(3.3V device). $\overline{WP}$ pin provides hardware protection and is recommended to be kept at V_{IL} during power-up and power-down and recovery time of minimum 10μs is required before internal circuit gets ready for any command sequences as shown in Figure 16. The two step command sequence for program/erase provides additional software protection.

Figure 16. AC Waveforms for Power Transition
