
SINGLE-ENDED, ANALOG-INPUT 24-BIT, 96-kHz STEREO A/D CONVERTER

FEATURES

- 24-Bit Delta-Sigma Stereo A/D Converter
- Single-Ended Voltage Input: 3 V_{p-p}
- High Performance:
 - THD + N: –93 dB (Typical)
 - SNR: 99 dB (Typical)
 - Dynamic Range: 99 dB (Typical)
- Oversampling Decimation Filter:
 - Oversampling Frequency: ×64
 - Pass-Band Ripple: ±0.05 dB
 - Stop-Band Attenuation: –65 dB
 - On-Chip High-Pass Filter: 0.91 Hz (48 kHz)
- Flexible PCM Audio Interface
 - Master/Slave Mode Selectable
 - Data Formats: 24-Bit I²S, 24-Bit Left-Justified
- Power Down and Reset by Halting System Clock
- Analog Antialias LPF Included
- Sampling Rate: 8 kHz–96 kHz
- System Clock: 256 f_S, 384 f_S, 512 f_S
- Dual Power Supplies:
 - 5-V for Analog
 - 3.3-V for Digital
- Package: 14-Pin TSSOP

APPLICATIONS

- DVD Recorder
- Digital TV
- AV Amplifier/Receiver
- MD Player
- CD Recorder
- Multitrack Receiver
- Electric Musical Instrument

DESCRIPTION

The PCM1808 is high-performance, low-cost, single-chip, stereo analog-to-digital converter with single-ended analog voltage input. The PCM1808 uses a delta-sigma modulator with 64-times oversampling and includes a digital decimation filter and high-pass filter that removes the dc component of the input signal. For various applications, the PCM1808 supports master and slave mode and two data formats in serial audio interface.

The PCM1808 supports the power-down and reset function by means of halting the system clock.

The PCM1808 is suitable for wide variety of cost-sensitive consumer applications where good performance and operation with a 5-V analog supply and 3.3-V digital supply is required. The PCM1808 is fabricated using a highly advanced CMOS process and is available in a small, 14-pin TSSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision, Inc.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	PCM1808
Analog supply voltage, V_{CC}	–0.3 V to 6.5 V
Digital supply voltage, V_{DD}	–0.3 V to 4 V
Ground voltage differences, AGND, DGND	±0.1 V
Digital input voltage, LRCK, BCK, DOUT	–0.3 V to $(V_{DD} + 0.3 \text{ V}) < 4 \text{ V}$
Digital input voltage, SCKI, MD0, MD1, FMT	–0.3 V to 6.5 V
Analog input voltage, V_{INL} , V_{INR} , V_{REF}	–0.3 V to $(V_{CC} + 0.3 \text{ V}) < 6.5 \text{ V}$
Input current (any pins except supplies)	±10 mA
Ambient temperature under bias, T_A	–40°C to 125°C
Storage temperature, T_{stg}	–55°C to 150°C
Junction temperature, T_J	150°C
Lead temperature (soldering)	260°C, 5 s
Package temperature (reflow, peak)	260°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

SYSTEM CLOCK

The PCM1808 supports $256 f_s$, $384 f_s$ and $512 f_s$ as system clock, where f_s is the audio sampling frequency. The system clock must be supplied on SCKI (pin 6).

The PCM1808 has a system clock detection circuit which automatically senses if the system clock is operating at $256 f_s$, $384 f_s$, or $512 f_s$ in slave mode. In master mode, the system clock frequency must be controlled through the serial control port, which uses MD1 (pin 111) and MD0 (pin 10). The system clock is divided down automatically to generate frequencies of $128 f_s$ and $64 f_s$, which are used to operate the digital filter and the delta-sigma modulator, respectively.

Table 1 shows some typical relationships between sampling frequency and system clock frequency, and Figure 17 shows system clock timing.

Table 1. Sampling Frequency and System Clock Frequency

SAMPLING FREQUENCY (kHz)	SYSTEM CLOCK FREQUENCY (f_{SCLK}) (MHz)		
	$256 f_s$	$384 f_s$	$512 f_s$
8	2.048	3.072	4.096
16	4.096	6.144	8.192
32	8.192	12.288	16.384
44.1	11.2896	16.9344	22.5792
48	12.288	18.432	24.576
64	16.384	24.576	32.768
88.2	22.5792	33.8688	45.1584
96	24.576	36.864	49.152

SYMBOL	PARAMETER	MIN	MAX	UNIT

$t_w(SCKL)$	System clock pulse duration, LOW	8		ns
	System clock duty cycle	40%	60%	

Figure 17. System Clock Timing

FADE-IN AND FADE-OUT FUNCTIONS

The PCM1808 has fade-in and fade-out functions on DOUT (pin 9) to avoid pop noise, and the functions come into operation in some cases as described in several following sections. The level changes from 0 dB to mute or mute to 0 dB are performed using calculated pseudo S-shaped characteristics with zero-cross detection. Because of the zero-cross detection, the time needed for the fade in and fade out depends on the analog input frequency (f_{in}). It takes $48/f_{in}$ until processing is completed. If there is no zero cross during $8192/f_s$, DOUT is faded in or out by force during $48/f_s$ (TIME OUT). Figure 18 illustrates the fade-in and fade-out operation processing.

T0080-01

Figure 18. Fade-In and Fade-Out Operations

POWER ON

The PCM1808 has an internal power-on-reset circuit, and initialization (reset) is performed automatically when the power supply (V_{DD}) exceeds 2.2 V (typical). While $V_{DD} < 2.2$ V (typical), and for 1024 system-clock counts after $V_{DD} > 2.2$ V (typical), the PCM1808 stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of $8960/f_S$ has elapsed. Because the fade-in operation is performed, it takes additional time of $48/f_{in}$ or $48/f_S$ until the data corresponding to the analog input signal is obtained. Figure 19 illustrates the power-on timing and the digital output.

T0014-09

Figure 19. Power-On Timing

CLOCK-HALT POWER-DOWN AND RESET FUNCTION

The PCM1808 has a power-down and reset function, which is triggered by halting SCKI (pin 6) in both master and slave modes. The function is available anytime after power on. Reset and power down are performed automatically 4 μs (minimum) after SCKI is halted. While the clock-halt reset is asserted, the PCM1808 stays in the reset and power-down mode, and DOUT (pin 9) is forced to zero. SCKI must be supplied to release the reset and power-down mode. The digital output is valid after the reset state is released and the time of 1024 SCKI + 8960/ f_S has elapsed. Because the fade-in operation is performed, it takes additional time of 48/ f_{in} or 48/ f_S until the level corresponding to the analog input signal is obtained. Figure 20 illustrates the clock-halt reset timing.

To avoid ADC performance degradation, BCK (pin 8) and LRCK (pin 7) are required to synchronize with SCKI within 4480/ f_S after SCKI is resumed. If it takes more than 4480/ f_S for BCK and LRCK to synchronize with SCKI, SCKI should be masked until the synchronization is achieved again, taking care of glitch and jitter. See the typical circuit connection diagram, Figure 26.

To avoid ADC performance degradation, the clock-halt reset also should be asserted when system clock SCKI or the audio interface clocks BCK and LRCK (sampling rate f_S) are changed on the fly.

T0081-01

SYMBOL	PARAMETER	MIN	MAX	UNIT
$t_{(CKR)}$	Delay time from SCKI halt to internal reset	4		μs
$t_{(RST)}$	Delay time from SCKI resume to reset release		1024 SCKI	μs
$t_{(REL)}$	Delay time from reset release to DOUT output		8960/ f_S	μs

Figure 20. Clock-Halt Power-Down and Reset Timing

SERIAL AUDIO DATA INTERFACE

The PCM1808 interfaces the audio system through LRCK (pin 7), BCK (pin 8), and DOUT (pin 9).

INTERFACE MODE

The PCM1808 supports master mode and slave mode as interface modes, which are selected by MD1 (pin 11) and MD0 (pin 10), as shown in [Table 2](#). MD1 and MD0 must be set prior to power on.

In master mode, the PCM1808 provides the timing of serial audio data communications between the PCM1808 and the digital audio processor or external circuit. While in slave mode, the PCM1808 receives the timing for data transfer from an external controller.

Table 2. Interface Modes

MD1 (Pin 11)	MD0 (Pin 10)	INTERFACE MODE
Low	Low	Slave mode (256 f _S , 384 f _S , 512 f _S autodetection)
Low	High	Master mode (512 f _S)
High	Low	Master mode (384 f _S)
High	High	Master mode (256 f _S)

Master mode

In master mode, BCK and LRCK work as output pins, and these pins are controlled by timing which is generated in the clock circuit of the PCM1808. The frequency of BCK is fixed at 64 BCK/frame.

Slave mode

In slave mode, BCK and LRCK work as input pins. The PCM1808 accepts 64-BCK/frame or 48-BCK/frame format (only for a 384-f_S system clock), not 32-BCK/frame format.

DATA FORMAT

The PCM1808 supports two audio data formats in both master and slave modes. The data formats are selected by FMT (pin 12), as shown in [Table 3](#). [Figure 21](#) illustrates the data formats in slave mode and master mode.

Table 3. Data Format

FORMAT NO.	FMT (Pin 12)	FORMAT
0	Low	I ² S, 24-bit
1	High	Left-justified, 24-bit

FORMAT 0: FMT = LOW

24-Bit, MSB-First, I²S

FORMAT 1: FMT = HIGH

24-Bit, MSB-First, Left-Justified

T0074-01

SYMBOL	PARAMETER	MIN	TYP	MAX	UNIT
$t_{(SCKBCK)}$	Delay time, SCKI rising edge to BCK edge	5		30	ns

NOTE: Timing measurement reference level is 1.4 V for input and $0.5 V_{DD}$ for output. Load capacitance of BCK is 20 pF. This timing is applied when SCKI frequency is less than 25 MHz.

Figure 24. Audio Clock Interface Timing (Master Mode: BCK Works as Output)

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM

In slave mode, the PCM1808 operates under LRCK (pin 7), synchronized with system clock SCKI (pin 6). The PCM1808 does not require a specific phase relationship between LRCK and SCKI, but does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than ± 6 BCKs for 64 BCK/frame (± 5 BCKs for 48 BCK/frame) during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within $1/f_s$ and digital output is forced to zero data (BPZ code) until resynchronization between LRCK and SCKI is established.

In the case of changes less than ± 5 BCKs for 64 BCK/frame (± 4 BCKs for 48 BCK/frame), resynchronization does not occur and the previously described digital output control and discontinuity do not occur.

Figure 25 illustrates the digital output response for loss of synchronization and resynchronization. During undefined data, the PCM1808 can generate some noise in the audio signal. Also, the transition of normal data to undefined data creates a discontinuity in the digital output data, which can generate some noise in the audio signal. The digital output is valid after resynchronization completes and the time of $32/f_s$ has elapsed. Because the fade-in operation is performed, it takes additional time of $48/f_{in}$ or $48/f_s$ until the level corresponding to the analog input signal is obtained. If synchronization is lost during the fade-in or fade-out operation, the operation stops and DOUT (pin 9) is forced to zero data immediately. The fade-in operation resumes from mute after the time of $32/f_s$ following resynchronization.

T0082-01

Figure 25. ADC Digital Output for Loss of Synchronization and Resynchronization

APPLICATION INFORMATION

TYPICAL CIRCUIT CONNECTION DIAGRAM

Figure 26 is a typical circuit connection diagram. The antialiasing low-pass filters are integrated on the analog inputs, V_{INL} and V_{INR} . If the performance of these filters is not adequate for an application, appropriate external antialiasing filters are needed. A passive RC filter (100 Ω and 0.01 μF to 1 k Ω and 1000 pF) generally is used.

- (1) C1, C2: A 1- μF electrolytic capacitor gives 2.7 Hz ($\tau = 1 \mu\text{F} \times 60 \text{ k}\Omega$) cutoff frequency for the input HPF in normal operation and requires a power-on settling time with a 60-ms time constant in the power-on initialization period.
- (2) C3, C4: Bypass capacitors, 0.1- μF ceramic and 10- μF electrolytic, depending on layout and power supply
- (3) C5: 0.1- μF ceramic and 10- μF electrolytic capacitors are recommended.
- (4) X1: X1 masks the system clock input when using the clock-halt reset function with external control.
- (5) Optional external antialiasing filter could be required, depending on the application.

Figure 26. Typical Circuit Connection Diagram

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC} , V_{DD} PINS

The digital and analog power supply lines to the PCM1808 should be bypassed to the corresponding ground pins with both 0.1- μF ceramic and 10- μF electrolytic capacitors as close to the pins as possible to maximize the dynamic performance of the ADC.

AGND, DGND PINS

To maximize the dynamic performance of the PCM1808, the analog and digital grounds are not internally connected. These grounds should have low impedance to avoid digital noise feedback into the analog ground. They should be connected directly to each other under the PCM1808 package to reduce potential noise problems.

V_{INL} , V_{INR} PINS

V_{INL} and V_{INR} are single-ended inputs. The antialias low-pass filters are integrated on these inputs to remove the high-frequency noise outside the audio band. If the performance of these filters is not adequate for an application, appropriate external antialiasing filters are required. A passive RC filter (100 Ω and 0.01 μF to 1 k Ω and 1000 pF) is generally used.

APPLICATION INFORMATION (continued)**V_{REF} PIN**

To ensure low source impedance of the ADC references, 0.1- μ F ceramic and 10- μ F electrolytic capacitors are recommended between V_{REF} and AGND. These capacitors should be located as close as possible to the V_{REF} pin to reduce dynamic errors on the ADC references.

DOUT PIN

The DOUT pin has a large load-drive capability, but if the DOUT line is long, locating a buffer near the PCM1808 and minimizing load capacitance is recommended to minimize the digital-analog crosstalk and maximize the dynamic performance of the ADC.

SYSTEM CLOCK

The quality of the system clock can influence dynamic performance, as the PCM1808 operates based on a system clock. Therefore, it may be necessary to consider the system clock duty, jitter, and the time difference between system clock transition and BCK or LRCK transition in slave mode.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
PCM1808PW	ACTIVE	TSSOP	PW	14	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM1808PWG4	ACTIVE	TSSOP	PW	14	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM1808PWR	ACTIVE	TSSOP	PW	14	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM1808PWRG4	ACTIVE	TSSOP	PW	14	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

 C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
 D. Falls within JEDEC MO-153

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
