Keep safety first in your circuit designs!

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
   Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corp. product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corp. or a third party.
2. Renesas Technology Corp. assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corp. without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor for the latest product information before purchasing a product listed herein.
   The information described here may contain technical inaccuracies or typographical errors.
   Renesas Technology Corp. assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
   Please also pay attention to information published by Renesas Technology Corp. by various means, including the Renesas Technology Corp. Semiconductor home page (http://www.renesas.com).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corp. assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corp. semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corp. is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
   Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corp. for further details on these materials or the products contained therein.

General Precautions on Handling of Product

1. Treatment of NC Pins

Note: Do not connect anything to the NC pins.
The NC (not connected) pins are either not connected to any of the internal circuitry or are used as test pins or to reduce noise. If something is connected to the NC pins, the operation of the LSI is not guaranteed.

2. Treatment of Unused Input Pins

Note: Fix all unused input pins to high or low level.
Generally, the input pins of CMOS products are high-impedance input pins. If unused pins are in their open states, intermediate levels are induced by noise in the vicinity, a pass-through current flows internally, and a malfunction may occur.

3. Processing before Initialization

Note: When power is first supplied, the product's state is undefined.
The states of internal circuits are undefined until full power is supplied throughout the chip and a low level is input on the reset pin. During the period where the states are undefined, the register settings and the output state of each pin are also undefined. Design your system so that it does not malfunction because of processing while it is in this undefined state. For those products which have a reset function, reset the LSI immediately after the power supply has been turned on.

4. Prohibition of Access to Undefined or Reserved Addresses

Note: Access to undefined or reserved addresses is prohibited.
The undefined or reserved addresses may be used to expand functions, or test registers may have been be allocated to these addresses. Do not access these registers; the system's operation is not guaranteed if they are accessed.

Configuration of This Manual

This manual comprises the following items:

1. General Precautions on Handling of Product
2. Configuration of This Manual
3. Preface
4. Main Revisions for This Edition

   The list of revisions is a summary of points that have been revised or added to earlier versions. This does not include all of the revised contents. For details, see the actual locations in this manual.
5. Contents
6 Overview
7. Description of Functional Modules
   - CPU and System-Control Modules
   - On-Chip Peripheral Modules

   The configuration of the functional description of each module differs according to the module. However, the generic style includes the following items:

   i) Feature
   ii) Input/Output Pin
   iii) Register Description
   iv) Operation
   v) Usage Note

When designing an application system that includes this LSI, take notes into account. Each section includes notes in relation to the descriptions given, and usage notes are given, as required, as the final part of each section.

8. List of Registers
9. Electrical Characteristics
10. Appendix

Preface

The H8/3052BF is a group of high-performance microcontrollers that integrate system supporting functions together with an H8/300H CPU core.

The H8/300H CPU has a 32-bit internal architecture with sixteen 16-bit general registers, and a concise, optimized instruction set designed for speed. It can address a 16-Mbyte linear address space.

The on-chip supporting functions include ROM, RAM, a 16-bit integrated timer unit (ITU), a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), an A/D converter, a D/A converter, I/O ports, a direct memory access controller (DMAC), a refresh controller, and other facilities. Of the two SCI channels, one has been expanded to support the ISO/IEC7816-3 smart card interface. Functions have also been added to reduce power consumption in battery-powered applications: individual modules can be placed in standby, and the frequency of the system clock supplied to the chip can be divided down under software control.

The address space is divided into eight areas. The data bus width and access cycle length can be selected independently in each area, simplifying the connection of different types of memory. Seven operating modes (modes 1 to 7) are provided, offering a choice of data bus width and address space size.

With these features, the H8/3052BF can be used to implement compact, high-performance systems easily.

The H8/3052BF has an F-ZTAT™* version with on-chip flash memory that can be programmed on-board. These versions enable users to respond quickly and flexibly to changing application specifications.

This manual describes the H8/3052BF hardware. For details of the instruction set, refer to the H8/300H Series Software Manual.

Section 1 Overview

1.1 Overview

The H8/3052BF is a group of microcontrollers (MCUs) that integrate system supporting functions together with an H8/300H CPU core having an original Renesas Technology architecture.

The H8/300H CPU has a 32-bit internal architecture with sixteen 16-bit general registers, and a concise, optimized instruction set designed for speed. It can address a 16-Mbyte linear address space. Its instruction set is upward-compatible at the object-code level with the H8/300 CPU, enabling easy porting of software from the H8/300 Series.

The on-chip system supporting functions include ROM, RAM, a 16-bit integrated timer unit (ITU), a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), an A/D converter, a D/A converter, I/O ports, a direct memory access controller (DMAC), a refresh controller, and other facilities.

The H8/3052BF has 512 kbytes of ROM and 8 kbytes of RAM.

Seven MCU operating modes offer a choice of data bus width and address space size. The modes (modes 1 to 7) include one single-chip mode and six expanded modes.

The H8/3052BF has an F-ZTAT™* version with on-chip flash memory that can be programmed on-board.

Table 1.1 summarizes the features of the H8/3052BF.

Note: * F-ZTAT (Flexible–Zero Turn Around Time) is a trademark of Renesas Technology Corp.

Table 1.1 Features

Feature	Description
CPU	Upward-compatible with the H8/300 CPU at the object-code level • General-register machine — Sixteen 16-bit general registers (also usable as + eight 16-bit registers or eight 32-bit registers) • High-speed operation — Maximum clock rate: 25 MHz — Add/subtract: 80 ns — Multiply/divide: 560 ns — 16-Mbyte address space • Instruction features — 8/16/32-bit data transfer, arithmetic, and logic instructions — Signed and unsigned multiply instructions (8 bits × 8 bits, 16 bits × 16 bits) — Signed and unsigned divide instructions (16 bits ÷ 8 bits, 32 bits ÷ 16 bits) — Bit accumulator function — Bit manipulation instructions with register-indirect specification of bit positions
Memory	• Flash memory: 512 kbytes • RAM: 8 kbytes
Interrupt controller	• Seven external interrupt pins: NMI, $\overline{IRQ}_0$ to $\overline{IRQ}_5$ • 30 internal interrupts • Three selectable interrupt priority levels

Feature	Description
Bus controller	• Address space can be partitioned into eight areas, with independent bus specifications in each area • Chip select output available for areas 0 to 7 • 8-bit access or 16-bit access selectable for each area • Two-state or three-state access selectable for each area • Selection of four wait modes • Bus arbitration function
Refresh controller	• DRAM refresh — Directly connectable to 16-bit-wide DRAM — CAS-before-RAS refresh — Self-refresh mode selectable • Pseudo-static RAM refresh — Self-refresh mode selectable • Usable as an interval timer
DMA controller (DMAC)	• Short address mode — Maximum four channels available — Selection of I/O mode, idle mode, or repeat mode — Can be activated by compare match/input capture A interrupts from ITU channels 0 to 3, transmit-data-empty and receive-data-full interrupts from SCI channel 0, or external requests • Full address mode — Maximum two channels available — Selection of normal mode or block transfer mode — Can be activated by compare match/input capture A interrupts from ITU channels 0 to 3, external requests, or auto-request

Feature	Description
16-bit integrated timer unit (ITU)	• Five 16-bit timer channels, capable of processing up to 12 pulse outputs or 10 pulse inputs • 16-bit timer counter (channels 0 to 4) • Two multiplexed output compare/input capture pins (channels 0 to 4) • Operation can be synchronized (channels 0 to 4) • PWM mode available (channels 0 to 4) • Phase counting mode available (channel 2) • Buffering available (channels 3 and 4) • Reset-synchronized PWM mode available (channels 3 and 4) • Complementary PWM mode available (channels 3 and 4) • DMAC can be activated by compare match/input capture A interrupts (channels 0 to 3)
Programmable timing pattern controller (TPC)	• Maximum 16-bit pulse output, using ITU as time base • Up to four 4-bit pulse output groups (or one 16-bit group, or two 8-bit groups) • Non-overlap mode available • Output data can be transferred by DMAC
Watchdog timer (WDT), 1 channel	• Reset signal can be generated by overflow • Usable as an interval timer
Serial communication interface (SCI), 2 channels	• Selection of asynchronous or synchronous mode • Full duplex: can transmit and receive simultaneously • On-chip baud-rate generator • Smart card interface functions added (SCI0 only)
A/D converter	• Resolution: 10 bits • Eight channels, with selection of single or scan mode • Variable analog conversion voltage range • Sample-and-hold function • A/D conversion can be externally triggered

Feature	Description
D/A converter	• Resolution: 8 bits • Two channels • D/A outputs can be sustained in software standby mode
I/O ports	• 70 input/output pins • 9 input-only pins
Operating modes	• Seven MCU operating modes

Mode	Address Space	Address Pins	Initial Bus Width	Max. Bus Width
Mode 1	1 Mbyte	A_{19} to A_0	8 bits	16 bits
Mode 2	1 Mbyte	A_{19} to A_0	16 bits	16 bits
Mode 3	16 Mbytes	A_{23} to A_0	8 bits	16 bits
Mode 4	16 Mbytes	A_{23} to A_0	16 bits	16 bits
Mode 5	1 Mbyte	A_{19} to A_0	8 bits	16 bits
Mode 6	16 Mbytes	A_{23} to A_0	8 bits	16 bits
Mode 7	1 Mbyte	—	—	—

• On-chip ROM is disabled in modes 1 to 4

Power-down state	• Sleep mode • Software standby mode • Hardware standby mode • Module standby function • Programmable system clock frequency division
Other features	• On-chip clock pulse generator

Notes: 1. An external capacitor must be connected when this pin functions as the V_{CL} pin.
2. In modes 1, 3, 5, and 6 the $P4_0$ to $P4_7$ functions of pins $P4_0/D_0$ to $P4_7/D_7$ are selected after a reset, but they can be changed by software.
3. In modes 2 and 4 the D_0 to D_7 functions of pins $P4_0/D_0$ to $P4_7/D_7$ are selected after a reset, but they can be changed by software.

1.3.3 Pin Functions

Table 1.3 summarizes the pin functions.

Table 1.3 Pin Functions

Type	Symbol	Pin No.	I/O	Name and Function
Power	V_{CC}	35, 68	Input	**Power:** For connection to the power supply. Connect all V_{CC} pins to the system power supply.
	V_{SS}	11, 22, 44, 57, 65, 92	Input	**Ground:** For connection to ground (0 V). Connect all V_{SS} pins to the 0-V system power supply.
	V_{CL}	1	Input	Connect an external capacitor between this pin and GND (0 V). Clock	XTAL	67	Input	For connection to a crystal resonator. For examples of crystal resonator and external clock input, see section 19, Clock Pulse Generator.
	EXTAL	66	Input	For connection to a crystal resonator or input of an external clock signal. For examples of crystal resonator and external clock input, see section 19, Clock Pulse Generator.
	ϕ	61	Output	**System clock:** Supplies the system clock to external devices.
Operating mode control	MD_2 to MD_0	75 to 73	Input	**Mode 2 to mode 0:** For setting the operating mode, as follows. Inputs at these pins must not be changed during operation.

MD_2	MD_1	MD_0	Operating Mode
0	0	0	—
0	0	1	Mode 1
0	1	0	Mode 2
0	1	1	Mode 3
1	0	0	Mode 4
1	0	1	Mode 5
1	1	0	Mode 6
1	1	1	Mode 7

Type	Symbol	Pin No.	I/O	Name and Function
System control	$\overline{RES}$	63	Input	**Reset input:** When driven low, this pin resets the chip
	FWE	10	Input	**Flash write enable:** Allows program mode setting.
	$\overline{STBY}$	62	Input	**Standby:** When driven low, this pin forces a transition to hardware standby mode
	$\overline{BREQ}$	59	Input	**Bus request:** Used by an external bus master to request the bus right
	$\overline{BACK}$	60	Output	**Bus request acknowledge:** Indicates that the bus has been granted to an external bus master
Interrupts	NMI	64	Input	**Nonmaskable interrupt:** Requests a nonmaskable interrupt
	$\overline{IRQ_5}$ to $\overline{IRQ_0}$	17, 16, 90 to 87	Input	**Interrupt request 5 to 0:** Maskable interrupt request pins
Address bus	A_{23} to A_0	97 to 100, 56 to 45, 43 to 36	Output	**Address bus:** Outputs address signals
Data bus	D_{15} to D_0	34 to 23, 21 to 18	Input/ output	**Data bus:** Bidirectional data bus
Bus control	$\overline{CS_7}$ to $\overline{CS_0}$	8, 97 to 99, 88 to 91	Output	**Chip select:** Select signals for areas 7 to 0
	$\overline{AS}$	69	Output	**Address strobe:** Goes low to indicate valid address output on the address bus
	$\overline{RD}$	70	Output	**Read:** Goes low to indicate reading from the external address space
	$\overline{HWR}$	71	Output	**High write:** Goes low to indicate writing to the external address space; indicates valid data on the upper data bus (D_{15} to D_8).
	$\overline{LWR}$	72	Output	**Low write:** Goes low to indicate writing to the external address space; indicates valid data on the lower data bus (D_7 to D_0).
	$\overline{WAIT}$	58	Input	**Wait:** Requests insertion of wait states in bus cycles during access to the external address space

Type	Symbol	Pin No.	I/O	Name and Function
Refresh controller	$\overline{RFSH}$	87	Output	**Refresh:** Indicates a refresh cycle
	$\overline{CS_3}$	88	Output	**Row address strobe $\overline{RAS}$:** Row address strobe signal for DRAM connected to area 3
	$\overline{RD}$	70	Output	**Column address strobe $\overline{CAS}$:** Column address strobe signal for DRAM connected to area 3; used with 2$\overline{WE}$ DRAM.
				Write enable $\overline{WE}$: Write enable signal for DRAM connected to area 3; used with 2$\overline{CAS}$ DRAM.
	$\overline{HWR}$	71	Output	**Upper write $\overline{UW}$:** Write enable signal for DRAM connected to area 3; used with 2$\overline{WE}$ DRAM.
				Upper column address strobe $\overline{UCAS}$: Column address strobe signal for DRAM connected to area 3; used with 2$\overline{CAS}$ DRAM.
	$\overline{LWR}$	72	Output	**Lower write $\overline{LW}$:** Write enable signal for DRAM connected to area 3; used with 2$\overline{WE}$ DRAM.
				Lower column address strobe $\overline{LCAS}$: Column address strobe signal for DRAM connected to area 3; used with 2$\overline{CAS}$ DRAM.
DMA controller (DMAC)	$\overline{DREQ_1}$, $\overline{DREQ_0}$	9, 8	Input	**DMA request 1 and 0:** DMAC activation requests
	$\overline{TEND_1}$, $\overline{TEND_0}$	94, 93	Output	**Transfer end 1 and 0:** These signals indicate that the DMAC has ended a data transfer
16-bit integrated timer unit (ITU)	TCLKD to TCLKA	96 to 93	Input	**Clock input D to A:** External clock inputs
	$TIOCA_4$ to $TIOCA_0$	4, 2, 99, 97, 95	Input/ output	**Input capture/output compare A4 to A0:** GRA4 to GRA0 output compare or input capture, or PWM output
	$TIOCB_4$ to $TIOCB_0$	5, 3, 100, 98, 96	Input/ output	**Input capture/output compare B4 to B0:** GRB4 to GRB0 output compare or input capture, or PWM output
	$TOCXA_4$	6	Output	**Output compare XA4:** PWM output
	$TOCXB_4$	7	Output	**Output compare XB4:** PWM output

Type	Symbol	Pin No.	I/O	Name and Function
Programmable timing pattern controller (TPC)	TP_{15} to TP_0	9 to 2, 100 to 93	Output	**TPC output 15 to 0:** Pulse output
Serial communication interface (SCI)	TxD_1, TxD_0	13, 12	Output	**Transmit data (channels 0 and 1):** SCI data output
	RxD_1, RxD_0	15, 14	Input	**Receive data (channels 0 and 1):** SCI data input
	SCK_1, SCK_0	17, 16	Input/ output	**Serial clock (channels 0 and 1):** SCI clock input/output
A/D converter	AN_7 to AN_0	85 to 78	Input	**Analog 7 to 0:** Analog input pins
	$\overline{ADTRG}$	9	Input	**A/D trigger:** External trigger input for starting A/D conversion
D/A converter	DA_1, DA_0	85, 84	Output	**Analog output:** Analog output from the D/A converter
A/D and D/A converters	AV_{CC}	76	Input	Power supply pin for the A/D and D/A converters. Connect to the system power supply (+5 V) when not using the A/D and D/A converters.
	AV_{SS}	86	Input	Ground pin for the A/D and D/A converters. Connect to system ground (0 V).
	V_{REF}	77	Input	Reference voltage input pin for the A/D and D/A converters. Connect to the system power supply (+5 V) when not using the A/D and D/A converters.
I/O ports	$P1_7$ to $P1_0$	43 to 36	Input/ output	**Port 1:** Eight input/output pins. The direction of each pin can be selected in the port 1 data direction register (P1DDR).
	$P2_7$ to $P2_0$	52 to 45	Input/ output	**Port 2:** Eight input/output pins. The direction of each pin can be selected in the port 2 data direction register (P2DDR).
	$P3_7$ to $P3_0$	34 to 27	Input/ output	**Port 3:** Eight input/output pins. The direction of each pin can be selected in the port 3 data direction register (P3DDR).
	$P4_7$ to $P4_0$	26 to 23, 21 to 18	Input/ output	**Port 4:** Eight input/output pins. The direction of each pin can be selected in the port 4 data direction register (P4DDR).

Type	Symbol	Pin No.	I/O	Name and Function
I/O ports	$P5_3$ to $P5_0$	56 to 53	Input/ output	**Port 5:** Four input/output pins. The direction of each pin can be selected in the port 5 data direction register (P5DDR).
	$P6_6$ to $P6_0$	72 to 69, 60 to 58	Input/ output	**Port 6:** Seven input/output pins. The direction of each pin can be selected in the port 6 data direction register (P6DDR).
	$P7_7$ to $P7_0$	85 to 78	Input	**Port 7:** Eight input pins
	$P8_4$ to $P8_0$	91 to 87	Input/ output	**Port 8:** Five input/output pins. The direction of each pin can be selected in the port 8 data direction register (P8DDR).
	$P9_5$ to $P9_0$	17 to 12	Input/ output	**Port 9:** Six input/output pins. The direction of each pin can be selected in the port 9 data direction register (P9DDR).
	PA_7 to PA_0	100 to 93	Input/ output	**Port A:** Eight input/output pins. The direction of each pin can be selected in the port A data direction register (PADDR).
	PB_7 to PB_0	9 to 2	Input/ output	**Port B:** Eight input/output pins. The direction of each pin can be selected in the port B data direction register (PBDDR).

Section 2 CPU

2.1 Overview

The H8/300H CPU is a high-speed central processing unit with an internal 32-bit architecture that is upward-compatible with the H8/300 CPU. The H8/300H CPU has sixteen 16-bit general registers, can address a 16-Mbyte linear address space, and is ideal for realtime control.

2.1.1 Features

The H8/300H CPU has the following features.

- Upward compatibility with H8/300 CPU
  Can execute H8/300 Series object programs
- General-register architecture
  Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)
- Sixty-two basic instructions
  - 8/16/32-bit data transfer and arithmetic and logic instructions
  - Multiply and divide instructions
  - Powerful bit-manipulation instructions
- Eight addressing modes
  - Register direct [Rn]
  - Register indirect [@ERn]
  - Register indirect with displacement [@(d:16, ERn) or @(d:24, ERn)]
  - Register indirect with post-increment or pre-decrement [@ERn+ or @–ERn]
  - Absolute address [@aa:8, @aa:16, or @aa:24]
  - Immediate [#xx:8, #xx:16, or #xx:32]
  - Program-counter relative [@(d:8, PC) or @(d:16, PC)]
  - Memory indirect [@@aa:8]
- 16-Mbyte linear address space
- High-speed operation
  - All frequently-used instructions execute in two to four states
  - Maximum clock frequency: 25 MHz
  - 8/16/32-bit register-register add/subtract: 80 ns
  - 8 × 8-bit register-register multiply: 560 ns
  - 16 ÷ 8-bit register-register divide: 560 ns

— 16 × 16-bit register-register multiply: 0.88 µs
— 32 ÷ 16-bit register-register divide: 0.88 µs

- Two CPU operating modes
  — Normal mode (not available in the H8/3052BF)
  — Advanced mode
- Low-power mode
  Transition to power-down state by SLEEP instruction

2.1.2 Differences from H8/300 CPU

In comparison to the H8/300 CPU, the H8/300H has the following enhancements.

- More general registers
  Eight 16-bit registers have been added.
- Expanded address space
  — Advanced mode supports a maximum 16-Mbyte address space.
  — Normal mode supports the same 64-kbyte address space as the H8/300 CPU.
  (Normal mode is not available in the H8/3052BF.)
- Enhanced addressing
  The addressing modes have been enhanced to make effective use of the 16-Mbyte address space.
- Enhanced instructions
  — Data transfer, arithmetic, and logic instructions can operate on 32-bit data.
  — Signed multiply/divide instructions and other instructions have been added.

2.2 CPU Operating Modes

The H8/300H CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-kbyte address space. Advanced mode supports up to 16 Mbytes.

The H8/3052BF can be used only in advanced mode. (Information from this point on will apply to advanced mode unless otherwise stated.)

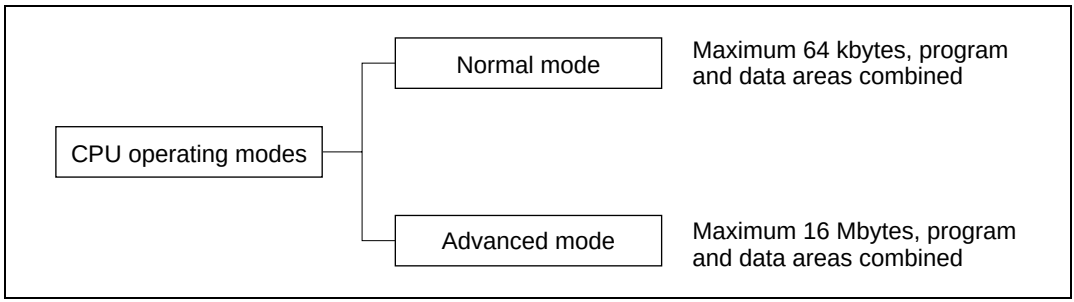

Figure 2.1 CPU Operating Modes

2.3 Address Space

The maximum address space of the H8/300H CPU is 16 Mbytes. The H8/3052BF has various operating modes (MCU modes), some providing a 1-Mbyte address space, the others supporting the full 16 Mbytes.

Figure 2.2 shows the address ranges of the H8/3052BF. For further details see section 3.6, Memory Map in Each Operating Mode.

The 1-Mbyte operating modes use 20-bit addressing. The upper 4 bits of effective addresses are ignored.

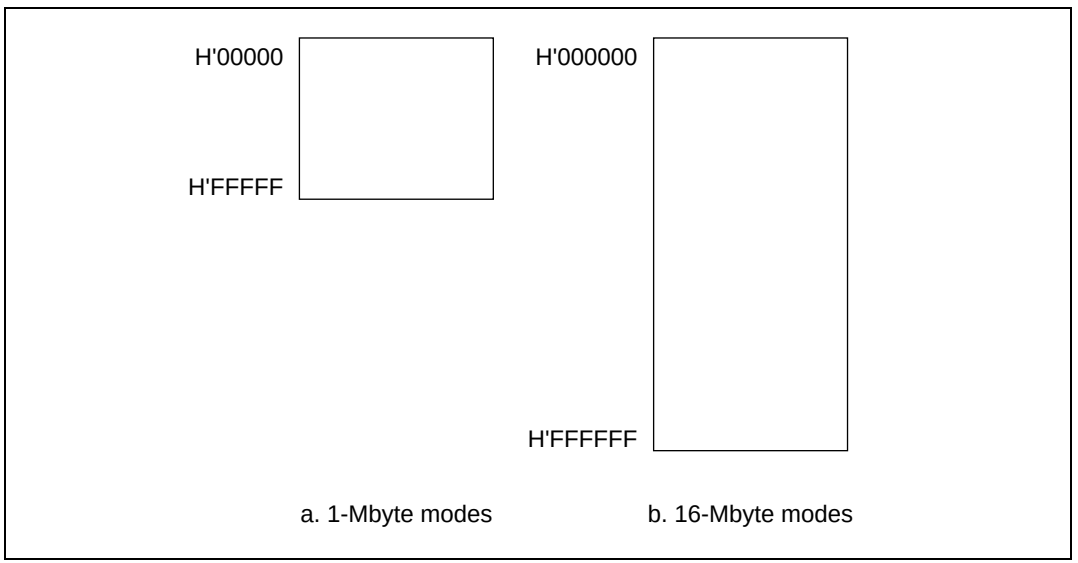

Figure 2.2 Memory Map

2.4 Register Configuration

2.4.1 Overview

The H8/300H CPU has the internal registers shown in figure 2.3. There are two types of registers: general registers and control registers.

General Registers (ERn)

	15 0	7 0	7 0
ER0	E0	R0H	R0L
ER1	E1	R1H	R1L
ER2	E2	R2H	R2L
ER3	E3	R3H	R3L
ER4	E4	R4H	R4L
ER5	E5	R5H	R5L
ER6	E6	R6H	R6L
ER7	E7 (SP)	R7H	R7L

Control Registers (CR)

	23 0
PC	

	7	6	5	4	3	2	1	0
CCR	I	UI	H	U	N	Z	V	C

Legend:
SP: Stack pointer
PC: Program counter
CCR: Condition code register
I: Interrupt mask bit
UI: User bit or interrupt mask bit
H: Half-carry flag
U: User bit
N: Negative flag
Z: Zero flag
V: Overflow flag
C: Carry flag

Figure 2.3 CPU Internal Registers

2.4.2 General Registers

The H8/300H CPU has eight 32-bit general registers. These general registers are all functionally alike and can be used without distinction between data registers and address registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. When the general registers are used as 32-bit registers or as address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit general registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8-bit registers.

Figure 2.4 illustrates the usage of the general registers. The usage of each register can be selected independently.

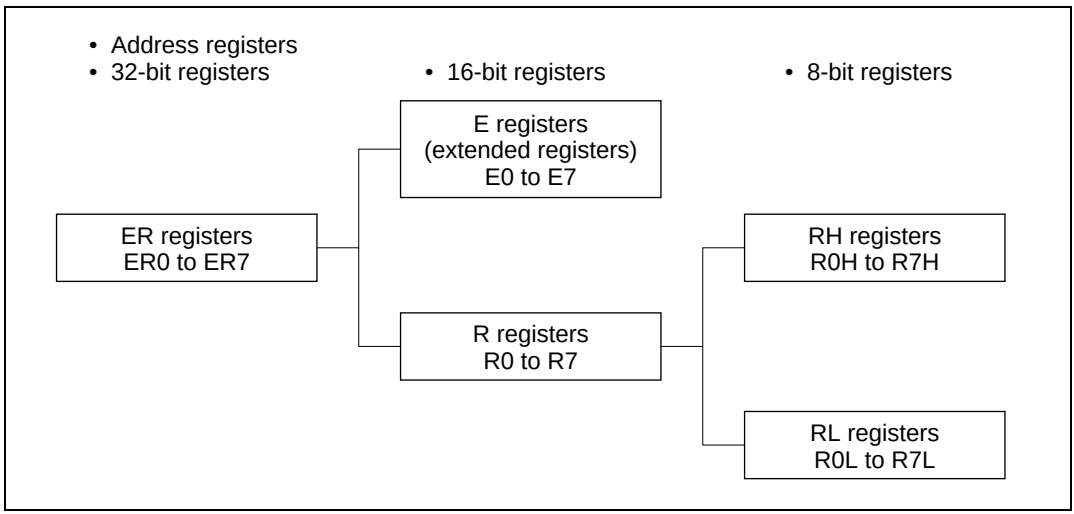

Figure 2.4 Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.5 shows the stack.

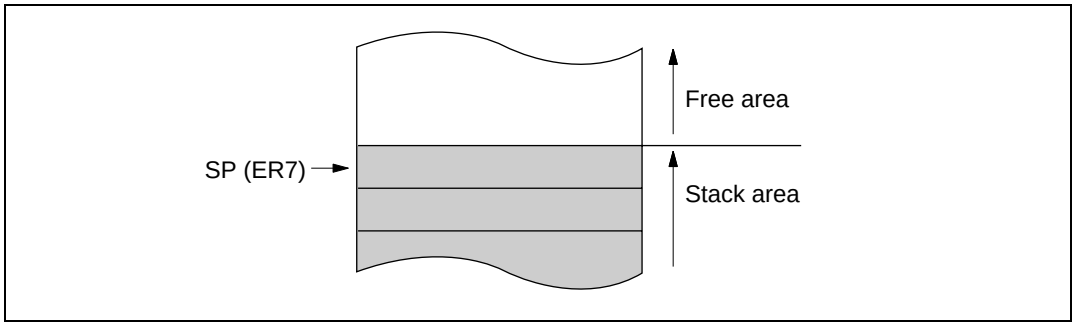

Figure 2.5 Stack

2.4.3 Control Registers

The control registers are the 24-bit program counter (PC) and the 8-bit condition code register (CCR).

Program Counter (PC): This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word) or a multiple of 2 bytes, so the least significant PC bit is ignored. When an instruction is fetched, the least significant PC bit is regarded as 0.

Condition Code Register (CCR): This 8-bit register contains internal CPU status information, including the interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags.

- Bit 7—Interrupt Mask Bit (I)

  Masks interrupts other than NMI when set to 1. NMI is accepted regardless of the I bit setting. The I bit is set to 1 at the start of an exception-handling sequence.
- Bit 6—User Bit or Interrupt Mask Bit (UI)

  Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit can also be used as an interrupt mask bit. For details see section 5, Interrupt Controller.
- Bit 5—Half-Carry Flag (H)

  When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a

carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.

- Bit 4—User Bit (U)

  Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.
- Bit 3—Negative Flag (N)

  Indicates the most significant bit (sign bit) of data.
- Bit 2—Zero Flag (Z)

  Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.
- Bit 1—Overflow Flag (V)

  Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times.
- Bit 0—Carry Flag (C)

  Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by:

  — Add instructions, to indicate a carry

  — Subtract instructions, to indicate a borrow

  — Shift and rotate instructions, to store the value shifted out of the end bit

  The carry flag is also used as a bit accumulator by bit manipulation instructions.

Some instructions leave flag bits unchanged. Operations can be performed on CCR by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used by conditional branch (Bcc) instructions.

For the action of each instruction on the flag bits, see appendix A.1, Instruction List. For the I and UI bits, see section 5, Interrupt Controller.

2.4.4 Initial CPU Register Values

In reset exception handling, PC is initialized to a value loaded from the vector table, and the I bit in CCR is set to 1. The other CCR bits and the general registers are not initialized. The initial value of the stack pointer (ER7) is undefined. The stack pointer must therefore be initialized by an MOV.L instruction executed immediately after a reset.

2.5 Data Formats

The H8/300H CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit n (n = 0, 1, 2, …, 7) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

2.5.1 General Register Data Formats

Figure 2.6 shows the data formats in general registers.

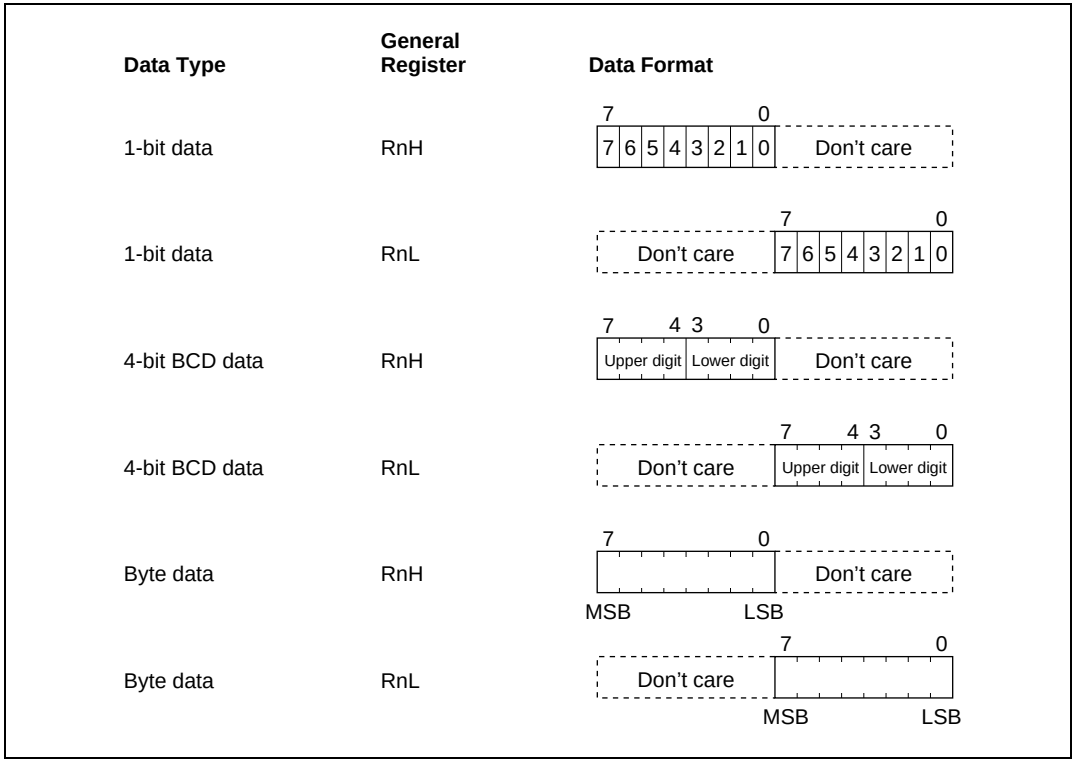

Figure 2.6 General Register Data Formats (1)

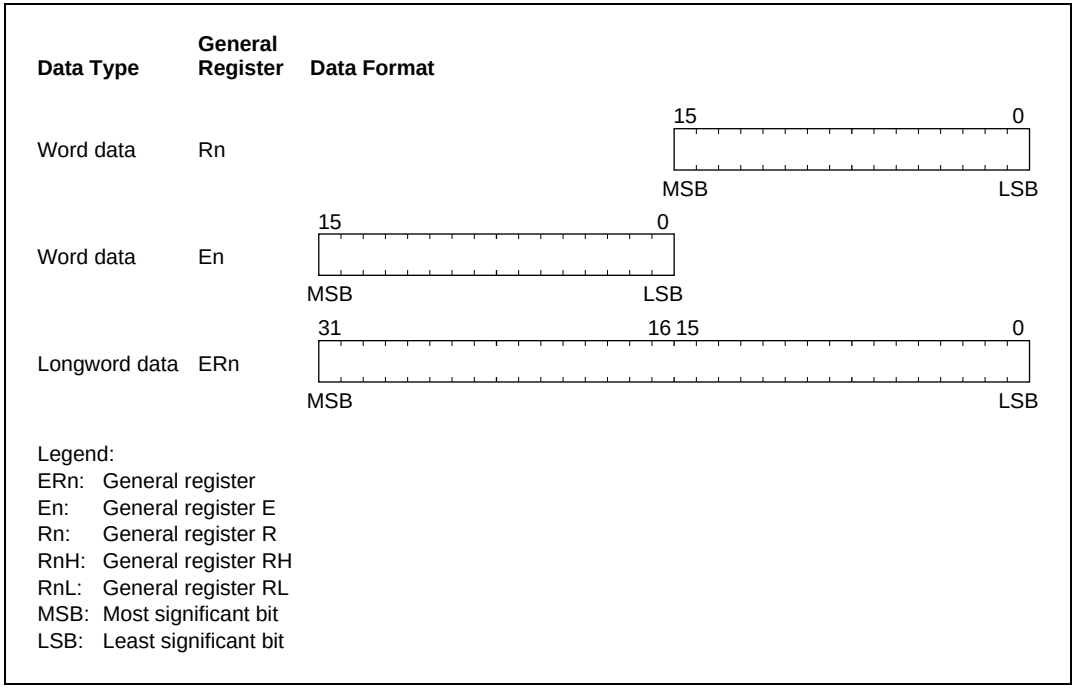

Figure 2.6 General Register Data Formats (2)

2.5.2 Memory Data Formats

Figure 2.7 shows the data formats on memory. The H8/300H CPU can access word data and longword data on memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0, so the access starts at the preceding address. This also applies to instruction fetches.

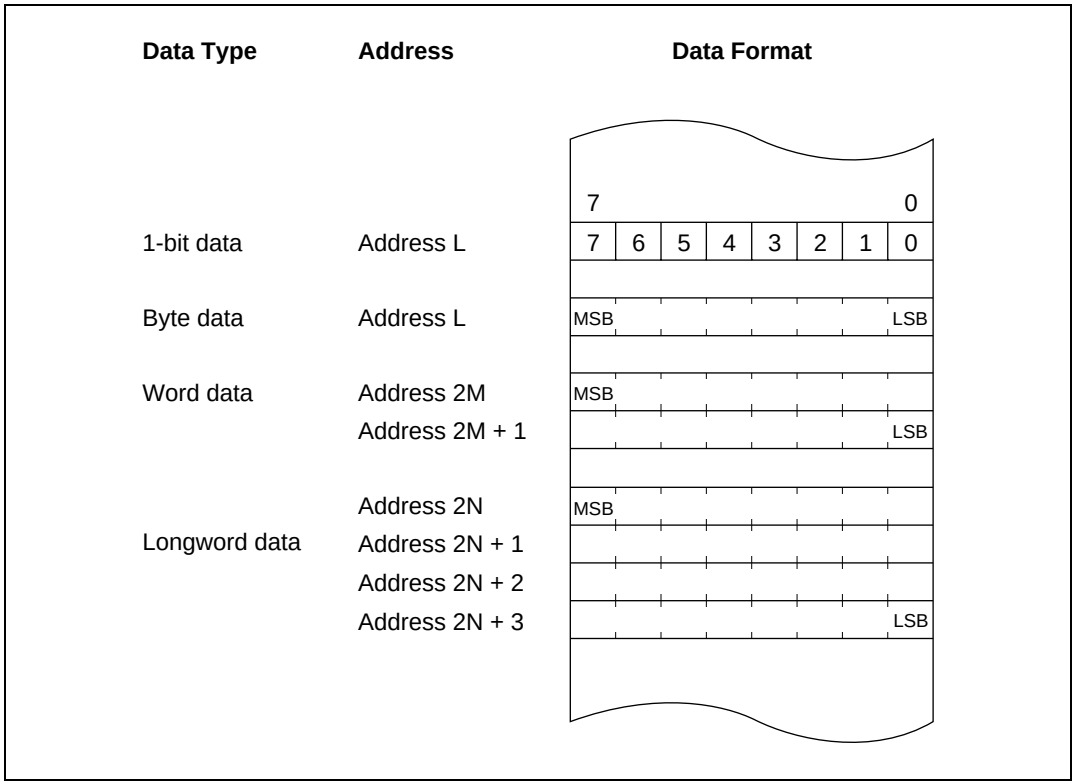

Figure 2.7 Memory Data Formats

When ER7 (SP) is used as an address register to access the stack, the operand size should be word size or longword size.

2.6 Instruction Set

2.6.1 Instruction Set Overview

The H8/300H CPU has 62 types of instructions, which are classified in table 2.1.

Table 2.1 Instruction Classification

Function	Instruction	Types
Data transfer	MOV, PUSH*1, POP*1, MOVTPE*2, MOVFPE*2	3
Arithmetic operations	ADD, SUB, ADDX, SUBX, INC, DEC, ADDS, SUBS, DAA, DAS, MULXU, MULXS, DIVXU, DIVXS, CMP, NEG, EXTS, EXTU	18
Logic operations	AND, OR, XOR, NOT	4
Shift operations	SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR	8
Bit manipulation	BSET, BCLR, BNOT, BTST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR, BLD, BILD, BST, BIST	14
Branch	Bcc*3, JMP, BSR, JSR, RTS	5
System control	TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP	9
Block data transfer	EEPMOV	1
	Total	62 types

Notes: 1. POP.W Rn is identical to MOV.W @SP+, Rn.
PUSH.W Rn is identical to MOV.W Rn, @–SP.
POP.L ERn is identical to MOV.L @SP+, Rn.
PUSH.L ERn is identical to MOV.L Rn, @–SP.
2. Not available in the H8/3052BF.
3. Bcc is a generic branching instruction.

2.6.2 Instructions and Addressing Modes

Table 2.2 indicates the instructions available in the H8/300H CPU.

Table 2.2 Instructions and Addressing Modes

2.6.3 Tables of Instructions Classified by Function

Tables 2.3 to 2.10 summarize the instructions in each functional category. The operation notation used in these tables is defined next.

Operation Notation

Rd	General register (destination)*
Rs	General register (source)*
Rn	General register*
ERn	General register (32-bit register or address register)
(EAd)	Destination operand
(EAs)	Source operand
CCR	Condition code register
N	N (negative) flag of CCR
Z	Z (zero) flag of CCR
V	V (overflow) flag of CCR
C	C (carry) flag of CCR
PC	Program counter
SP	Stack pointer
#IMM	Immediate data
disp	Displacement
+	Addition
–	Subtraction
×	Multiplication
÷	Division
∧	AND logical
∨	OR logical
⊕	Exclusive OR logical
→	Move
¬	NOT (logical complement)
:3/:8/:16/:24	3-, 8-, 16-, or 24-bit length

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit data or address registers (ER0 to ER7).

Table 2.3 Data Transfer Instructions

Instruction	Size*	Function
MOV	B/W/L	(EAs) → Rd, Rs → (EAd) Moves data between two general registers or between a general register and memory, or moves immediate data to a general register.
MOVFPE	B	(EAs) → Rd Cannot be used in the H8/3052BF.
MOVTPE	B	Rs → (EAs) Cannot be used in the H8/3052BF.
POP	W/L	@SP+ → Rn Pops a general register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. Similarly, POP.L ERn is identical to MOV.L @SP+, ERn.
PUSH	W/L	Rn → @–SP Pushes a general register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @–SP. Similarly, PUSH.L ERn is identical to MOV.L ERn, @–SP.

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

Table 2.4 Arithmetic Operation Instructions

Instruction	Size*	Function
ADD, SUB	B/W/L	Rd ± Rs → Rd, Rd ± #IMM → Rd Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from data in a general register. Use the SUBX or ADD instruction.)
ADDX, SUBX	B	Rd ± Rs ± C → Rd, Rd ± #IMM ± C → Rd Performs addition or subtraction with carry or borrow on data in two general registers, or on immediate data and data in a general register.
INC, DEC	B/W/L	Rd ± 1 → Rd, Rd ± 2 → Rd Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.)
ADDS, SUBS	L	Rd ± 1 → Rd, Rd ± 2 → Rd, Rd ± 4 → Rd Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register.
DAA, DAS	B	Rd decimal adjust → Rd Decimal-adjusts an addition or subtraction result in a general register by referring to CCR to produce 4-bit BCD data.
MULXU	B/W	Rd × Rs → Rd Performs unsigned multiplication on data in two general registers: either 8 bits × 8 bits → 16 bits or 16 bits × 16 bits → 32 bits.
MULXS	B/W	Rd × Rs → Rd Performs signed multiplication on data in two general registers: either 8 bits × 8 bits → 16 bits or 16 bits × 16 bits → 32 bits.

Instruction	Size*	Function
DIVXU	B/W	Rd ÷ Rs → Rd Performs unsigned division on data in two general registers: either 16 bits ÷ 8 bits → 8-bit quotient and 8-bit remainder or 32 bits ÷ 16 bits → 16-bit quotient and 16-bit remainder.
DIVXS	B/W	Rd ÷ Rs → Rd Performs signed division on data in two general registers: either 16 bits ÷ 8 bits → 8-bit quotient and 8-bit remainder, or 32 bits ÷ 16 bits → 16-bit quotient and 16-bit remainder.
CMP	B/W/L	Rd – Rs, Rd – #IMM Compares data in a general register with data in another general register or with immediate data, and sets CCR according to the result.
NEG	B/W/L	0 – Rd → Rd Takes the two's complement (arithmetic complement) of data in a general register.
EXTS	W/L	Rd (sign extension) → Rd Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by extending the sign bit.
EXTU	W/L	Rd (zero extension) → Rd Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by padding with zeros.

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

Table 2.5 Logic Operation Instructions

Instruction	Size*	Function
AND	B/W/L	Rd ∧ Rs → Rd, Rd ∧ #IMM → Rd Performs a logical AND operation on a general register and another general register or immediate data.
OR	B/W/L	Rd ∨ Rs → Rd, Rd ∨ #IMM → Rd Performs a logical OR operation on a general register and another general register or immediate data.
XOR	B/W/L	Rd ⊕ Rs → Rd, Rd ⊕ #IMM → Rd Performs a logical exclusive OR operation on a general register and another general register or immediate data.
NOT	B/W/L	¬ Rd → Rd Takes the one's complement of general register contents.

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

Table 2.6 Shift Instructions

Instruction	Size*	Function
SHAL, SHAR	B/W/L	Rd (shift) → Rd Performs an arithmetic shift on general register contents.
SHLL, SHLR	B/W/L	Rd (shift) → Rd Performs a logical shift on general register contents.
ROTL, ROTR	B/W/L	Rd (rotate) → Rd Rotates general register contents.
ROTXL, ROTXR	B/W/L	Rd (rotate) → Rd Rotates general register contents through the carry bit.

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

Table 2.7 Bit Manipulation Instructions

Instruction	Size*	Function
BSET	B	1 → (<bit-No.> of <EAd>) Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BCLR	B	0 → (<bit-No.> of <EAd>) Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BNOT	B	¬ (<bit-No.> of <EAd>) → (<bit-No.> of <EAd>) Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BTST	B	¬ (<bit-No.> of <EAd>) → Z Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BAND	B	C ∧ (<bit-No.> of <EAd>) → C ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIAND	B	C ∧ [¬ (<bit-No.> of <EAd>)] → C ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.

Instruction	Size*	Function
BOR	B	C ∨ (<bit-No.> of <EAd>) → C ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIOR	B	C ∨ [¬ (<bit-No.> of <EAd>)] → C ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BXOR	B	C ⊕ (<bit-No.> of <EAd>) → C Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIXOR	B	C ⊕ [¬ (<bit-No.> of <EAd>)] → C Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.
BLD	B	(<bit-No.> of <EAd>) → C Transfers a specified bit in a general register or memory operand to the carry flag.
BILD	B	¬ (<bit-No.> of <EAd>) → C Transfers the inverse of a specified bit in a general register or memory operand to the carry flag. The bit number is specified by 3-bit immediate data.
BST	B	C → (<bit-No.> of <EAd>) Transfers the carry flag value to a specified bit in a general register or memory operand.
BIST	B	C → ¬ (<bit-No.> of <EAd>) Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data.

Note: * Size refers to the operand size.
B: Byte

Table 2.8 Branching Instructions

Instruction	Size	Function
Bcc	—	Branches to a specified address if a specified condition is true. The branching conditions are listed below.

Mnemonic	Description	Condition
BRA (BT)	Always (true)	Always
BRN (BF)	Never (false)	Never
BHI	High	C ∨ Z = 0
BLS	Low or same	C ∨ Z = 1
Bcc (BHS)	Carry clear (high or same)	C = 0
BCS (BLO)	Carry set (low)	C = 1
BNE	Not equal	Z = 0
BEQ	Equal	Z = 1
BVC	Overflow clear	V = 0
BVS	Overflow set	V = 1
BPL	Plus	N = 0
BMI	Minus	N = 1
BGE	Greater or equal	N ⊕ V = 0
BLT	Less than	N ⊕ V = 1
BGT	Greater than	Z ∨ (N ⊕ V) = 0
BLE	Less or equal	Z ∨ (N ⊕ V) = 1

JMP	—	Branches unconditionally to a specified address
BSR	—	Branches to a subroutine at a specified address
JSR	—	Branches to a subroutine at a specified address
RTS	—	Returns from a subroutine

Table 2.9 System Control Instructions

Instruction	Size*	Function
TRAPA	—	Starts trap-instruction exception handling
RTE	—	Returns from an exception-handling routine
SLEEP	—	Causes a transition to the power-down state
LDC	B/W	(EAs) → CCR Moves the source operand contents to the condition code register. The condition code register size is one byte, but in transfer from memory, data is read by word access.
STC	B/W	CCR → (EAd) Transfers the CCR contents to a destination location. The condition code register size is one byte, but in transfer to memory, data is written by word access.
ANDC	B	CCR ∧ #IMM → CCR Logically ANDs the condition code register with immediate data.
ORC	B	CCR ∨ #IMM → CCR Logically ORs the condition code register with immediate data.
XORC	B	CCR ⊕ #IMM → CCR Logically exclusive-ORs the condition code register with immediate data.
NOP	—	PC + 2 → PC Only increments the program counter.

Note: * Size refers to the operand size.
B: Byte
W: Word

Table 2.10 Block Transfer Instruction

Instruction	Size	Function
EEPMOV.B	—	if R4L ≠ 0 then repeat @ER5+ → @ER6+, R4L – 1 → R4L until R4L = 0 else next;
EEPMOV.W	—	if R4 ≠ 0 then repeat @ER5+ → @ER6+, R4 – 1 → R4 until R4 = 0 else next;
		Transfers a data block according to parameters set in general registers R4L or R4, ER5, and ER6. R4L or R4: Size of block (bytes) ER5: Starting source address ER6: Starting destination address Execution of the next instruction begins as soon as the transfer is completed.

2.6.4 Basic Instruction Formats

The H8/300H instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (OP field), a register field (r field), an effective address extension (EA field), and a condition field (cc).

Operation Field: Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first 4 bits of the instruction. Some instructions have two operation fields.

Register Field: Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.

Effective Address Extension: Eight, 16, or 32 bits specifying immediate data, an absolute address, or a displacement. A 24-bit address or displacement is treated as 32-bit data in which the first 8 bits are 0 (H'00).

Condition Field: Specifies the branching condition of Bcc instructions.

Figure 2.8 shows examples of instruction formats.

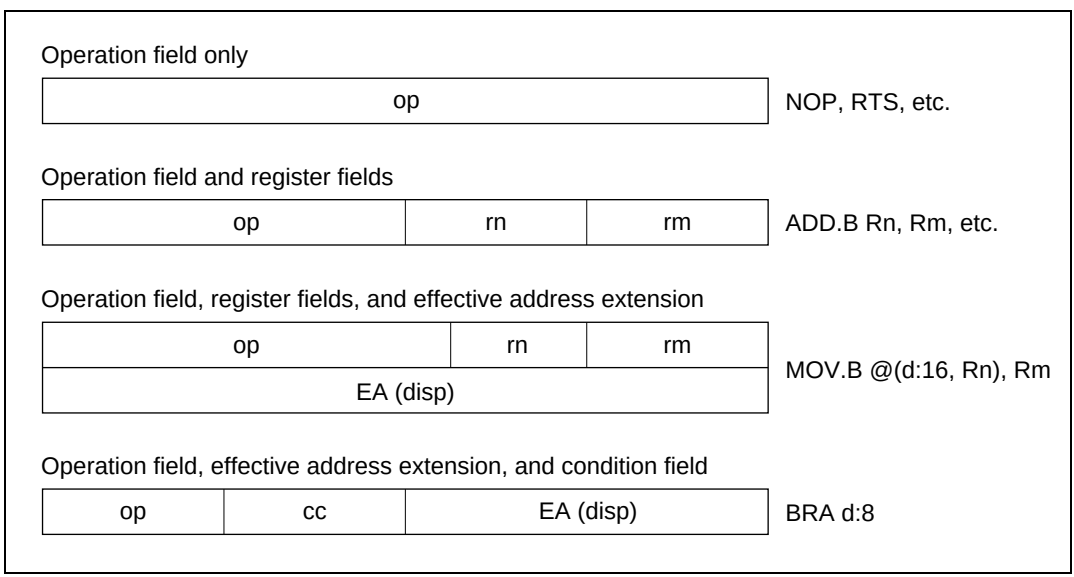

Figure 2.8 Instruction Formats

2.6.5 Notes on Use of Bit Manipulation Instructions

The BSET, BCLR, BNOT, BST, and BIST instructions read a byte of data, modify a bit in the byte, then write the byte back. Care is required when these instructions are used to access registers with write-only bits, or to access ports.

The BCLR instruction can be used to clear flags in the on-chip registers. In an interrupt-handling routine, for example, if it is known that the flag is set to 1, it is not necessary to read the flag ahead of time.

Step		Description
1	Read	Read data (byte unit) at the specified address
2	Bit manipulation	Modify the specified bit in the read data
3	Write	Write the modified data (byte unit) to the specified address

In the following example, a BCLR instruction is executed on the data direction register (DDR) of port 4.

$P4_7$ and $P4_6$ are set as input pins, and are inputting low-level and high-level signals, respectively.

$P4_5$ to $P4_0$ are set as output pins, and are in the low-level output state.

In this example, the BCLR instruction is used to make $P4_0$ an input port.

Before Execution of BCLR Instruction

	$P4_7$	$P4_6$	$P4_5$	$P4_4$	$P4_3$	$P4_2$	$P4_1$	$P4_0$
Input/output	Input	Input	Output	Output	Output	Output	Output	Output
DDR	0	0	1	1	1	1	1	1
DR	1	0	0	0	0	0	0	0

Execution of BCLR Instruction

```
BCLR  #0, @P4DDR        ; Execute BCLR instruction on DDR
```

After Execution of BCLR Instruction

	$P4_7$	$P4_6$	$P4_5$	$P4_4$	$P4_3$	$P4_2$	$P4_1$	$P4_0$
Input/output	Output	Output	Output	Output	Output	Output	Output	Input
DDR	1	1	1	1	1	1	1	0
DR	1	0	0	0	0	0	0	0

Explanation of BCLR Instruction

To execute the BCLR instruction, the CPU begins by reading P4DDR. Since P4DDR is a write-only register, it is read as H'FF, even though its true value is H'3F.

Next the CPU clears bit 0 of the read data, changing the value to H'FE.

Finally, the CPU writes this value (H'FE) back to DDR to complete the BCLR instruction.

As a result, $P4_0$DDR is cleared to 0, making $P4_0$ an input pin. In addition, $P4_7$DDR and $P4_6$DDR are set to 1, making $P4_7$ and $P4_6$ output pins.

The BCLR instruction can be used to clear flags in the internal I/O registers to 0. In an interrupt-handling routine, for example, if it is known that the flag is set to 1, it is not necessary to read the flag ahead of time.

2.7 Addressing Modes and Effective Address Calculation

2.7.1 Addressing Modes

The H8/300H CPU supports the eight addressing modes listed in table 2.11. Each instruction uses a subset of these addressing modes. Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute (@aa:8) addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 2.11 Addressing Modes

No.	Addressing Mode	Symbol
1	Register direct	Rn
2	Register indirect	@ERn
3	Register indirect with displacement	@(d:16, ERn)/@(d:24, ERn)
4	Register indirect with post-increment	@ERn+
	Register indirect with pre-decrement	@–ERn
5	Absolute address	@aa:8/@aa:16/@aa:24
6	Immediate	#xx:8/#xx:16/#xx:32
7	Program-counter relative	@(d:8, PC)/@(d:16, PC)
8	Memory indirect	@@aa:8

Register Direct—Rn: The register field of the instruction code specifies an 8-, 16-, or 32-bit register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

Register Indirect—@ERn: The register field of the instruction code specifies an address register (ERn), the lower 24 bits of which contain the address of the operand.

Register Indirect with Displacement—@(d:16, ERn) or @(d:24, ERn): A 16-bit or 24-bit displacement contained in the instruction code is added to the contents of an address register (ERn) specified by the register field of the instruction, and the lower 24 bits of the sum specify the address of a memory operand. A 16-bit displacement is sign-extended when added.

Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @–ERn:

- Register indirect with post-increment—@ERn+

  The register field of the instruction code specifies an address register (ERn) the lower 24 bits of which contain the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents (32 bits) and the sum is stored in the address register. The value added is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the register value should be even.
- Register indirect with pre-decrement—@–ERn

  The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the lower 24 bits of the result become the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the resulting register value should be even.

Absolute Address—@aa:8, @aa:16, or @aa:24: The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), or 24 bits long (@aa:24). For an 8-bit absolute address, the upper 16 bits are all assumed to be 1 (H'FFFF). For a 16-bit absolute address the upper 8 bits are a sign extension. A 24-bit absolute address can access the entire address space. Table 2.12 indicates the accessible address ranges.

Table 2.12 Absolute Address Access Ranges

Absolute Address	1-Mbyte Modes	16-Mbyte Modes
8 bits (@aa:8)	H'FFF00 to H'FFFFF (1048320 to 1048575)	H'FFFF00 to H'FFFFFF (16776960 to 16777215)
16 bits (@aa:16)	H'00000 to H'07FFF, H'F8000 to H'FFFFF (0 to 32767, 1015808 to 1048575)	H'000000 to H'007FFF, H'FF8000 to H'FFFFFF (0 to 32767, 16744448 to 16777215)
24 bits (@aa:24)	H'00000 to H'FFFFF (0 to 1048575)	H'000000 to H'FFFFFF (0 to 16777215)

Immediate—#xx:8, #xx:16, or #xx:32: The instruction code contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The instruction codes of the ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. The instruction codes of some bit manipulation instructions contain 3-bit immediate data specifying a bit number. The TRAPA instruction code contains 2-bit immediate data specifying a vector address.

Program-Counter Relative—@(d:8, PC) or @(d:16, PC): This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction code is sign-extended to 24 bits and added to the 24-bit PC contents to generate a 24-bit branch address. The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is –126 to +128 bytes (–63 to +64 words) or –32766 to +32768 bytes (–16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

Memory Indirect—@@aa:8: This mode can be used by the JMP and JSR instructions. The instruction code contains an 8-bit absolute address specifying a memory operand. This memory operand contains a branch address. The memory operand is accessed by longword access. The first byte of the memory operand is ignored, generating a 24-bit branch address. See figure 2.9. The upper bits of the 8-bit absolute address are assumed to be 0 (H'0000), so the address range is 0 to 255 (H'000000 to H'0000FF). Note that the first part of this range is also the exception vector area. For further details see section 5, Interrupt Controller.

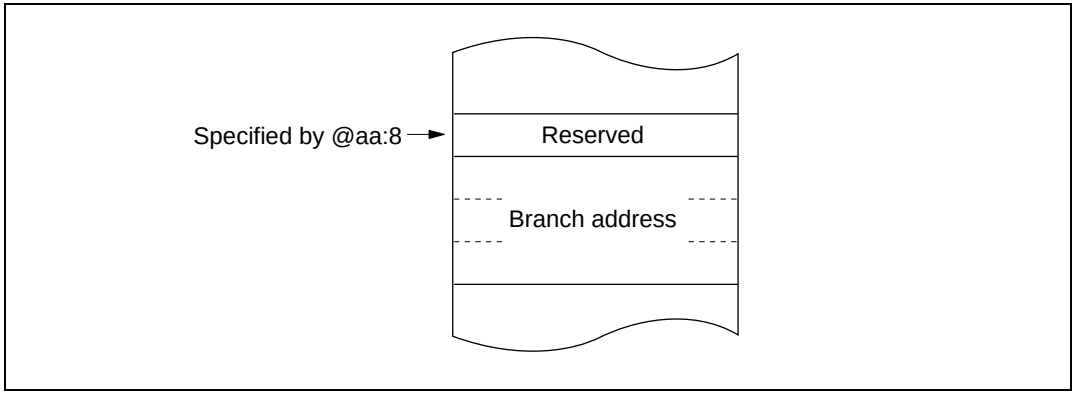

Figure 2.9 Memory-Indirect Branch Address Specification

When a word-size or longword-size memory operand is specified, or when a branch address is specified, if the specified memory address is odd, the least significant bit is regarded as 0. The accessed data or instruction code therefore begins at the preceding address. See section 2.5.2, Memory Data Formats.

2.7.2 Effective Address Calculation

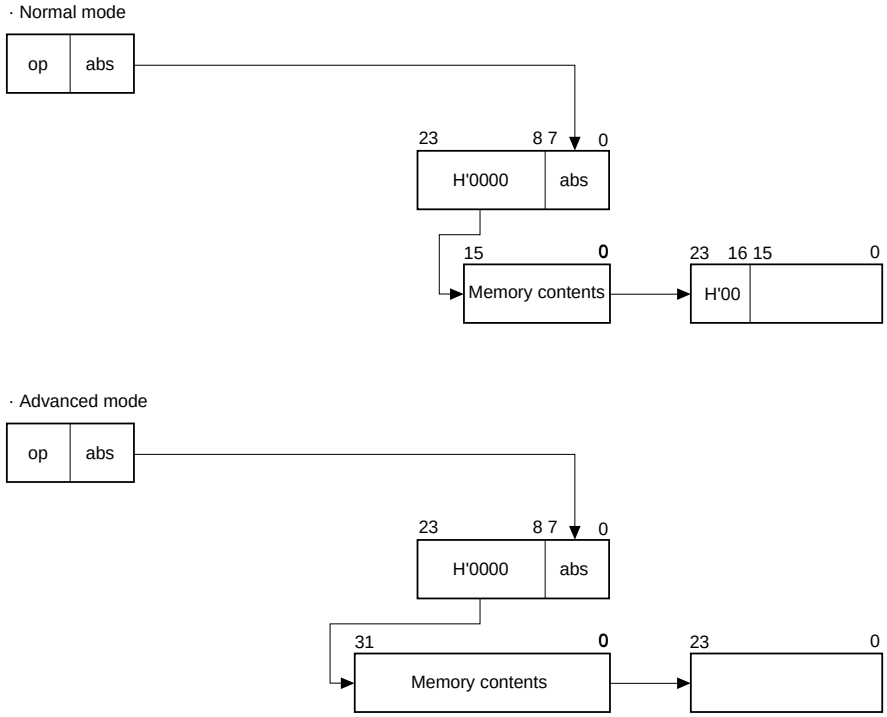
Table 2.13 explains how an effective address is calculated in each addressing mode. In the 1-Mbyte operating modes the upper 4 bits of the calculated address are ignored in order to generate a 20-bit effective address.

Table 2.13 Effective Address Calculation

No.	Addressing Mode and Instruction Format	Effective Address Calculation	Effective Address
1	Register direct (Rn) 		Operand is general register contents
2	Register indirect (@ERn) 		
3	Register indirect with displacement @(d:16, ERn)/@(d:24, ERn) 		
4	Register indirect with post-increment or pre-decrement Register indirect with post-increment @ERn+  Register indirect with pre-decrement @–ERn 	1 for a byte operand, 2 for a word operand, 4 for a longword operand	

No.	Addressing Mode and Instruction Format	Effective Address Calculation	Effective Address
5	Absolute address @aa:8   @aa:16   @aa:24  		
6	Immediate #xx:8, #xx:16, or #xx:32 		Operand is immediate data
7	Program-counter relative @(d:8, PC) or @(d:16, PC) 		

No.	Addressing Mode and Instruction Format	Effective Address Calculation	Effective Address
8	Memory indirect @@aa:8		



Legend:

abs: Absolute address

2.8 Processing States

2.8.1 Overview

The H8/300H CPU has five processing states: the program execution state, exception-handling state, power-down state, reset state, and bus-released state. The power-down state includes sleep mode, software standby mode, and hardware standby mode. Figure 2.10 classifies the processing states. Figure 2.12 indicates the state transitions.

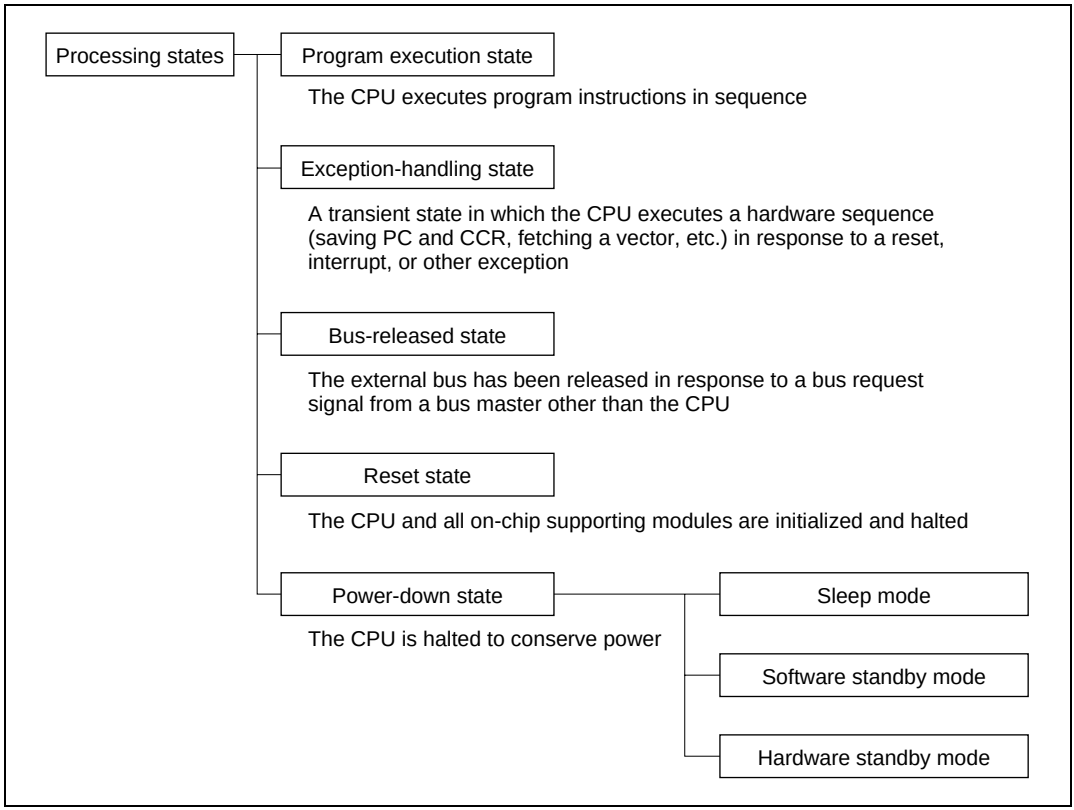

Figure 2.10 Processing States

2.8.2 Program Execution State

In this state the CPU executes program instructions in normal sequence.

2.8.3 Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal program flow due to a reset, interrupt, or trap instruction. The CPU fetches a starting address from the exception vector table and branches to that address. In interrupt and trap exception handling the CPU references the stack pointer (ER7) and saves the program counter and condition code register.

Types of Exception Handling and Their Priority: Exception handling is performed for resets, interrupts, and trap instructions. Table 2.14 indicates the types of exception handling and their priority. Trap instruction exceptions are accepted at all times in the program execution state.

Table 2.14 Exception Handling Types and Priority

Priority	Type of Exception	Detection Timing	Start of Exception Handling
High ↑ Low	Reset	Synchronized with clock	Exception handling starts immediately when $\overline{\text{RES}}$ changes from low to high
	Interrupt	End of instruction execution or end of exception handling*	When an interrupt is requested, exception handling starts at the end of the current instruction or current exception-handling sequence
	Trap instruction	When TRAPA instruction is executed	Exception handling starts when a trap (TRAPA) instruction is executed

Note: * Interrupts are not detected at the end of the ANDC, ORC, XORC, and LDC instructions, or immediately after reset exception handling.

Figure 2.11 classifies the exception sources. For further details about exception sources, vector numbers, and vector addresses, see section 4, Exception Handling, and section 5, Interrupt Controller.

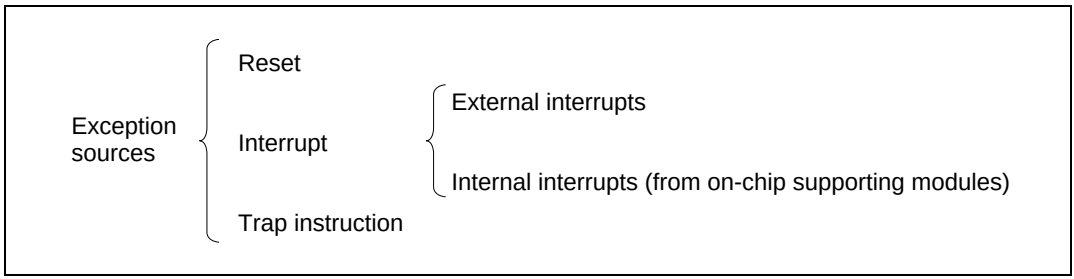

Figure 2.11 Classification of Exception Sources

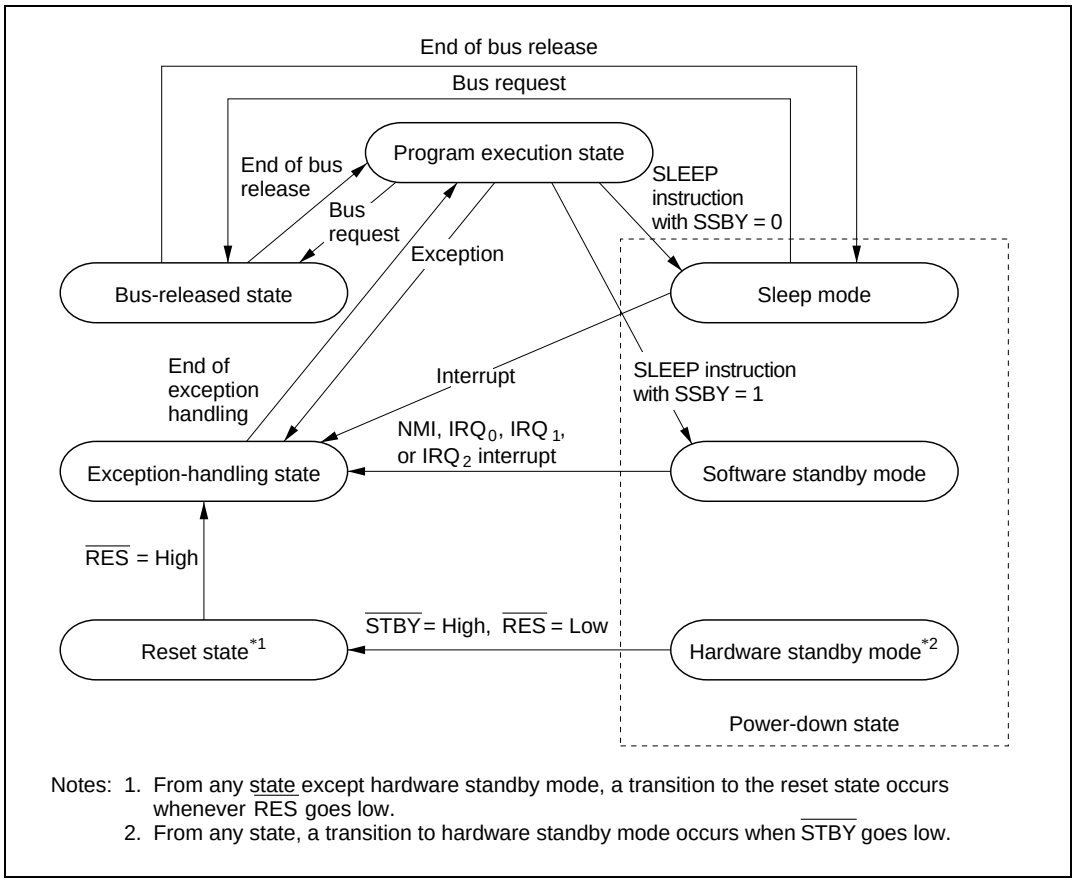


Notes: 1. From any state except hardware standby mode, a transition to the reset state occurs whenever $\overline{RES}$ goes low.
2. From any state, a transition to hardware standby mode occurs when $\overline{STBY}$ goes low.

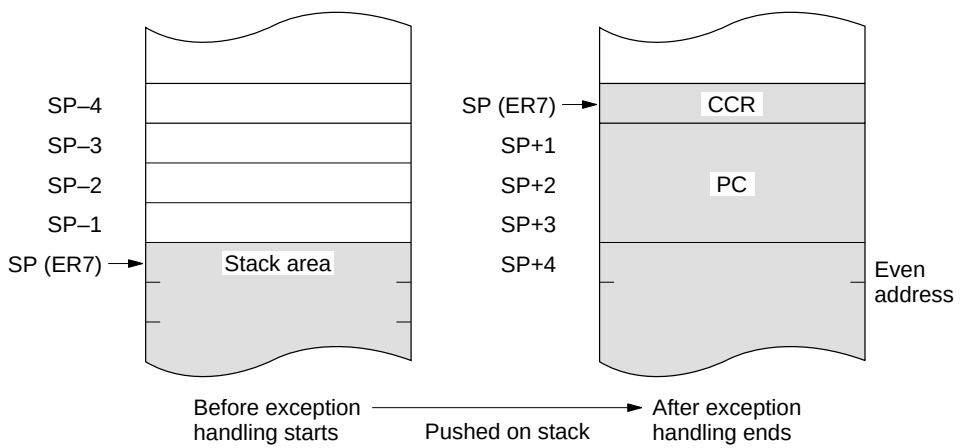
Figure 2.12 State Transitions

2.8.4 Exception-Handling Sequences

Reset Exception Handling: Reset exception handling has the highest priority. The reset state is entered when the $\overline{\text{RES}}$ signal goes low. Reset exception handling starts after that, when $\overline{\text{RES}}$ changes from low to high. When reset exception handling starts the CPU fetches a start address from the exception vector table and starts program execution from that address. All interrupts, including NMI, are disabled during the reset exception-handling sequence and immediately after it ends.

Interrupt Exception Handling and Trap Instruction Exception Handling: When these exception-handling sequences begin, the CPU references the stack pointer (ER7) and pushes the program counter and condition code register on the stack. Next, if the UE bit in the system control register (SYSCR) is set to 1, the CPU sets the I bit in the condition code register to 1. If the UE bit is cleared to 0, the CPU sets both the I bit and the UI bit in the condition code register to 1. Then the CPU fetches a start address from the exception vector table and execution branches to that address.

Figure 2.13 shows the stack after the exception-handling sequence.



Legend:
CCR: Condition code register
SP: Stack pointer

Notes: 1. PC is the address of the first instruction executed after the return from the exception-handling routine.
2. Registers must be saved and restored by word access or longword access, starting at an even address.

Figure 2.13 Stack Structure after Exception Handling

2.8.5 Bus-Released State

In this state the bus is released to a bus master other than the CPU, in response to a bus request. The bus masters other than the CPU are the DMA controller, the refresh controller, and an external bus master. While the bus is released, the CPU halts except for internal operations. Interrupt requests are not accepted. For details see section 6.3.7, Bus Arbiter Operation.

2.8.6 Reset State

When the $\overline{\text{RES}}$ input goes low all current processing stops and the CPU enters the reset state. The I bit in the condition code register is set to 1 by a reset. All interrupts are masked in the reset state. Reset exception handling starts when the $\overline{\text{RES}}$ signal changes from low to high.

The reset state can also be entered by a watchdog timer overflow. For details see section 12, Watchdog Timer.

2.8.7 Power-Down State

In the power-down state the CPU stops operating to conserve power. There are three modes: sleep mode, software standby mode, and hardware standby mode.

Sleep Mode: A transition to sleep mode is made if the SLEEP instruction is executed while the SSBY bit is cleared to 0 in the system control register (SYSCR). CPU operations stop immediately after execution of the SLEEP instruction, but the contents of CPU registers are retained.

Software Standby Mode: A transition to software standby mode is made if the SLEEP instruction is executed while the SSBY bit is set to 1 in SYSCR. The CPU and clock halt and all on-chip supporting modules stop operating. The on-chip supporting modules are reset, but as long as a specified voltage is supplied the contents of CPU registers and on-chip RAM are retained. The I/O ports also remain in their existing states.

Hardware Standby Mode: A transition to hardware standby mode is made when the $\overline{\text{STBY}}$ input goes low. As in software standby mode, the CPU and all clocks halt and the on-chip supporting modules are reset, but as long as a specified voltage is supplied, on-chip RAM contents are retained.

For further information see section 20, Power-Down State.

2.9 Basic Operational Timing

2.9.1 Overview

The H8/300H CPU operates according to the system clock (ϕ). The interval from one rise of the system clock to the next rise is referred to as a "state." A memory cycle or bus cycle consists of two or three states. The CPU uses different methods to access on-chip memory, the on-chip supporting modules, and the external address space. Access to the external address space can be controlled by the bus controller.

2.9.2 On-Chip Memory Access Timing

On-chip memory is accessed in two states. The data bus is 16 bits wide, permitting both byte and word access. Figure 2.14 shows the on-chip memory access cycle. Figure 2.15 indicates the pin states.

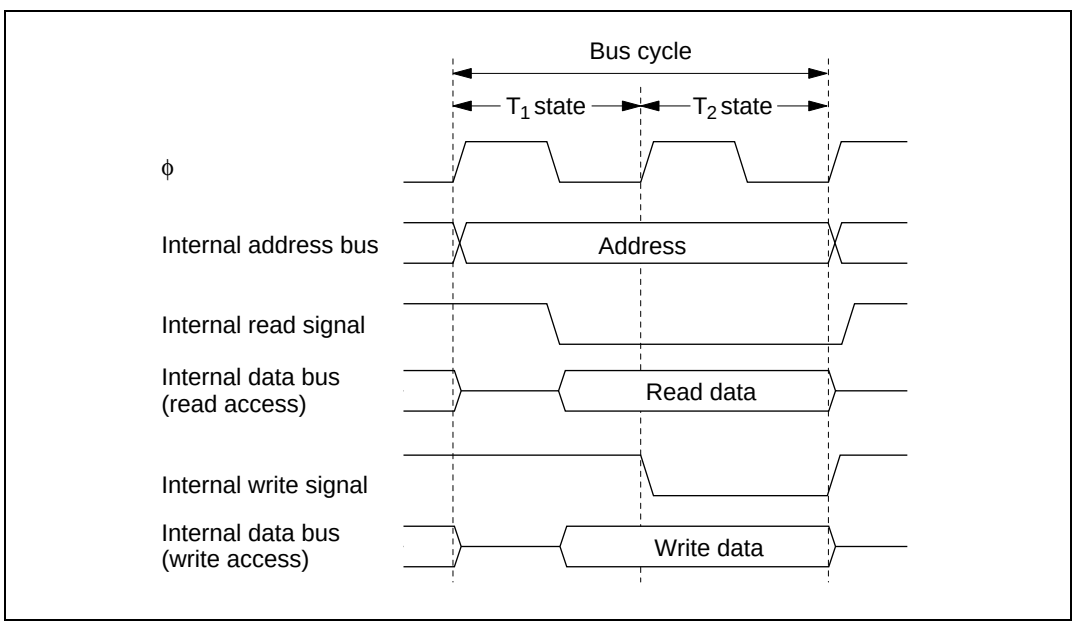


Figure 2.14 On-Chip Memory Access Cycle

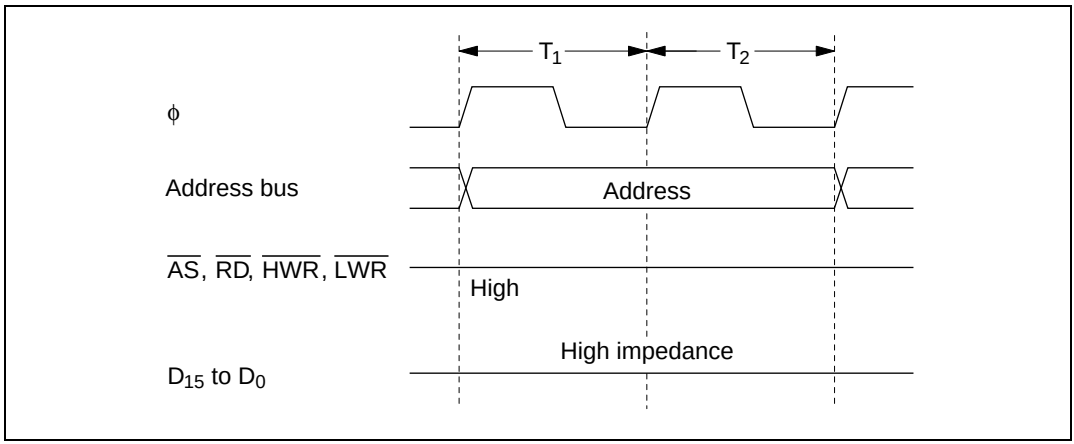

Figure 2.15 Pin States during On-Chip Memory Access

2.9.3 On-Chip Supporting Module Access Timing

The on-chip supporting modules are accessed in three states. The data bus is 8 or 16 bits wide, depending on the register being accessed. Figure 2.16 shows the on-chip supporting module access timing. Figure 2.17 indicates the pin states.

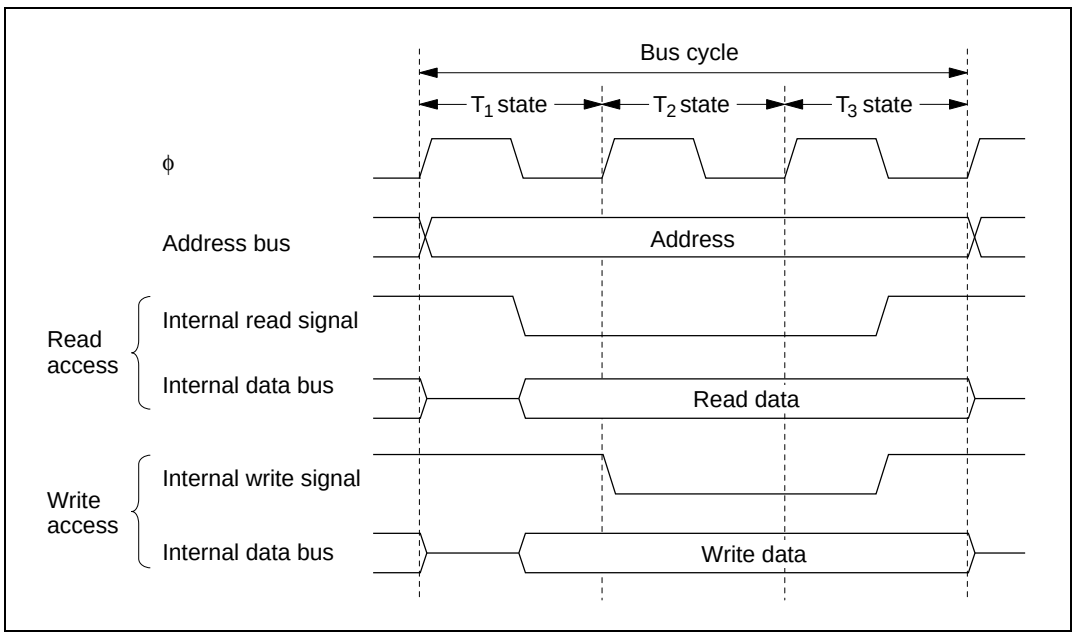

Figure 2.16 Access Cycle for On-Chip Supporting Modules

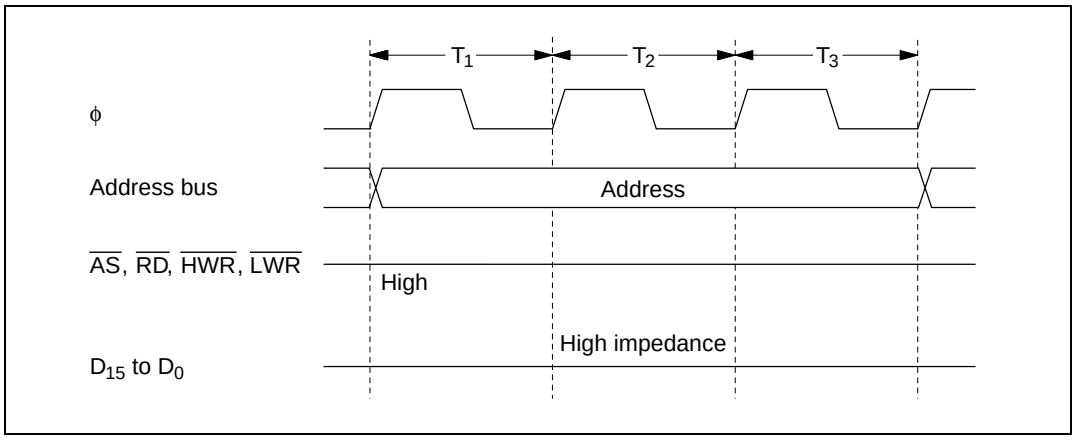

Figure 2.17 Pin States during Access to On-Chip Supporting Modules

2.9.4 Access to External Address Space

The external address space is divided into eight areas (areas 0 to 7). Bus-controller settings determine whether each area is accessed via an 8-bit or 16-bit bus, and whether it is accessed in two or three states. For details see section 6, Bus Controller.

Section 3 MCU Operating Modes

3.1 Overview

3.1.1 Operating Mode Selection

The H8/3052BF has seven operating modes (modes 1 to 7) that are selected by the mode pins (MD_2 to MD_0) as indicated in table 3.1. The input at these pins determines the size of the address space and the initial bus mode.

Table 3.1 Operating Mode Selection

	Mode Pins			Description			
Operating Mode*3	MD_2	MD_1	MD_0	Address Space	Initial Bus Mode*1	On-Chip ROM	On-Chip RAM
—	0	0	0	—	—	—	—
Mode 1	0	0	1	Expanded mode	8 bits	Disabled	Enabled*2
Mode 2	0	1	0	Expanded mode	16 bits	Disabled	Enabled*2
Mode 3	0	1	1	Expanded mode	8 bits	Disabled	Enabled*2
Mode 4	1	0	0	Expanded mode	16 bits	Disabled	Enabled*2
Mode 5	1	0	1	Expanded mode	8 bits	Enabled	Enabled*2
Mode 6	1	1	0	Expanded mode	8 bits	Enabled	Enabled*2
Mode 7	1	1	1	Single-chip advanced mode	—	Enabled	Enabled

Notes: 1. In modes 1 to 6, an 8-bit or 16-bit data bus can be selected on a per-area basis by settings made in the area bus width control register (ABWCR). For details see section 6, Bus Controller.
2. If the RAME bit in SYSCR is cleared to 0, these addresses become external addresses.
3. These are the operating modes when the FWE pin is at 0. For the operating modes when the FWE pin is at 1, see section 18, ROM.

For the address space size there are two choices: 1 Mbyte or 16 Mbytes. The external data bus is either 8 or 16 bits wide depending on ABWCR settings. If 8-bit access is selected for all areas, the external data bus is 8 bits wide. For details see section 6, Bus Controller.

Modes 1 to 4 are externally expanded modes that enable access to external memory and peripheral devices and disable access to the on-chip ROM. Modes 1 and 2 support a maximum address space of 1 Mbyte. Modes 3 and 4 support a maximum address space of 16 Mbytes.

Modes 5 and 6 are externally expanded modes that enable access to external memory and peripheral devices and also enable access to the on-chip ROM. Mode 5 supports a maximum address space of 1 Mbyte. Mode 6 supports a maximum address space of 16 Mbytes.

Mode 7 is a single-chip mode that operates using the on-chip ROM, RAM, and Internal I/O registers, and makes all I/O ports available. Mode 7 supports a 1-Mbyte address space.

The H8/3052BF can be used only in modes 1 to 7. The inputs at the mode pins must select one of these seven modes. The inputs at the mode pins must not be changed during operation.

3.1.2 Register Configuration

The H8/3052BF has a mode control register (MDCR) that indicates the inputs at the mode pins (MD_2 to MD_0), and a system control register (SYSCR). Table 3.2 summarizes these registers.

Table 3.2 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF1	Mode control register	MDCR	R	Undetermined
H'FFF2	System control register	SYSCR	R/W	H'0B

Note: * The lower 16 bits of the address are indicated.

3.2 Mode Control Register (MDCR)

MDCR is an 8-bit read-only register that indicates the current operating mode of the H8/3052BF.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	MDS2	MDS1	MDS0
Initial value	1	1	0	0	0	—*	—*	—*
Read/Write	—	—	—	—	—	R	R	R

Reserved bits (bits 7 and 6)

Reserved bits (bits 5 to 3)

Mode select 2 to 0 (bits 2 to 0)
Bits indicating the current operating mode

Note: * Determined by pins MD_2 to MD_0.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bits 5 to 3—Reserved: Read-only bits, always read as 0.

Bits 2 to 0—Mode Select 2 to 0 (MDS2 to MDS0): These bits indicate the logic levels at pins MD_2 to MD_0 (the current operating mode). MDS2 to MDS0 correspond to MD_2 to MD_0. MDS2 to MDS0 are read-only bits. The mode pin (MD_2 to MD_0) levels are latched into these bits when MDCR is read.

3.3 System Control Register (SYSCR)

SYSCR is an 8-bit register that controls the operation of the H8/3052BF.

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

RAM enable
Enables or disables on-chip RAM

Reserved bit

NMI edge select
Selects the valid edge of the NMI input

User bit enable
Selects whether to use the UI bit in CCR as a user bit or an interrupt mask bit

Standby timer select 2 to 0
These bits select the waiting time at recovery from software standby mode

Software standby
Enables transition to software standby mode

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. (For further information about software standby mode see section 20, Power-Down State.)

When software standby mode is exited by an external interrupt, this bit remains set to 1. To clear this bit, write 0.

Bit 7: SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the internal clock oscillator to settle when software standby mode is exited by an external interrupt. When using a crystal oscillator, set these bits so that the waiting time will be at least 7 ms at the system clock rate. For further information about waiting time selection, see section 20.4.3, Selection of Waiting Time for Exit from Software Standby Mode.

Bit 6: STS2	Bit 5: STS1	Bit 4: STS0	Description	
0	0	0	Waiting time = 8,192 states	(Initial value)
		1	Waiting time = 16,384 states	
	1	0	Waiting time = 32,768 states	
		1	Waiting time = 65,536 states	
1	0	0	Waiting time = 131,072 states	
		1	Waiting time = 1,024 states	
	1	—	Illegal setting	

Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in the condition code register as a user bit or an interrupt mask bit.

Bit 3: UE	Description	
0	UI bit in CCR is used as an interrupt mask bit	
1	UI bit in CCR is used as a user bit	(Initial value)

Bit 2—NMI Edge Select (NMIEG): Selects the valid edge of the NMI input.

Bit 2: NMIEG	Description	
0	An interrupt is requested at the falling edge of NMI	(Initial value)
1	An interrupt is requested at the rising edge of NMI	

Bit 1—Reserved: Read-only bit, always read as 1.

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized by the rising edge of the $\overline{\text{RES}}$ signal. It is not initialized in software standby mode.

Bit 0: RAME	Description	
0	On-chip RAM is disabled	
1	On-chip RAM is enabled	(Initial value)

3.4 Operating Mode Descriptions

3.4.1 Mode 1

Ports 1, 2, and 5 function as address pins A_{19} to A_0, permitting access to a maximum 1-Mbyte address space. The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits.

3.4.2 Mode 2

Ports 1, 2, and 5 function as address pins A_{19} to A_0, permitting access to a maximum 1-Mbyte address space. The initial bus mode after a reset is 16 bits, with 16-bit access to all areas. If all areas are designated for 8-bit access in ABWCR, the bus mode switches to 8 bits.

3.4.3 Mode 3

Ports 1, 2, and 5 and part of port A function as address pins A_{23} to A_0, permitting access to a maximum 16-Mbyte address space. The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits. A_{23} to A_{21} are valid when 0 is written in bits 7 to 5 of the bus release control register (BRCR). (In this mode A_{20} is always used for address output.)

3.4.4 Mode 4

Ports 1, 2, and 5 and part of port A function as address pins A_{23} to A_0, permitting access to a maximum 16-Mbyte address space. The initial bus mode after a reset is 16 bits, with 16-bit access to all areas. If all areas are designated for 8-bit access in ABWCR, the bus mode switches to 8 bits. A_{23} to A_{21} are valid when 0 is written in bits 7 to 5 of BRCR. (In this mode A_{20} is always used for address output.)

3.4.5 Mode 5

Ports 1, 2, and 5 can function as address pins A_{19} to A_0, permitting access to a maximum 1-Mbyte address space, but following a reset they are input ports. To use ports 1, 2, and 5 as an address bus, the corresponding bits in their data direction registers (P1DDR, P2DDR, and P5DDR) must be set to 1. The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits.

3.4.6 Mode 6

Ports 1, 2, and 5 and part of port A function as address pins A_{23} to A_0, permitting access to a maximum 16-Mbyte address space, but following a reset they are input ports. To use ports 1, 2, and 5 as an address bus, the corresponding bits in their data direction registers (P1DDR, P2DDR, and P5DDR) must be set to 1. For A_{23} to A_{21} output, clear bits 7 to 5 of BRCR to 0. (In this mode A_{20} is always used for address output.)

The initial bus mode after a reset is 8 bits, with 8-bit access to all areas. If at least one area is designated for 16-bit access in ABWCR, the bus mode switches to 16 bits.

3.4.7 Mode 7

This mode operates using the on-chip ROM, RAM, and registers. All I/O ports are available. Mode 7 supports a 1-Mbyte address space.

3.5 Pin Functions in Each Operating Mode

The pin functions of ports 1 to 5 and port A vary depending on the operating mode. Table 3.3 indicates their functions in each operating mode.

Table 3.3 Pin Functions in Each Mode

Port	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
Port 1	A_7 to A_0	A_7 to A_0	A_7 to A_0	A_7 to A_0	$P1_7$ to $P1_0$*2	$P1_7$ to $P1_0$*2	$P1_7$ to $P1_0$
Port 2	A_{15} to A_8	A_{15} to A_8	A_{15} to A_8	A_{15} to A_8	$P2_7$ to $P2_0$*2	$P2_7$ to $P2_0$*2	$P2_7$ to $P2_0$
Port 3	D_{15} to D_8	D_{15} to D_8	D_{15} to D_8	D_{15} to D_8	D_{15} to D_8	D_{15} to D_8	$P3_7$ to $P3_0$
Port 4	$P4_7$ to $P4_0$*1	D_7 to D_0*1	$P4_7$ to $P4_0$*1	D_7 to D_0*1	$P4_7$ to $P4_0$*1	$P4_7$ to $P4_0$*1	$P4_7$ to $P4_0$
Port 5	A_{19} to A_{16}	A_{19} to A_{16}	A_{19} to A_{16}	A_{19} to A_{16}	$P5_3$ to $P5_0$*2	$P5_3$ to $P5_0$*2	$P5_3$ to $P5_0$
Port A	PA_7 to PA_4	PA_7 to PA_4	PA_7 to PA_5*3, A_{20}	PA_7 to PA_5*3, A_{20}	PA_7 to PA_4	PA_7 to PA_5, A_{20}*3	PA_7 to PA_4

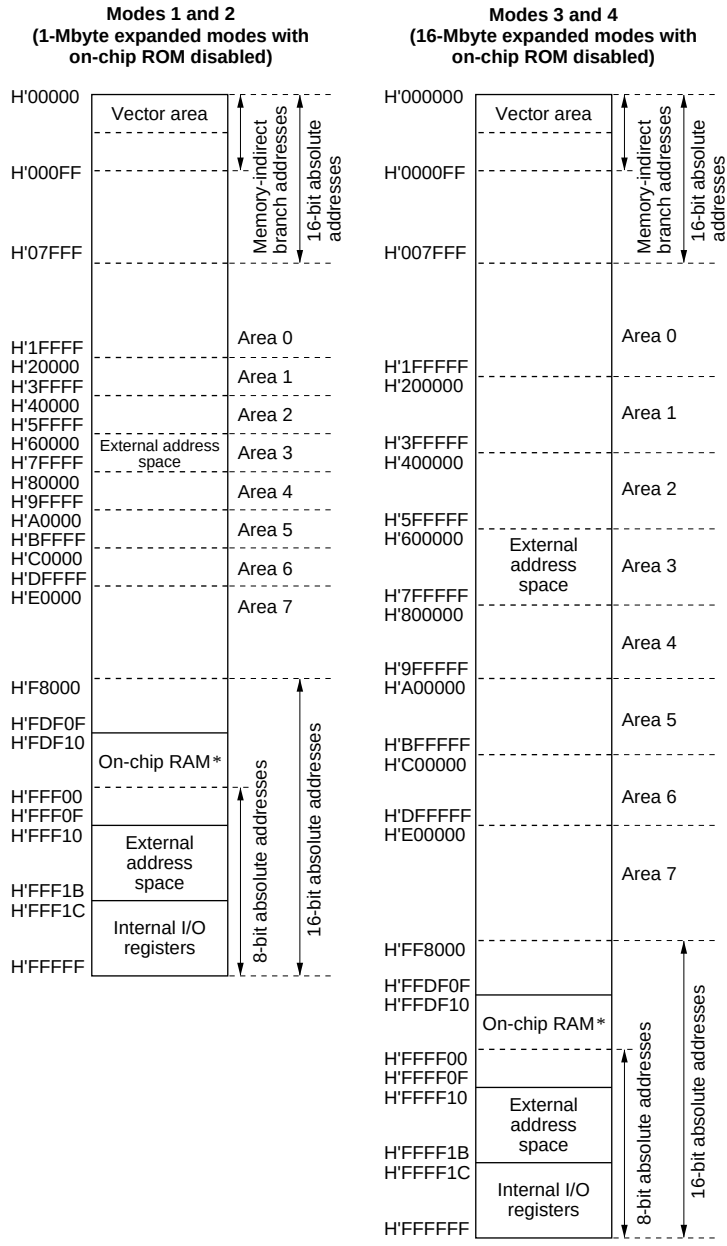
Notes: 1. Initial state. The bus mode can be switched by settings in ABWCR. These pins function as $P4_7$ to $P4_0$ in 8-bit bus mode, and as D_7 to D_0 in 16-bit bus mode.
2. Initial state. These pins become address output pins when the corresponding bits in the data direction registers (P1DDR, P2DDR, P5DDR) are set to 1.
3. Initial state. A_{20} is always an address output pin. PA_7 to PA_5 are switched over to A_{23} to A_{21} output by writing 0 in bits 7 to 5 of BRCR.

3.6 Memory Map in Each Operating Mode

Figure 3.1 shows a memory map of the H8/3052BF. The address space is divided into eight areas.

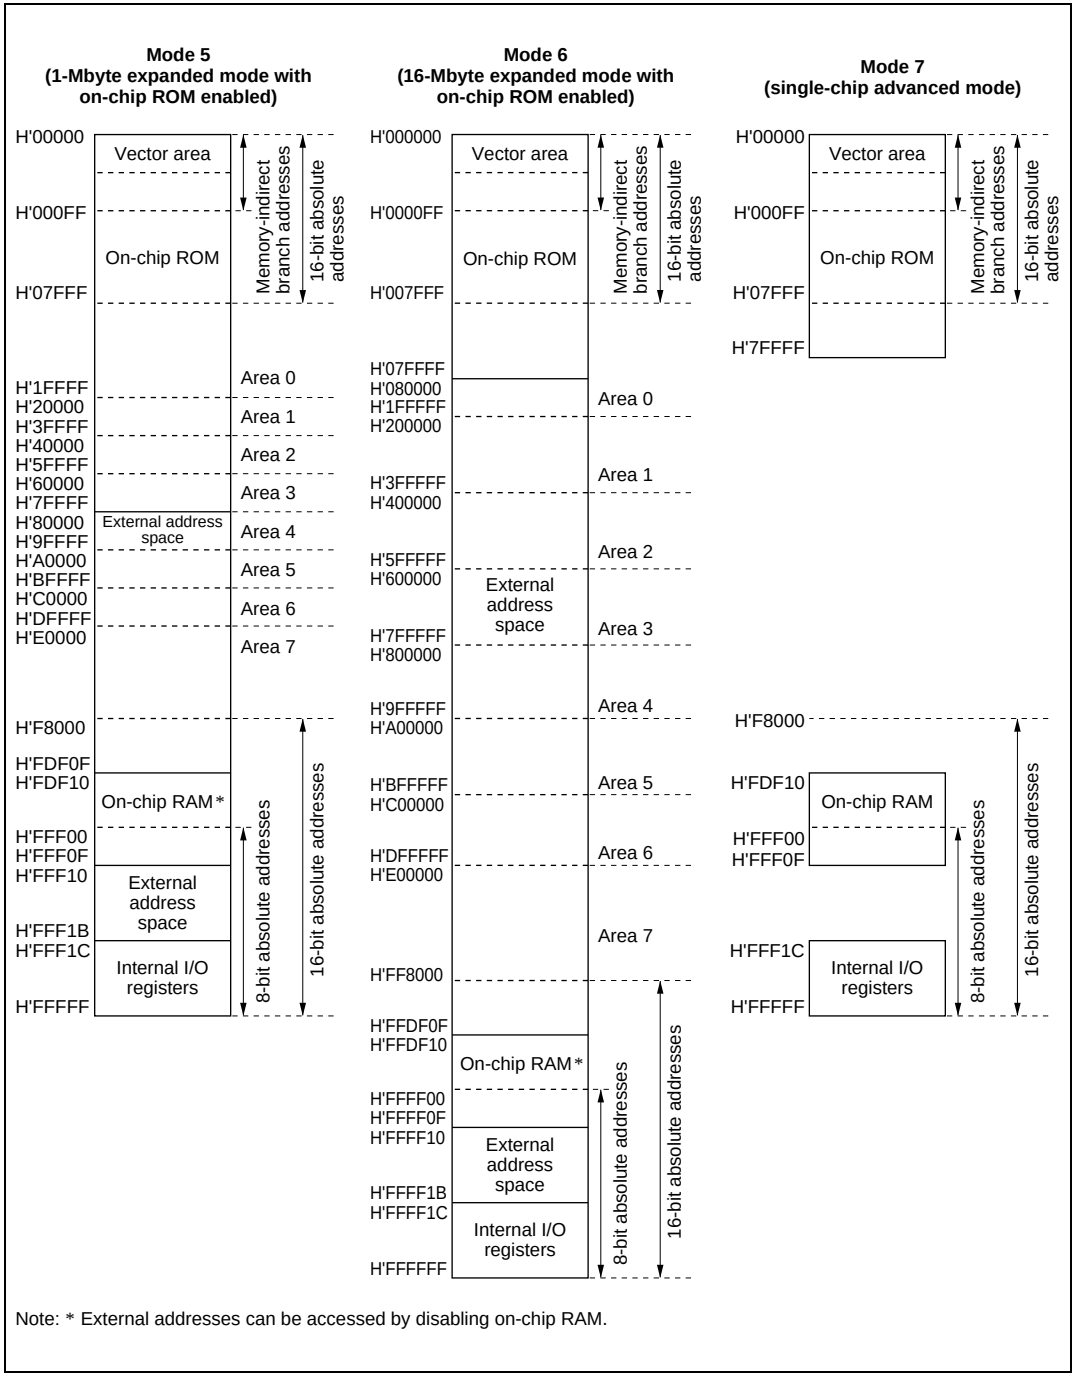
The initial bus mode differs between modes 1 and 2, and also between modes 3 and 4.

The address locations of the on-chip RAM and on-chip registers differ between the 1-Mbyte modes (modes 1, 2, 5, and 7) and 16-Mbyte modes (modes 3, 4, and 6). The address range specifiable by the CPU in the 8- and 16-bit absolute addressing modes (@aa:8 and @aa:16) also differs.



Note: * External addresses can be accessed by disabling on-chip RAM.

Figure 3.1 H8/3052BF Memory Map in Each Operating Mode



Note: * External addresses can be accessed by disabling on-chip RAM.

Figure 3.1 H8/3052BF Memory Map in Each Operating Mode (cont)

Section 4 Exception Handling

4.1 Overview

4.1.1 Exception Handling Types and Priority

As table 4.1 indicates, exception handling may be caused by a reset, trap instruction, or interrupt. Exception handling is prioritized as shown in table 4.1. If two or more exceptions occur simultaneously, they are accepted and processed in priority order. Trap instruction exceptions are accepted at all times in the program execution state.

Table 4.1 Exception Types and Priority

Priority	Exception Type	Start of Exception Handling
High ↑ Low	Reset	Starts immediately after a low-to-high transition at the $\overline{\text{RES}}$ pin
	Interrupt	Interrupt requests are handled when execution of the current instruction or handling of the current exception is completed
	Trap instruction (TRAPA)	Started by execution of a trap instruction (TRAPA)

4.1.2 Exception Handling Operation

Exceptions originate from various sources. Trap instructions and interrupts are handled as follows.

1. The program counter (PC) and condition code register (CCR) are pushed onto the stack.
2. The CCR interrupt mask bit is set to 1.
3. A vector address corresponding to the exception source is generated, and program execution starts from the address indicated in that address.

For a reset exception, steps 2 and 3 above are carried out.

4.1.3 Exception Sources and Vector Table

The exception sources are classified as shown in figure 4.1. Different vectors are assigned to different exception sources. Table 4.2 lists the exception sources and their vector addresses.

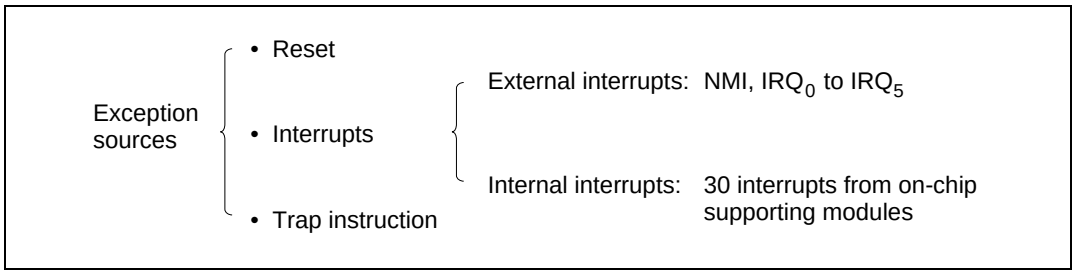


Figure 4.1 Exception Sources

Table 4.2 Exception Vector Table

Exception Source	Vector Number	Vector Address*1
Reset	0	H'0000 to H'0003
Reserved for system use	1	H'0004 to H'0007
	2	H'0008 to H'000B
	3	H'000C to H'000F
	4	H'0010 to H'0013
	5	H'0014 to H'0017
	6	H'0018 to H'001B
External interrupt (NMI)	7	H'001C to H'001F
Trap instruction (4 sources)	8	H'0020 to H'0023
	9	H'0024 to H'0027
	10	H'0028 to H'002B
	11	H'002C to H'002F
External interrupt IRQ_0	12	H'0030 to H'0033
External interrupt IRQ_1	13	H'0034 to H'0037
External interrupt IRQ_2	14	H'0038 to H'003B
External interrupt IRQ_3	15	H'003C to H'003F
External interrupt IRQ_4	16	H'0040 to H'0043
External interrupt IRQ_5	17	H'0044 to H'0047
Reserved for system use	18	H'0048 to H'004B
	19	H'004C to H'004F
Internal interrupts*2	20 to 60	H'0050 to H'0053 to H'00F0 to H'00F3

Notes: 1. Lower 16 bits of the address.
2. For the internal interrupt vectors, see section 5.3.3, Interrupt Exception Vector Table.

4.2 Reset

4.2.1 Overview

A reset is the highest-priority exception. When the $\overline{\text{RES}}$ pin goes low, all processing halts and the chip enters the reset state. A reset initializes the internal state of the CPU and the registers of the on-chip supporting modules. Reset exception handling begins when the $\overline{\text{RES}}$ pin changes from low to high.

The chip can also be reset by overflow of the watchdog timer. For details see section 12, Watchdog Timer.

4.2.2 Reset Sequence

The chip enters the reset state when the $\overline{\text{RES}}$ pin goes low.

To ensure that the chip is reset, hold the $\overline{\text{RES}}$ pin low for at least 20 ms at power-up. To reset the chip during operation, hold the $\overline{\text{RES}}$ pin low for at least 20 system clock (ϕ) cycles. See appendix D.2, Pin States at Reset, for the states of the pins in the reset state.

When the $\overline{\text{RES}}$ pin goes high after being held low for the necessary time, the chip starts reset exception handling as follows.

- The internal state of the CPU and the registers of the on-chip supporting modules are initialized, and the I bit is set to 1 in CCR.
- The contents of the reset vector address (H'0000 to H'0003) are read, and program execution starts from the address indicated in the vector address.

Figure 4.2 shows the reset sequence in modes 1 and 3. Figure 4.3 shows the reset sequence in modes 2 and 4. Figure 4.4 shows the reset sequence in modes 5 to 7.

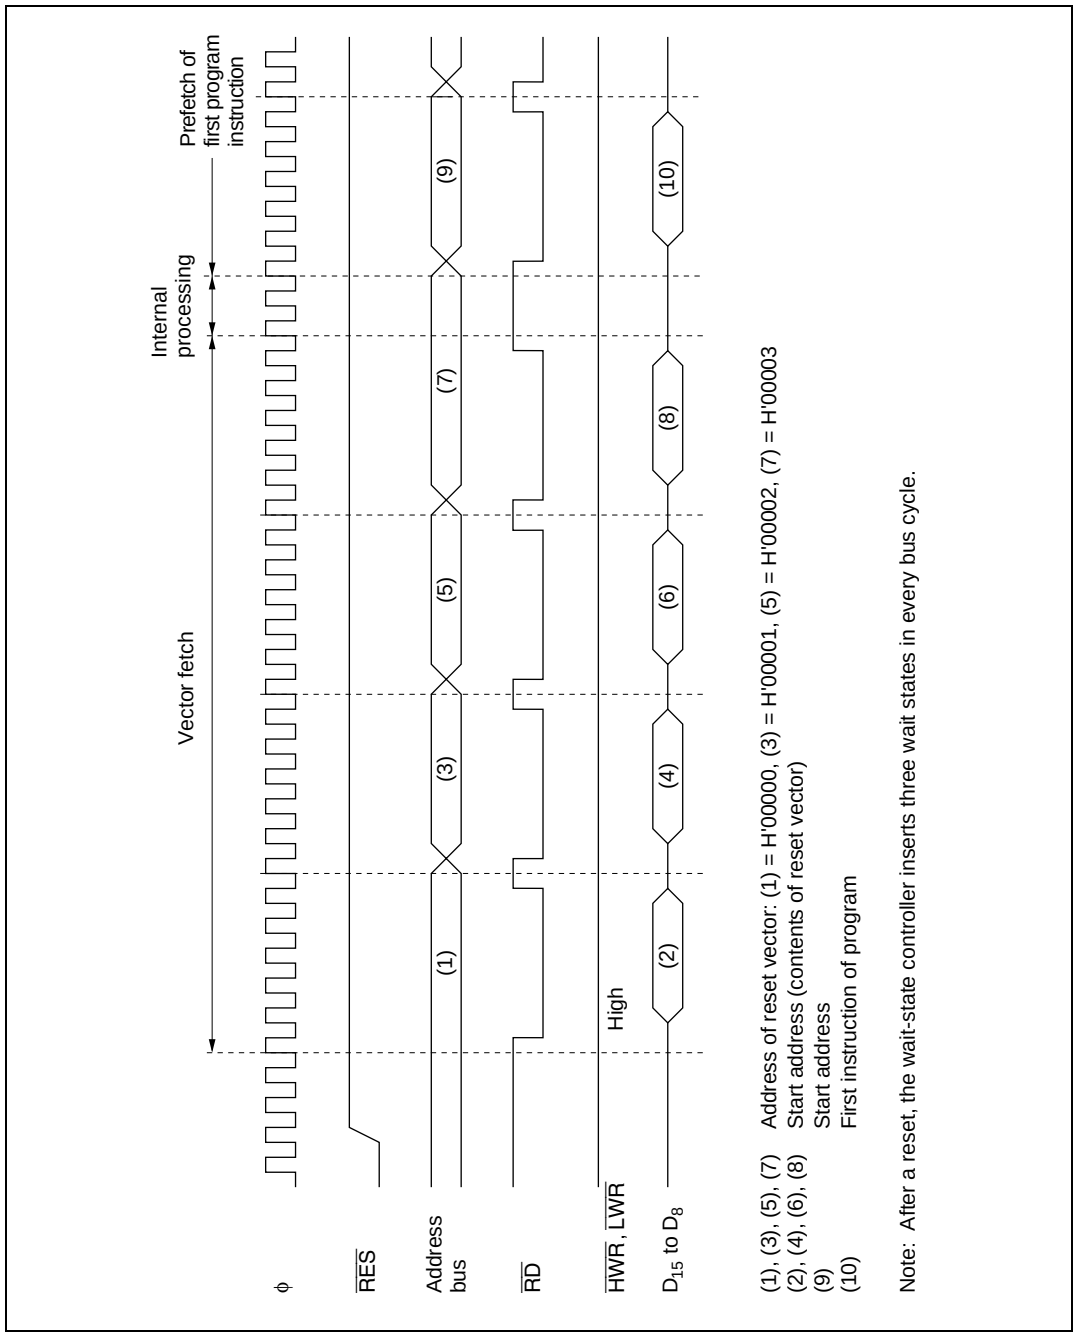

Figure 4.2 Reset Sequence (Modes 1 and 3)

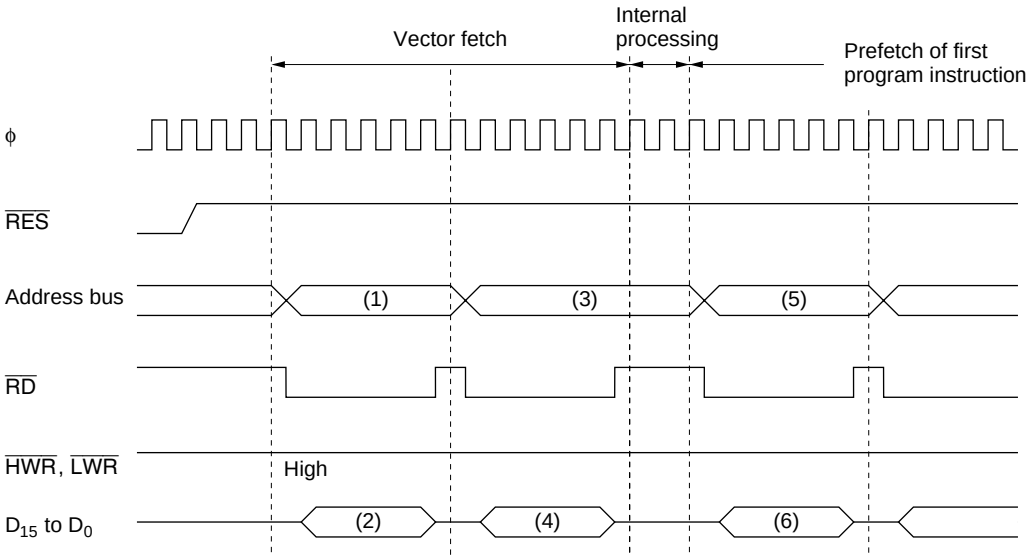

(1), (3) Address of reset vector: (1) = H'000000, (3) = H'000002
(2), (4) Start address (contents of reset vector)
(5) Start address
(6) First instruction of program

Note: After a reset, the wait-state controller inserts three wait states in every bus cycle.

Figure 4.3 Reset Sequence (Modes 2 and 4)

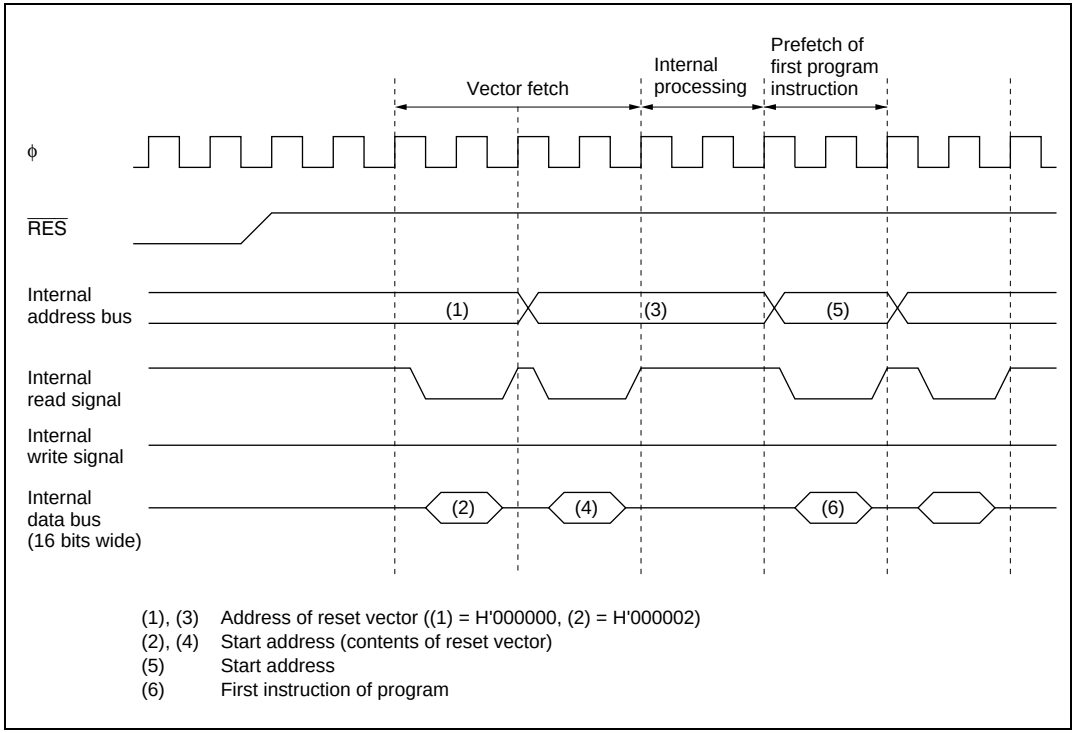

Figure 4.4 Reset Sequence (Modes 5 to 7)

4.2.3 Interrupts after Reset

If an interrupt is accepted after a reset but before the stack pointer (SP) is initialized, PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset. The first instruction of the program is always executed immediately after the reset state ends. This instruction should initialize the stack pointer (example: MOV.L #xx:32, SP).

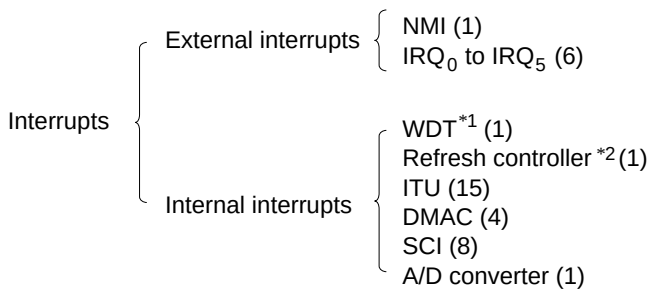
4.3 Interrupts

Interrupt exception handling can be requested by seven external sources (NMI, IRQ_0 to IRQ_5) and 30 internal sources in the on-chip supporting modules. Figure 4.5 classifies the interrupt sources and indicates the number of interrupts of each type.

The on-chip supporting modules that can request interrupts are the watchdog timer (WDT), refresh controller, 16-bit integrated timer unit (ITU), DMA controller (DMAC), serial communication interface (SCI), and A/D converter. Each interrupt source has a separate vector address.

NMI is the highest-priority interrupt and is always accepted. Interrupts are controlled by the interrupt controller. The interrupt controller can assign interrupts other than NMI to two priority levels, and arbitrate between simultaneous interrupts. Interrupt priorities are assigned in interrupt priority registers A and B (IPRA and IPRB) in the interrupt controller.

For details on interrupts see section 5, Interrupt Controller.



Notes: Numbers in parentheses are the number of interrupt sources.
1. When the watchdog timer is used as an interval timer, it generates an interrupt request at every counter overflow.
2. When the refresh controller is used as an interval timer, it generates an interrupt request at compare match.

Figure 4.5 Interrupt Sources and Number of Interrupts

4.4 Trap Instruction

Trap instruction exception handling starts when a TRAPA instruction is executed. If the UE bit is set to 1 in the system control register (SYSCR), the exception handling sequence sets the I bit to 1 in CCR. If the UE bit is 0, the I and UI bits are both set to 1. The TRAPA instruction fetches a start address from a vector table entry corresponding to a vector number from 0 to 3, which is specified in the instruction code.

4.5 Stack Status after Exception Handling

Figure 4.6 shows the stack after completion of trap instruction exception handling and interrupt exception handling.

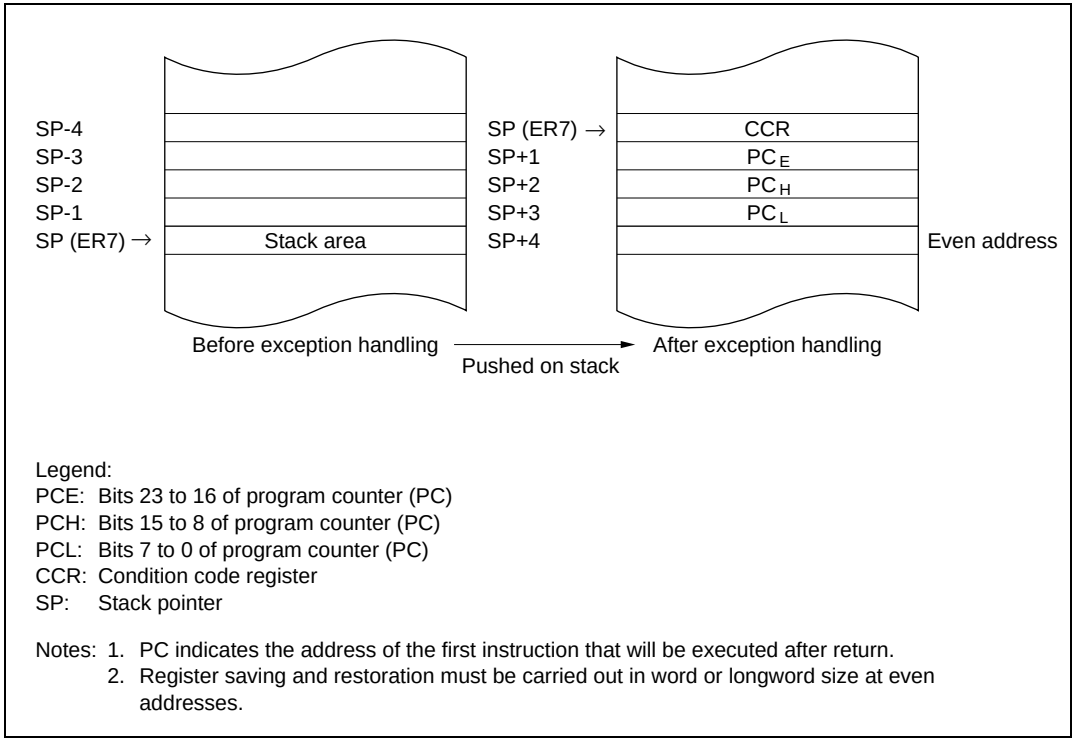


Figure 4.6 Stack after Completion of Exception Handling

4.6 Notes on Use of the Stack

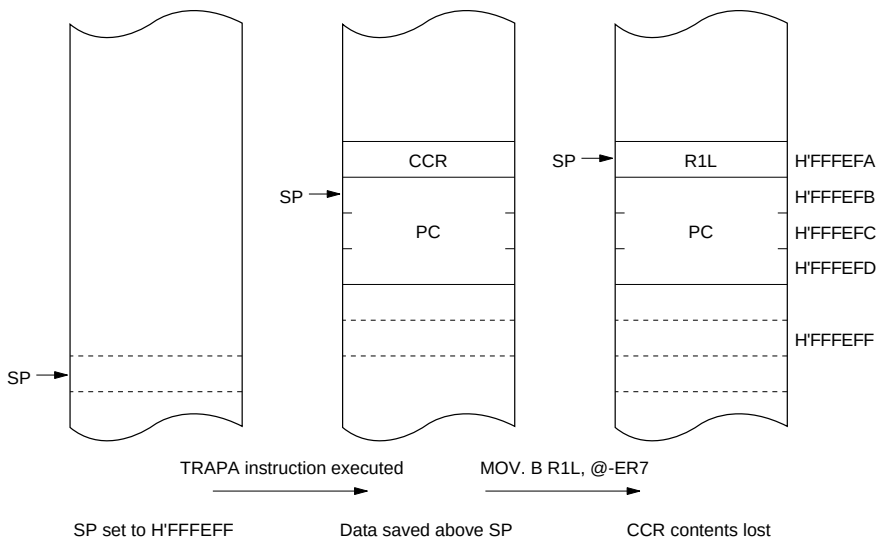
When accessing word data or longword data, the H8/3052BF regards the lowest address bit as 0. The stack should always be accessed by word access or longword access, and the value of the stack pointer (SP, ER7) should always be kept even. Use the following instructions to save registers:

PUSH.W Rn (or MOV.W Rn, @–SP)
PUSH.L ERn (or MOV.L ERn, @–SP)

Use the following instructions to restore registers:

POP.W Rn (or MOV.W @SP+, Rn)
POP.L ERn (or MOV.L @SP+, ERn)

Setting SP to an odd value may lead to a malfunction. Figure 4.7 shows an example of what happens when the SP value is odd.



Legend:
CCR: Condition code register
PC: Program counter
R1L: General register R1L
SP: Stack pointer

Note: The diagram illustrates modes 3 and 4.

Figure 4.7 Operation when SP Value Is Odd

Section 5 Interrupt Controller

5.1 Overview

5.1.1 Features

The interrupt controller has the following features:

- Interrupt priority registers (IPRs) for setting interrupt priorities
  Interrupts other than NMI can be assigned to two priority levels on a source-by-source or module-by-module basis in interrupt priority registers A and B (IPRA and IPRB).
- Three-level masking by the I and UI bits in the CPU condition code register (CCR)
- Independent vector addresses
  All interrupts are independently vectored; the interrupt service routine does not have to identify the interrupt source.
- Seven external interrupt pins
  NMI has the highest priority and is always accepted; either the rising or falling edge can be selected. For each of IRQ_0 to IRQ_5, falling edge or level sensing can be selected independently.

5.1.2 Block Diagram

Figure 5.1 shows a block diagram of the interrupt controller.

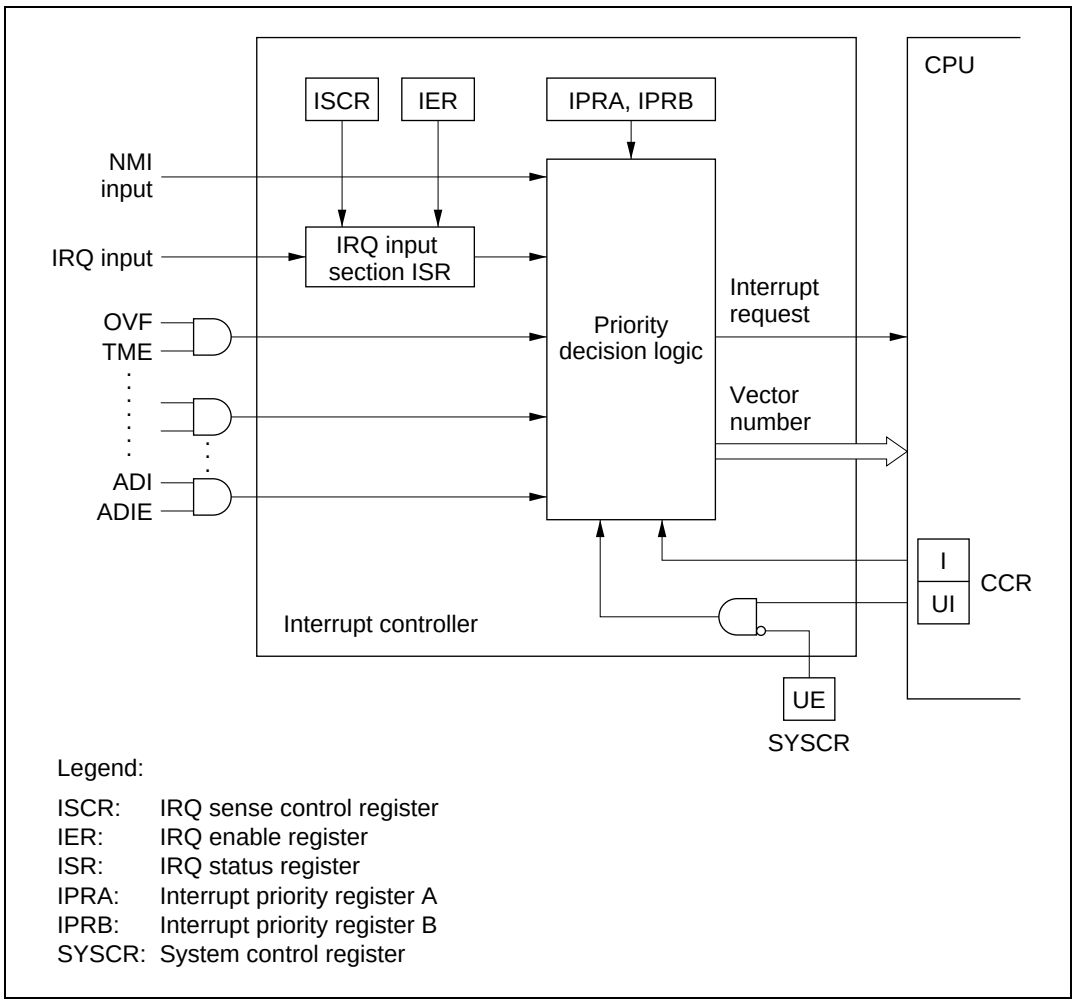


Figure 5.1 Interrupt Controller Block Diagram

5.1.3 Pin Configuration

Table 5.1 lists the interrupt pins.

Table 5.1 Interrupt Pins

Name	Abbreviation	I/O	Function
Nonmaskable interrupt	NMI	Input	Nonmaskable external interrupt, rising edge or falling edge selectable
External interrupt request 5 to 0	$\overline{IRQ_5}$ to $\overline{IRQ_0}$	Input	Maskable external interrupts, falling edge or level sensing selectable

5.1.4 Register Configuration

Table 5.2 lists the registers of the interrupt controller.

Table 5.2 Interrupt Controller Registers

Address*1	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B
H'FFF4	IRQ sense control register	ISCR	R/W	H'00
H'FFF5	IRQ enable register	IER	R/W	H'00
H'FFF6	IRQ status register	ISR	R/(W)*2	H'00
H'FFF8	Interrupt priority register A	IPRA	R/W	H'00
H'FFF9	Interrupt priority register B	IPRB	R/W	H'00

Notes: 1. Lower 16 bits of the address.
2. Only 0 can be written, to clear flags.

5.2 Register Descriptions

5.2.1 System Control Register (SYSCR)

SYSCR is an 8-bit readable/writable register that controls software standby mode, selects the action of the UI bit in CCR, selects the NMI edge, and enables or disables the on-chip RAM.

Only bits 3 and 2 are described here. For the other bits, see section 3.3, System Control Register (SYSCR).

SYSCR is initialized to H'0B by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

RAM enable

Reserved bit

NMI edge select
Selects the NMI input edge

Standby timer select 2 to 0

Software standby

User bit enable
Selects whether to use the UI bit in CCR as a user bit or interrupt mask bit

Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in CCR as a user bit or an interrupt mask bit.

Bit 3: UE	Description	
0	UI bit in CCR is used as interrupt mask bit	
1	UI bit in CCR is used as user bit	(Initial value)

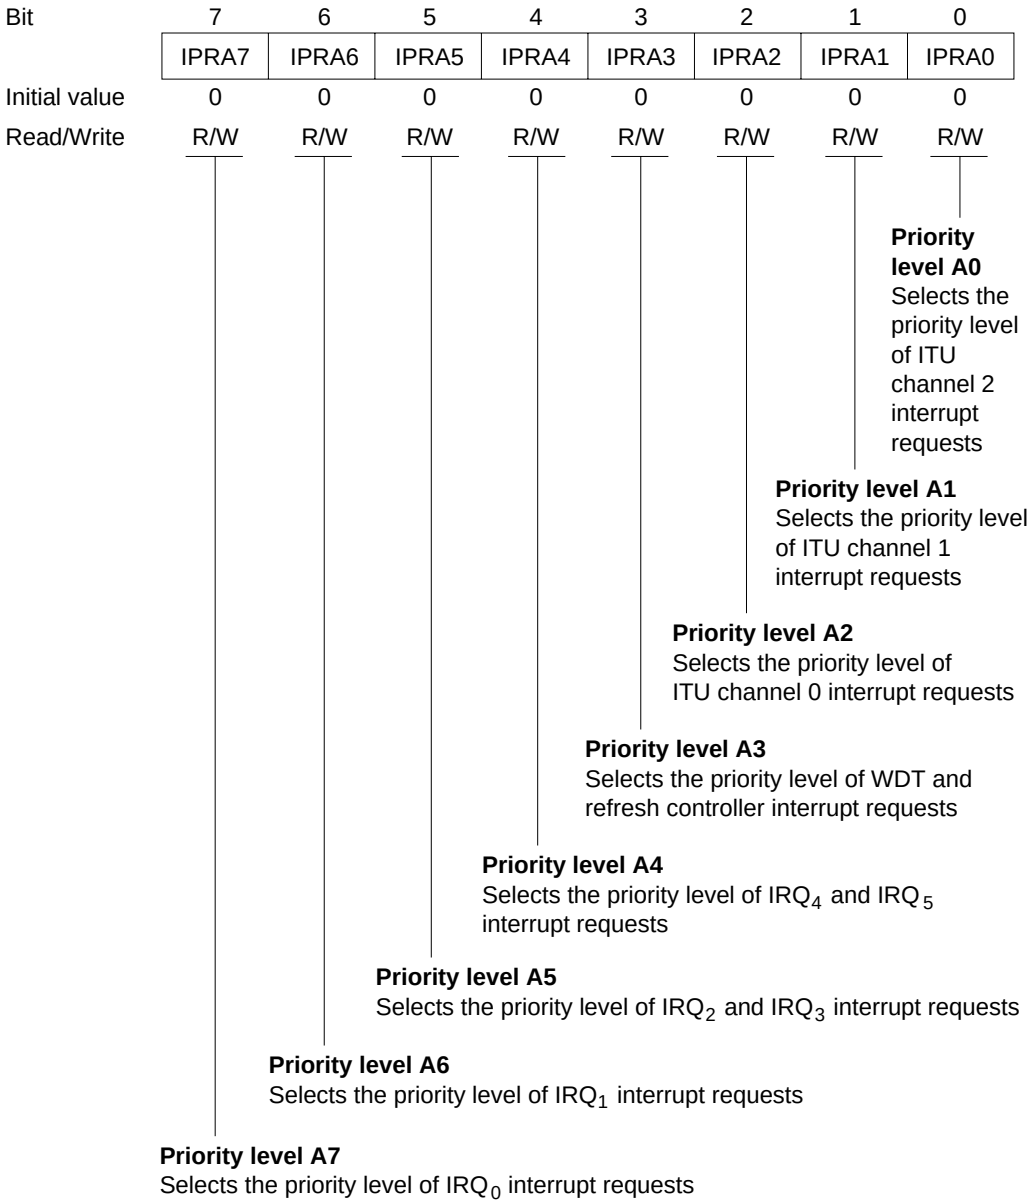
Bit 2—NMI Edge Select (NMIEG): Selects the NMI input edge.

Bit 2: NMIEG	Description	
0	Interrupt is requested at falling edge of NMI input	(Initial value)
1	Interrupt is requested at rising edge of NMI input	

5.2.2 Interrupt Priority Registers A and B (IPRA, IPRB)

IPRA and IPRB are 8-bit readable/writable registers that control interrupt priority.

Interrupt Priority Register A (IPRA): IPRA is an 8-bit readable/writable register in which interrupt priority levels can be set.



IPRA is initialized to H'00 by a reset and in hardware standby mode.

Bit 7—Priority Level A7 (IPRA7): Selects the priority level of IRQ_0 interrupt requests.

Bit 7: IPRA7	Description	
0	IRQ_0 interrupt requests have priority level 0 (Non-priority)	(Initial value)
1	IRQ_0 interrupt requests have priority level 1 (Priority)	

Bit 6—Priority Level A6 (IPRA6): Selects the priority level of IRQ_1 interrupt requests.

Bit 6: IPRA6	Description	
0	IRQ_1 interrupt requests have priority level 0 (Non-priority)	(Initial value)
1	IRQ_1 interrupt requests have priority level 1 (Priority)	

Bit 5—Priority Level A5 (IPRA5): Selects the priority level of IRQ_2 and IRQ_3 interrupt requests.

Bit 5: IPRA5	Description	
0	IRQ_2 and IRQ_3 interrupt requests have priority level 0 (Non-priority)	(Initial value)
1	IRQ_2 and IRQ_3 interrupt requests have priority level 1 (Priority)	

Bit 4—Priority Level A4 (IPRA4): Selects the priority level of IRQ_4 and IRQ_5 interrupt requests.

Bit 4: IPRA4	Description	
0	IRQ_4 and IRQ_5 interrupt requests have priority level 0 (Non-priority)	(Initial value)
1	IRQ_4 and IRQ_5 interrupt requests have priority level 1 (Priority)	

Bit 3—Priority Level A3 (IPRA3): Selects the priority level of WDT and refresh controller interrupt requests.

Bit 3: IPRA3	Description	
0	WDT and refresh controller interrupt requests have priority level 0 (Non-priority)	(Initial value)
1	WDT and refresh controller interrupt requests have priority level 1 (Priority)	

Bit 2—Priority Level A2 (IPRA2): Selects the priority level of ITU channel 0 interrupt requests.

Bit 2: IPRA2	Description
0	ITU channel 0 interrupt requests have priority level 0 (Non-priority) (Initial value)
1	ITU channel 0 interrupt requests have priority level 1 (Priority)

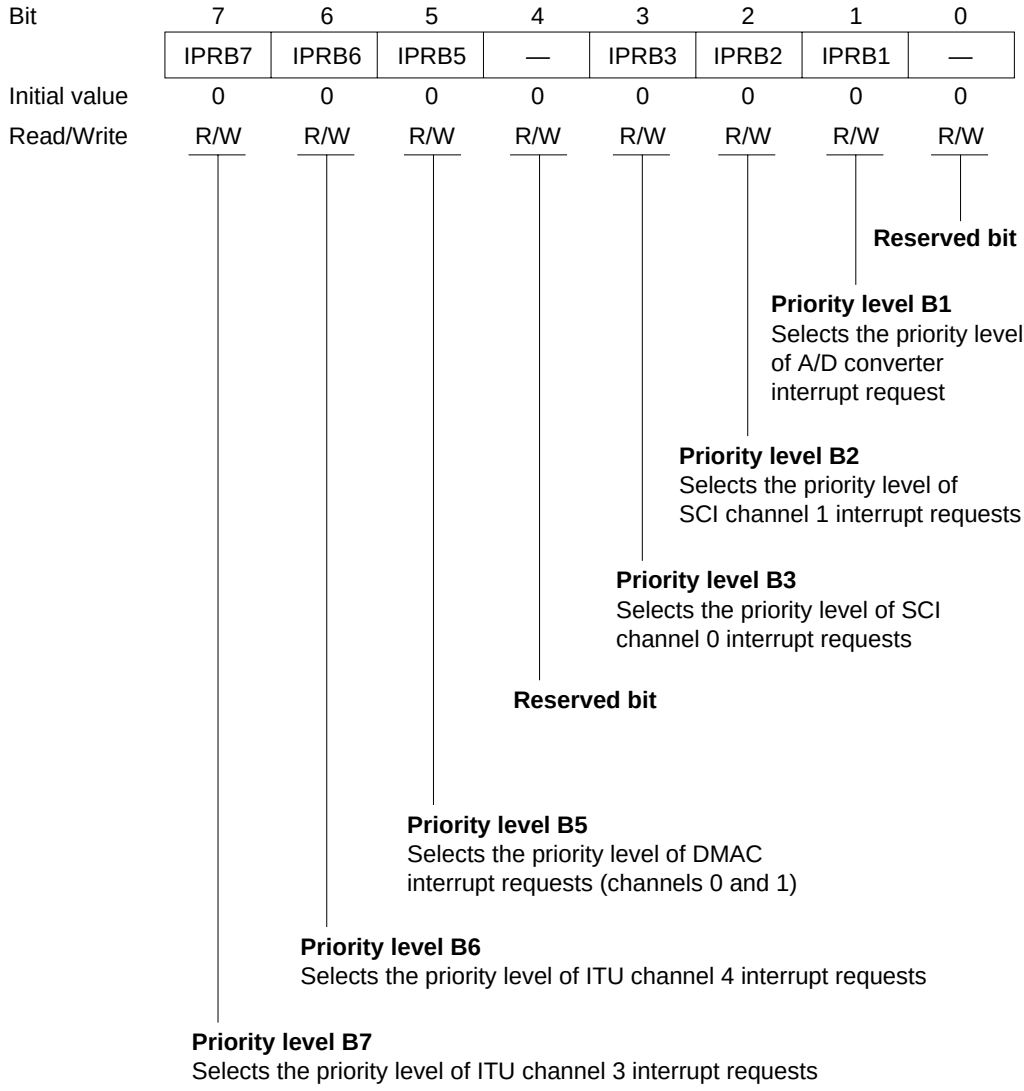
Bit 1—Priority Level A1 (IPRA1): Selects the priority level of ITU channel 1 interrupt requests.

Bit 1: IPRA1	Description
0	ITU channel 1 interrupt requests have priority level 0 (Non-priority) (Initial value)
1	ITU channel 1 interrupt requests have priority level 1 (Priority)

Bit 0—Priority Level A0 (IPRA0): Selects the priority level of ITU channel 2 interrupt requests.

Bit 0: IPRA0	Description
0	ITU channel 2 interrupt requests have priority level 0 (Non-priority) (Initial value)
1	ITU channel 2 interrupt requests have priority level 1 (Priority)

Interrupt Priority Register B (IPRB): IPRB is an 8-bit readable/writable register in which interrupt priority levels can be set.



IPRB is initialized to H'00 by a reset and in hardware standby mode.

Bit 7—Priority Level B7 (IPRB7): Selects the priority level of ITU channel 3 interrupt requests.

Bit 7: IPRB7	Description
0	ITU channel 3 interrupt requests have priority level 0 (low priority) (Initial value)
1	ITU channel 3 interrupt requests have priority level 1 (high priority)

Bit 6—Priority Level B6 (IPRB6): Selects the priority level of ITU channel 4 interrupt requests.

Bit 6: IPRB6	Description
0	ITU channel 4 interrupt requests have priority level 0 (low priority) (Initial value)
1	ITU channel 4 interrupt requests have priority level 1 (high priority)

Bit 5—Priority Level B5 (IPRB5): Selects the priority level of DMAC interrupt requests (channels 0 and 1).

Bit 5: IPRB5	Description
0	DMAC interrupt requests (channels 0 and 1) have priority level 0 (low priority) (Initial value)
1	DMAC interrupt requests (channels 0 and 1) have priority level 1 (high priority)

Bit 4—Reserved: This bit can be written and read, but it does not affect interrupt priority.

Bit 3—Priority Level B3 (IPRB3): Selects the priority level of SCI channel 0 interrupt requests.

Bit 3: IPRB3	Description
0	SCI0 interrupt requests have priority level 0 (low priority) (Initial value)
1	SCI0 interrupt requests have priority level 1 (high priority)

Bit 2—Priority Level B2 (IPRB2): Selects the priority level of SCI channel 1 interrupt requests.

Bit 2: IPRB2	Description
0	SCI1 interrupt requests have priority level 0 (low priority) (Initial value)
1	SCI1 interrupt requests have priority level 1 (high priority)

Bit 1—Priority Level B1 (IPRB1): Selects the priority level of A/D converter interrupt requests.

Bit 1: IPRB1	Description
0	A/D converter interrupt requests have priority level 0 (low priority) (Initial value)
1	A/D converter interrupt requests have priority level 1 (high priority)

Bit 0—Reserved: This bit can be written and read, but it does not affect interrupt priority.

5.2.3 IRQ Status Register (ISR)

ISR is an 8-bit readable/writable register that indicates the status of IRQ_0 to IRQ_5 interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value	0	0	0	0	0	0	0	0
Read/Write	—	—	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Reserved bits

IRQ_5 to IRQ_0 flags
These bits indicate IRQ_5 to IRQ_0 interrupt request status

Note: * Only 0 can be written, to clear flags.

ISR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: Read-only bits, always read as 0.

Bits 5 to 0—IRQ_5 to IRQ_0 Flags (IRQ5F to IRQ0F): These bits indicate the status of IRQ_5 to IRQ_0 interrupt requests.

Bits 5 to 0: IRQ5F to IRQ0F	Description
0	[Clearing conditions] (Initial value) • 0 is written in IRQnF after reading the IRQnF flag when IRQnF = 1. • IRQnSC = 0, $\overline{\text{IRQn}}$ input is high, and interrupt exception handling is carried out. • IRQnSC = 1 and IRQn interrupt exception handling is carried out.
1	[Setting conditions] • IRQnSC = 0 and $\overline{\text{IRQn}}$ input is low. • IRQnSC = 1 and a falling edge occurs in $\overline{\text{IRQn}}$ input

Note: n = 5 to 0

5.2.4 IRQ Enable Register (IER)

IER is an 8-bit readable/writable register that enables or disables IRQ_0 to IRQ_5 interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5E	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

IRQ_5 to IRQ_0 enable
These bits enable or disable IRQ_5 to IRQ_0 interrupts

IER is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: These bits can be written and read, but they do not enable or disable interrupts.

Bits 5 to 0—IRQ_5 to IRQ_0 Enable (IRQ5E to IRQ0E): These bits enable or disable

IRQ_5 to IRQ0 interrupts.

Bits 5 to 0:

IRQ5E to IRQ0E	Description	
0	IRQ_5 to IRQ_0 interrupts are disabled	(Initial value)
1	IRQ_5 to IRQ_0 interrupts are enabled	

5.2.5 IRQ Sense Control Register (ISCR)

ISCR is an 8-bit readable/writable register that selects level sensing or falling-edge sensing of the inputs at pins $\overline{IRQ}_5$ to $\overline{IRQ}_0$.

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5SC	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

IRQ_5 to IRQ_0 sense control
These bits select level sensing or falling-edge sensing for IRQ_5 to IRQ_0 interrupts

ISCR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 and 6—Reserved: These bits can be written and read, but they do not select level or falling-edge sensing.

Bits 5 to 0—IRQ_5 to IRQ_0 Sense Control (IRQ5SC to IRQ0SC): These bits select whether interrupts IRQ_5 to IRQ_0 are requested by level sensing of pins $\overline{IRQ}_5$ to $\overline{IRQ}_0$, or by falling-edge sensing.

Bits 5 to 0: IRQ5SC to IRQ0SC	Description	
0	Interrupts are requested when $\overline{IRQ}_5$ to $\overline{IRQ}_0$ inputs are low	(Initial value)
1	Interrupts are requested by falling-edge input at $\overline{IRQ}_5$ to $\overline{IRQ}_0$	

5.3 Interrupt Sources

The interrupt sources include external interrupts (NMI, IRQ_0 to IRQ_5) and 30 internal interrupts.

5.3.1 External Interrupts

There are seven external interrupts: NMI, and IRQ_0 to IRQ_5. Of these, NMI, IRQ_0, IRQ_1, and IRQ_2 can be used to exit software standby mode.

NMI: NMI is the highest-priority interrupt and is always accepted, regardless of the states of the I and UI bits in CCR. The NMIEG bit in SYSCR selects whether an interrupt is requested by the rising or falling edge of the input at the NMI pin. NMI interrupt exception handling has vector number 7.

IRQ_0 to IRQ_5 Interrupts: These interrupts are requested by input signals at pins $\overline{IRQ_0}$ to $\overline{IRQ_5}$. The IRQ_0 to IRQ_5 interrupts have the following features.

- ISCR settings can select whether an interrupt is requested by the low level of the input at pins $\overline{IRQ_0}$ to $\overline{IRQ_5}$, or by the falling edge.
- IER settings can enable or disable the IRQ_0 to IRQ_5 interrupts. Interrupt priority levels can be assigned by four bits in IPRA (IPRA7 to IPRA4).
- The status of IRQ_0 to IRQ_5 interrupt requests is indicated in ISR. The ISR flags can be cleared to 0 by software.

Figure 5.2 shows a block diagram of interrupts IRQ_0 to IRQ_5.

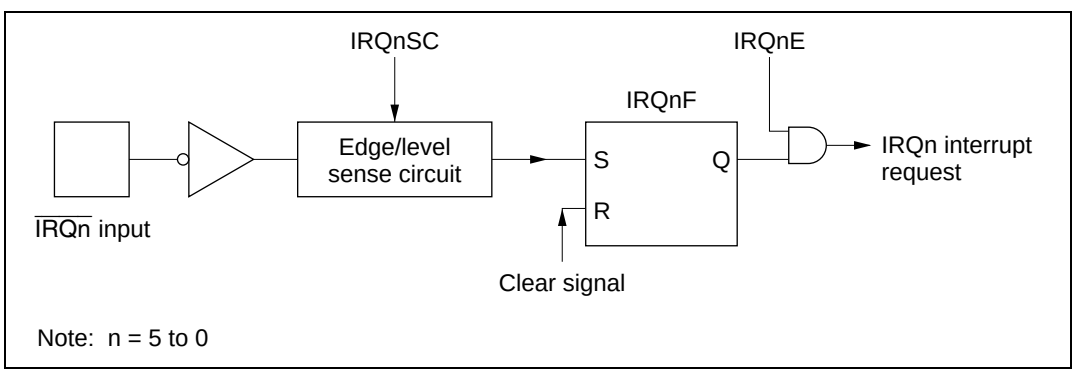


Figure 5.2 Block Diagram of Interrupts IRQ_0 to IRQ_5

Figure 5.3 shows the timing of the setting of the interrupt flags (IRQnF).

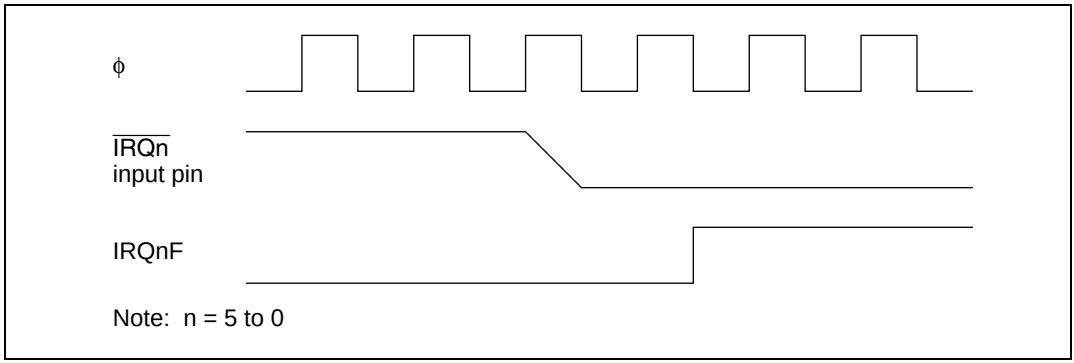

Figure 5.3 Timing of Setting of IRQnF

Interrupts IRQ_0 to IRQ_5 have vector numbers 12 to 17. These interrupts are detected regardless of whether the corresponding pin is set for input or output. When using a pin for external interrupt input, clear its DDR bit to 0 and do not use the pin for chip select output, refresh output, or SCI input or output.

5.3.2 Internal Interrupts

Thirty internal interrupts are requested from the on-chip supporting modules.

- Each on-chip supporting module has status flags for indicating interrupt status, and enable bits for enabling or disabling interrupts.
- Interrupt priority levels can be assigned in IPRA and IPRB.
- ITU and SCI interrupt requests can activate the DMAC, in which case no interrupt request is sent to the interrupt controller, and the I and UI bits are disregarded.

5.3.3 Interrupt Exception Vector Table

Table 5.3 lists the interrupt sources, their vector addresses, and their default priority order. In the default priority order, smaller vector numbers have higher priority. The priority of interrupts other than NMI can be changed in IPRA and IPRB. The priority order after a reset is the default order shown in table 5.3.

Table 5.3 Interrupt Sources, Vector Addresses, and Priority

Interrupt Source	Origin	Vector Number	Vector Address*	IPR	Priority
NMI	External pins	7	H'001C to H'001F	—	High
IRQ_0		12	H'0030 to H'0033	IPRA7	↑
IRQ_1		13	H'0034 to H0037	IPRA6	
IRQ_2		14	H'0038 to H'003B	IPRA5	
IRQ_3		15	H'003C to H'003F		
IRQ_4		16	H'0040 to H'0043	IPRA4	
IRQ_5		17	H'0044 to H'0047		
Reserved	—	18	H'0048 to H'004B		
		19	H'004C to H'004F		
WOVI (interval timer)	Watchdog timer	20	H'0050 to H'0053	IPRA3	
CMI (compare match)	Refresh controller	21	H'0054 to H'0057		
Reserved	—	22	H'0058 to H'005B		
		23	H'005C to H'005F

		49	H'00C4 to H'00C7		
		50	H'00C8 to H'00CB		
		51	H'00CC to H'00CF		
					Low

Interrupt Source	Origin	Vector Number	Vector Address*	IPR	Priority
ERI0 (receive error 0)	SCI channel 0	52	H'00D0 to H'00D3	IPRB3	High
RXI0 (receive data full 0)		53	H'00D4 to H'00D7		
TXI0 (transmit data empty 0)		54	H'00D8 to H'00DB		
TEI0 (transmit end 0)		55	H'00DC to H'00DF		
ERI1 (receive error 1)	SCI channel 1	56	H'00E0 to H'00E3	IPRB2	
RXI1 (receive data full 1)		57	H'00E4 to H'00E7		
TXI1 (transmit data empty 1)		58	H'00E8 to H'00EB		
TEI1 (transmit end 1)		59	H'00EC to H'00EF		
ADI (A/D end)	A/D	60	H'00F0 to H'00F3	IPRB1	Low

Note: * Lower 16 bits of the address.

5.4 Interrupt Operation

5.4.1 Interrupt Handling Process

The H8/3052BF handles interrupts differently depending on the setting of the UE bit. When UE = 1, interrupts are controlled by the I bit. When UE = 0, interrupts are controlled by the I and UI bits. Table 5.4 indicates how interrupts are handled for all setting combinations of the UE, I, and UI bits.

NMI interrupts are always accepted except in the reset and hardware standby states. IRQ interrupts and interrupts from the on-chip supporting modules have their own enable bits. Interrupt requests are ignored when the enable bits are cleared to 0.

Table 5.4 UE, I, and UI Bit Settings and Interrupt Handling

SYSCR	CCR		
UE	**I**	**UI**	**Description**
1	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	—	No interrupts are accepted except NMI.
0	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	0	NMI and interrupts with priority level 1 are accepted.
		1	No interrupts are accepted except NMI.

UE = 1: Interrupts IRQ_0 to IRQ_5 and interrupts from the on-chip supporting modules can all be masked by the I bit in the CPU's CCR. Interrupts are masked when the I bit is set to 1, and unmasked when the I bit is cleared to 0. Interrupts with priority level 1 have higher priority. Figure 5.4 is a flowchart showing how interrupts are accepted when UE = 1.

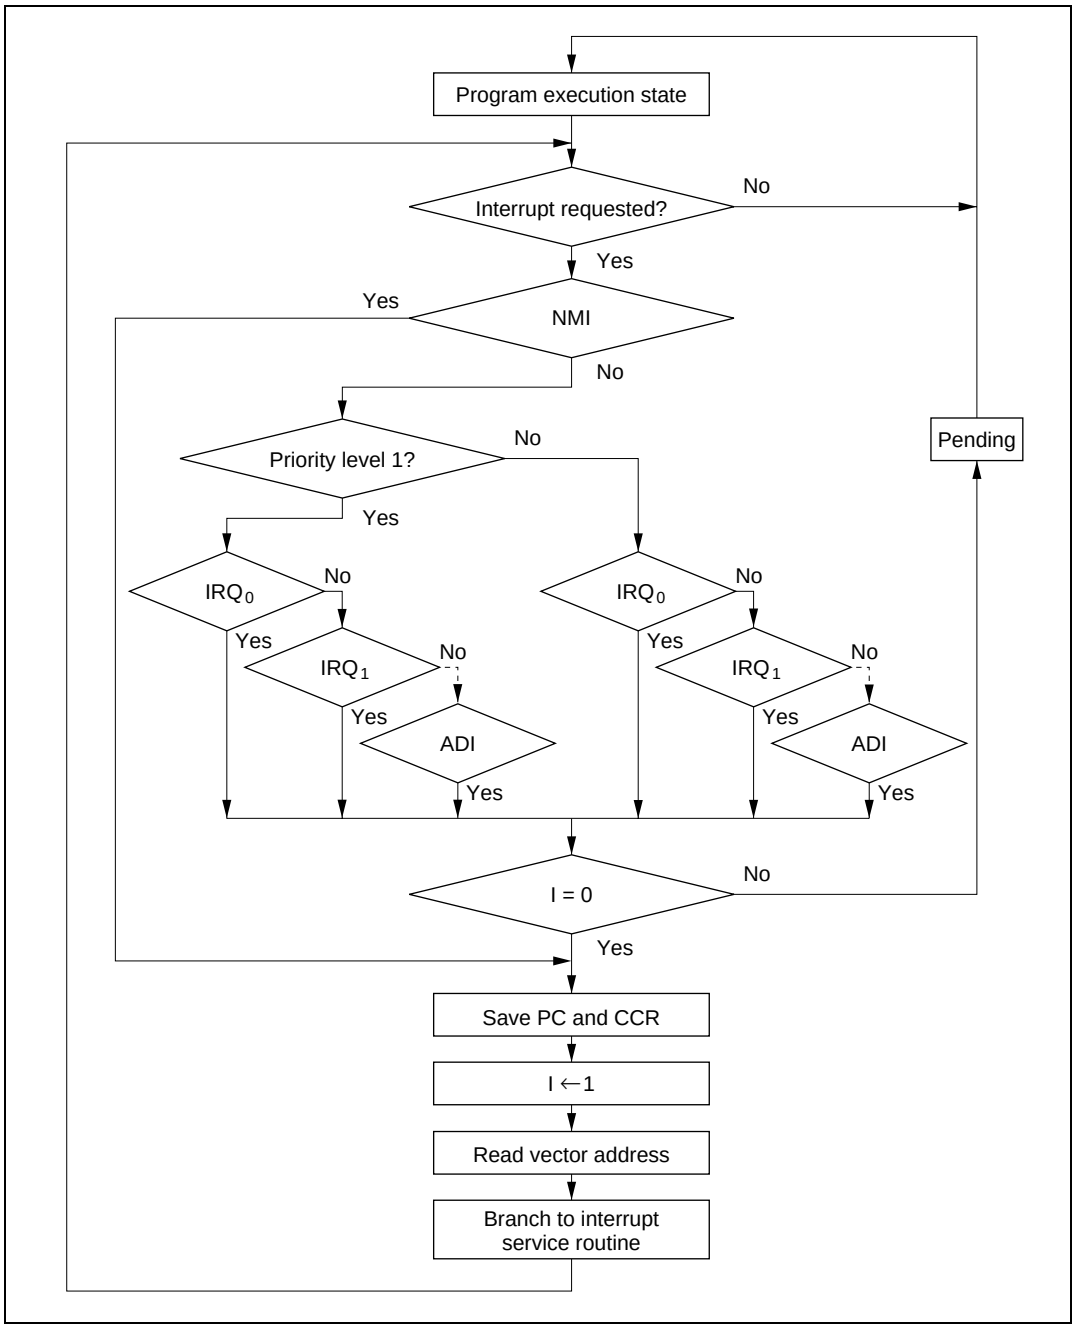

Figure 5.4 Process Up to Interrupt Acceptance when UE = 1

1. If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
2. When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5.3.
3. The interrupt controller checks the I bit. If the I bit is cleared to 0, the selected interrupt request is accepted. If the I bit is set to 1, only NMI is accepted; other interrupt requests are held pending.
4. When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
5. In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.
6. Next the I bit is set to 1 in CCR, masking all interrupts except NMI.
7. The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.

UE = 0: The I and UI bits in the CPU's CCR and the IPR bits enable three-level masking of IRQ_0 to IRQ_5 interrupts and interrupts from the on-chip supporting modules.

- Interrupt requests with priority level 0 are enabled when the I bit is cleared to 0, and disabled when the I bit is set to 1.
- Interrupt requests with priority level 1 are enabled when the I bit or UI bit is cleared to 0, and disabled when the I bit and UI bit are both set to 1.

  For example, if the interrupt enable bits of all interrupt requests are set to 1, and IPRA and IPRB are set to H'20 and H'00, respectively (giving IRQ_2 and IRQ_3 interrupt requests priority over other interrupts), interrupts are enabled and disabled as follows:

  a. If I = 0, all interrupts are enabled (priority order: NMI > IRQ_2 > IRQ_3 > IRQ_0 ...).
  b. If I = 1 and UI = 0, only NMI, IRQ_2, and IRQ_3 are enabled.
  c. If I = 1 and UI = 1, all interrupts are disabled except NMI.

Figure 5.5 shows the transitions among the above states.

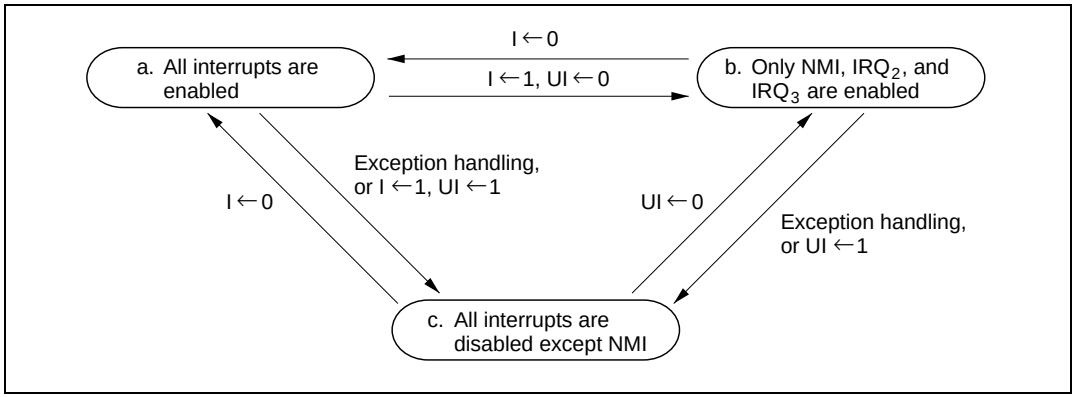

Figure 5.5 Interrupt Enable/Disable State Transitions (Example)

Figure 5.6 is a flowchart showing how interrupts are accepted when UE = 0.

1. If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
2. When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5.3.
3. The interrupt controller checks the I bit. If the I bit is cleared to 0, the interrupt request is accepted regardless of its IPR setting. The value of the UI bit is immaterial. If the I bit is set to 1 and the UI bit is cleared to 0, only interrupt requests with priority level 1 are accepted; interrupt requests with priority level 0 are held pending. If the I bit and UI bit are both set to 1, the interrupt request is held pending.
4. When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
5. In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.
6. The I and UI bits are set to 1 in CCR, masking all interrupts except NMI.
7. The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.

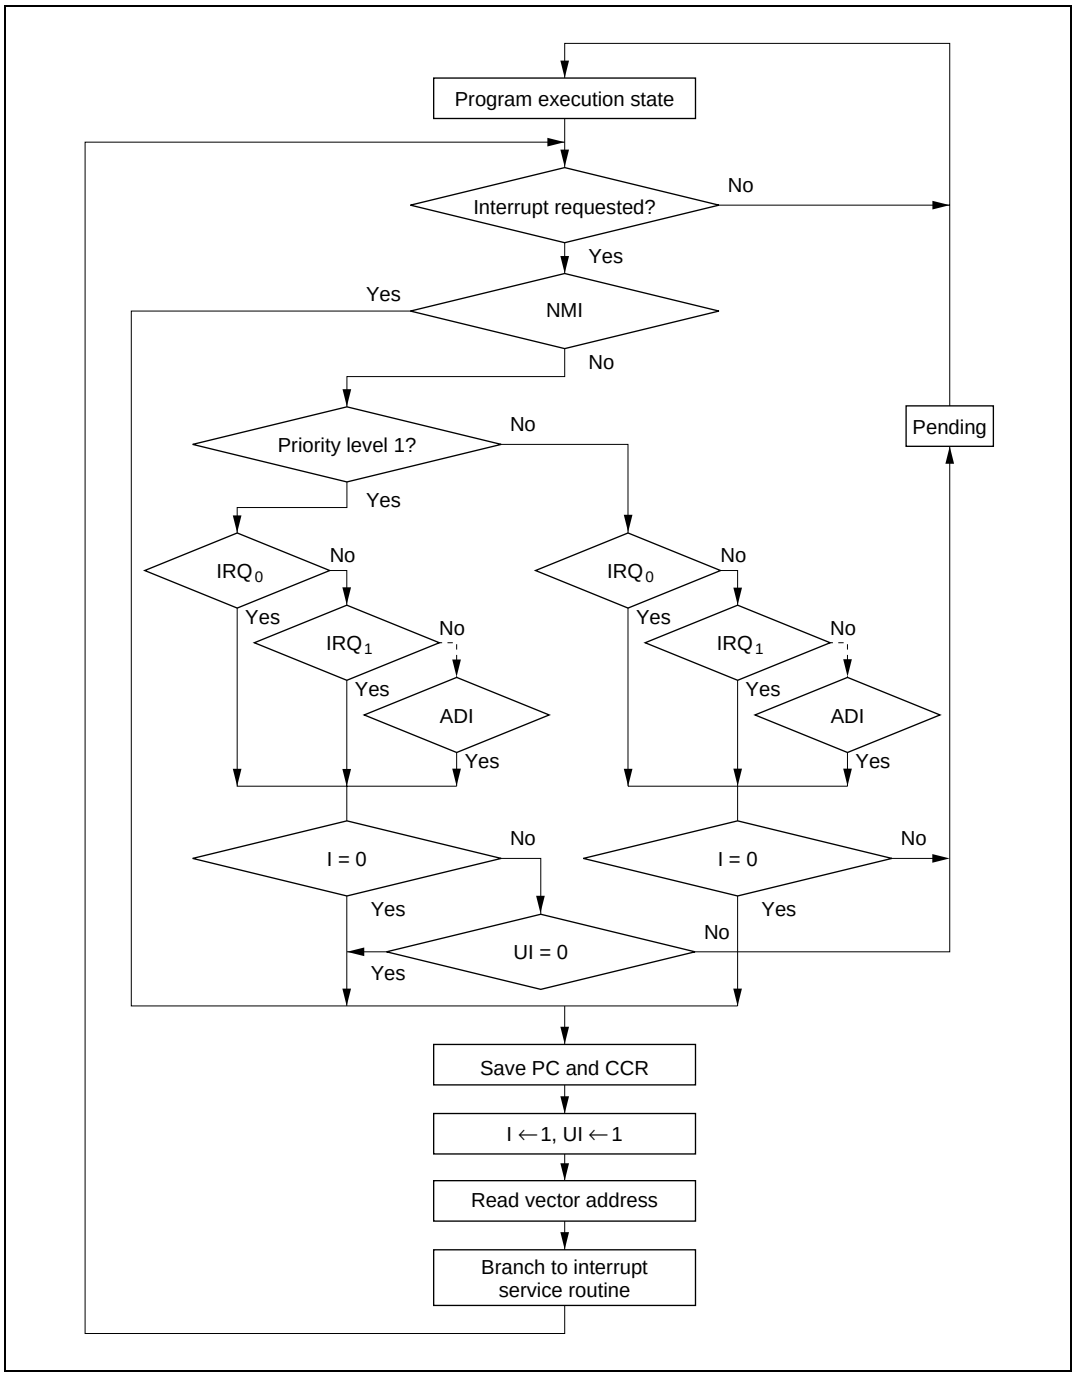

Figure 5.6 Process Up to Interrupt Acceptance when UE = 0

5.4.2 Interrupt Exception Handling Sequence

Figure 5.7 shows the interrupt sequence in mode 2 when the program area and stack area are in 16-bit, two-state access space in external memory.

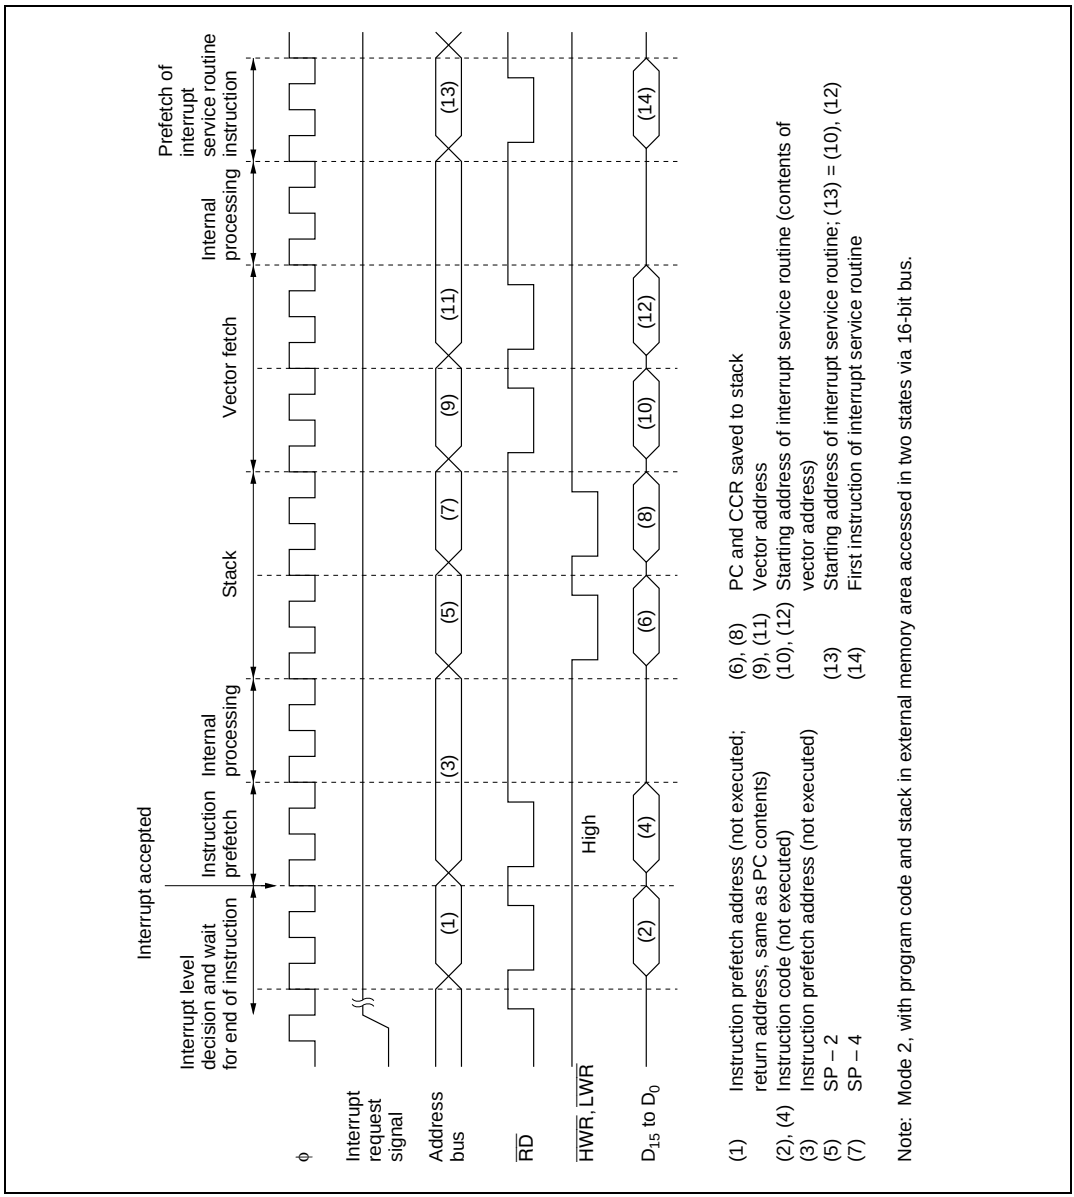

Figure 5.7 Interrupt Sequence (Mode 2, Two-State Access, Stack in External Memory)

5.4.3 Interrupt Response Time

Table 5.5 indicates the interrupt response time from the occurrence of an interrupt request until the first instruction of the interrupt service routine is executed.

Table 5.5 Interrupt Response Time

			External Memory			
			8-Bit Bus		16-Bit Bus	
No.	Item	On-Chip Memory	2 States	3 States	2 States	3 States
1	Interrupt priority decision	2*1	2*1	2*1	2*1	2*1
2	Maximum number of states until end of current instruction	1 to 23	1 to 27	1 to 31*4	1 to 23	1 to 25*4
3	Saving PC and CCR to stack	4	8	12*4	4	6*4
4	Vector fetch	4	8	12*4	4	6*4
5	Instruction prefetch*2	4	8	12*4	4	6*4
6	Internal processing*3	4	4	4	4	4
Total		19 to 41	31 to 57	43 to 73	19 to 41	25 to 49

Notes: 1. 1 state for internal interrupts.
2. Prefetch after the interrupt is accepted and prefetch of the first instruction in the interrupt service routine.
3. Internal processing after the interrupt is accepted and internal processing after prefetch.
4. The number of states increases if wait states are inserted in external memory access.

5.5 Usage Notes

5.5.1 Contention between Interrupt Generation and Disabling

When an instruction clears an interrupt enable bit to 0 to disable the interrupt, the interrupt is not actually disabled until after execution of the instruction is completed. Thus, if an interrupt occurs while a BCLR, MOV, or other instruction is being executed to clear its interrupt enable bit to 0, at the instant when execution of the instruction ends the interrupt is still enabled, so its interrupt exception handling is carried out. If a higher-priority interrupt is also requested, however, interrupt exception handling for the higher-priority interrupt is carried out, and the lower-priority interrupt is ignored. This also applies when an interrupt source flag is cleared to 0.

Figure 5.8 shows an example in which an IMIEA bit is cleared to 0 in TIER of the ITU.

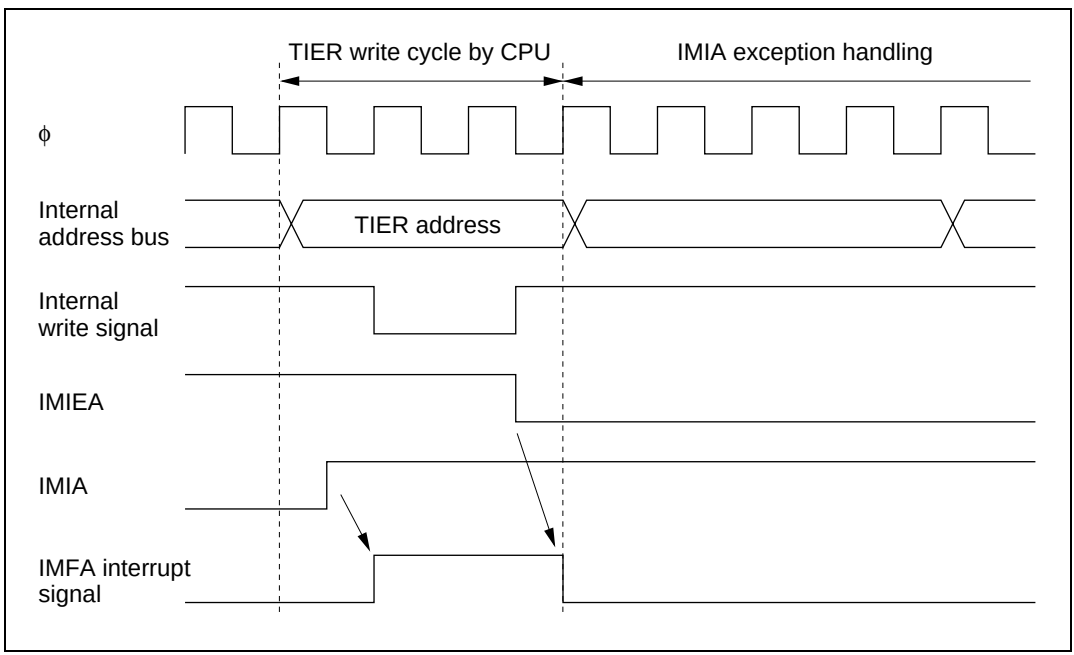

Figure 5.8 Contention between Interrupt and Interrupt-Disabling Instruction

This type of contention will not occur if the interrupt is masked when the interrupt enable bit or flag is cleared to 0.

5.5.2 Instructions that Inhibit Interrupts

The LDC, ANDC, ORC, and XORC instructions inhibit interrupts. When an interrupt occurs, after determining the interrupt priority, the interrupt controller requests a CPU interrupt. If the CPU is currently executing one of these interrupt-inhibiting instructions, however, when the instruction is completed the CPU always continues by executing the next instruction.

5.5.3 Interrupts during EEPMOV Instruction Execution

The EEPMOV.B and EEPMOV.W instructions differ in their reaction to interrupt requests.

When the EEPMOV.B instruction is executing a transfer, no interrupts are accepted until the transfer is completed, not even NMI.

When the EEPMOV.W instruction is executing a transfer, interrupt requests other than NMI are not accepted until the transfer is completed. If NMI is requested, NMI exception handling starts at a transfer cycle boundary. The PC value saved on the stack is the address of the next instruction. Programs should be coded as follows to allow for NMI interrupts during EEPMOV.W execution:

```
L1: EEPMOV.W
    MOV.W R4,R4
    BNE  L1
```

5.5.4 Notes on Use of External Interrupts

The specifications provide for the IRQnF flag to be cleared by first reading the flag while it is set to 1, then writing 0 to it. However, there are cases in which the IRQnF flag is erroneously cleared, preventing execution of interrupt exception handling, simply by writing 0 to the flag, without first reading 1 from it. This occurs when the following conditions are fulfilled.

Setting Conditions

1. When using multiple external interrupts (IRQa, IRQb)
2. When different clearing methods are used for the IRQaF flag and IRQbF flag, with the IRQaF flag cleared by writing 0 to it, and the IRQbF flag cleared by hardware.
3. IRQaF flag clears and bit operation command is being used for the IRQ status register (ISR) or the ISR is being read in bytes; IRQaF flag's bits clear and other bit values read in bits are written in bytes.

Occurrence Conditions

1. If an ISR register read is executed to clear the IRQaF flag while IRQaF = 1, and then the IRQbF flag is cleared by the initiation of interrupt exception handling.
2. If there is contention between IRQaF flag clearing and IRQbF generation (IRQaF flag setting) (when IRQbF = 0 at the time of the ISR read to clear the IRQaF flag, but IRQbF is set to 1 before the write to ISR).

If above setting conditions 1 to 3 and occurrence conditions 1 and 2 are all fulfilled, IRQbF will be cleared erroneously when the ISR write in occurrence condition 2 is executed, and so interrupt exception handling will not be carried out.

However, the IRQbF flag will not be cleared erroneously if 0 is written to it at least once between occurrence conditions 1 and 2.

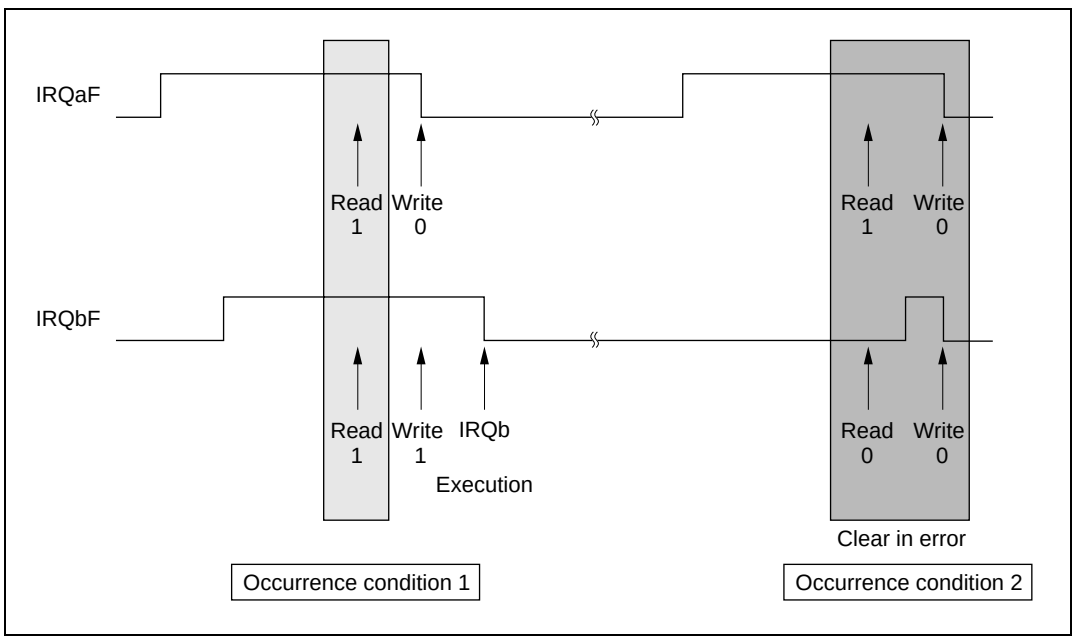

Figure 5.9 IRQnF Flag when Interrupt Processing Is Not Conducted

Either of the following methods can be used to prevent this problem.

- Solution 1

  When IRQaF flag clears, do not use the bit computation command, read the ISR in bytes. When IRQaF only is 0 write all other bits as 1 in bytes.

  For example, if a = 0

```
MOV.B @ISR,R0L
MOV.B #HFE,R0L
MOV.B R0L,@ISR
```

- Solution 2

  During IRQb interrupt processing, carry out IRQbF flag clear dummy processing.

  For example, if b = 1

```
IRQB  MOV.B #HFD,R0L
      MOV.B R0L,@ISR
            .
            .
            .
```

Section 6 Bus Controller

6.1 Overview

The H8/3052BF has an on-chip bus controller that divides the address space into eight areas and can assign different bus specifications to each. This enables different types of memory to be connected easily.

A bus arbitration function of the bus controller controls the operation of the DMA controller (DMAC) and refresh controller. The bus controller can also release the bus to an external device.

6.1.1 Features

Features of the bus controller are listed below.

- Independent settings for address areas 0 to 7
  - 128-kbyte areas in 1-Mbyte modes; 2-Mbyte areas in 16-Mbyte modes.
  - Chip select signals ($\overline{CS}_0$ to $\overline{CS}_7$) can be output for areas 0 to 7.
  - Areas can be designated for 8-bit or 16-bit access.
  - Areas can be designated for two-state or three-state access.
- Four wait modes
  - Programmable wait mode, pin auto-wait mode, and pin wait modes 0 and 1 can be selected.
  - Zero to three wait states can be inserted automatically.
- Bus arbitration function
  - A built-in bus arbiter grants the bus right to the CPU, DMAC, refresh controller, or an external bus master.

6.1.2 Block Diagram

Figure 6.1 shows a block diagram of the bus controller.

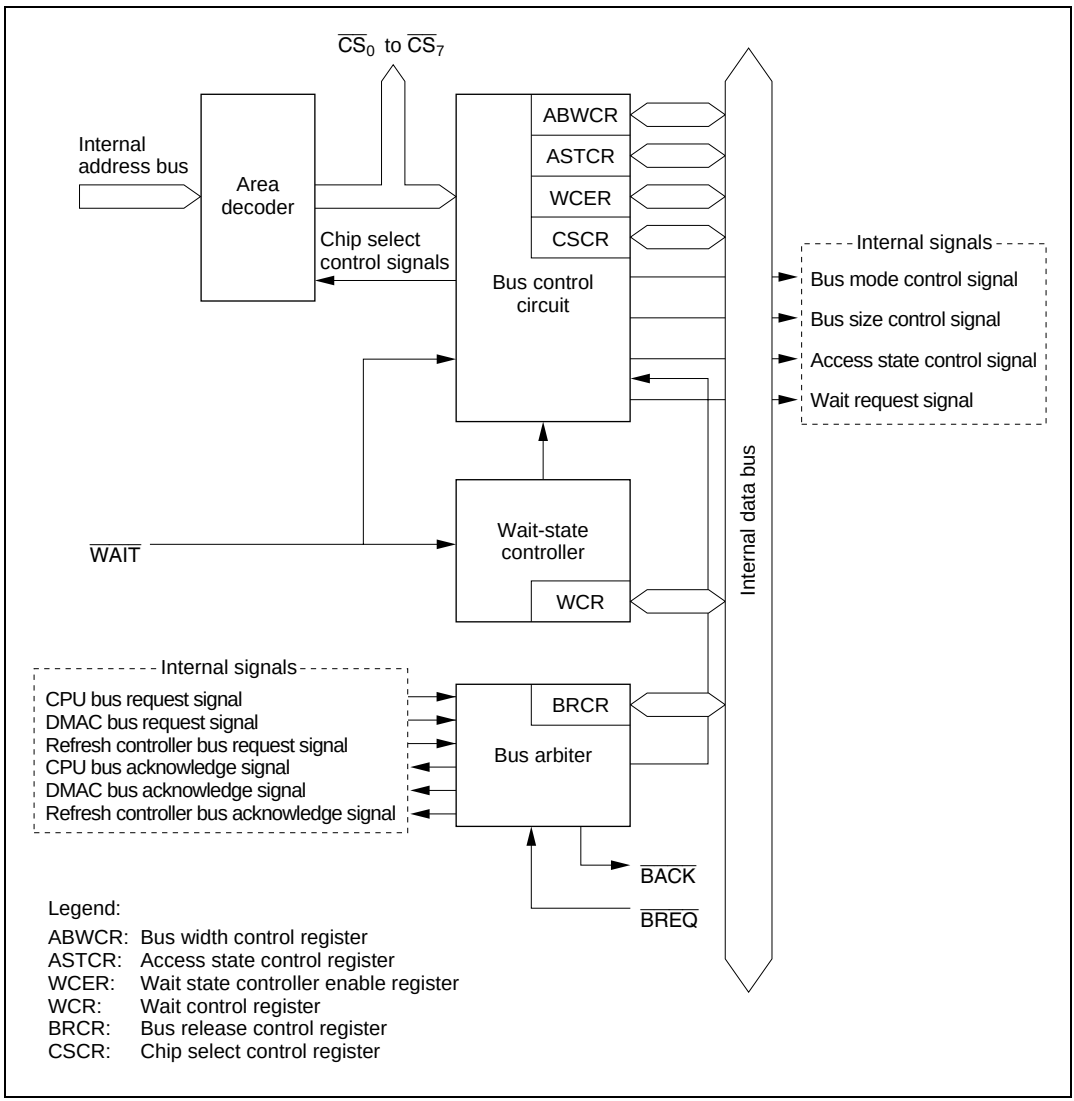

Figure 6.1 Block Diagram of Bus Controller

6.1.3 Pin Configuration

Table 6.1 summarizes the bus controller's input/output pins.

Table 6.1 Bus Controller Pins

Name	Abbreviation	I/O	Function
Chip select 0 to 7	$\overline{CS_0}$ to $\overline{CS_7}$	Output	Strobe signals selecting areas 0 to 7
Address strobe	$\overline{AS}$	Output	Strobe signal indicating valid address output on the address bus
Read	$\overline{RD}$	Output	Strobe signal indicating reading from the external address space
High write	$\overline{HWR}$	Output	Strobe signal indicating writing to the external address space, with valid data on the upper data bus (D_{15} to D_8)
Low write	$\overline{LWR}$	Output	Strobe signal indicating writing to the external address space, with valid data on the lower data bus (D_7 to D_0)
Wait	$\overline{WAIT}$	Input	Wait request signal for access to external three-state-access areas
Bus request	$\overline{BREQ}$	Input	Request signal for releasing the bus to an external device
Bus acknowledge	$\overline{BACK}$	Output	Acknowledge signal indicating the bus is released to an external device

6.1.4 Register Configuration

Table 6.2 summarizes the bus controller's registers.

Table 6.2 Bus Controller Registers

				Initial Value	
Address*	**Name**	**Abbreviation**	**R/W**	**Modes 1, 3, 5, 6**	**Modes 2, 4, 7**
H'FFEC	Bus width control register	ABWCR	R/W	H'FF	H'00
H'FFED	Access state control register	ASTCR	R/W	H'FF	H'FF
H'FFEE	Wait control register	WCR	R/W	H'F3	H'F3
H'FFEF	Wait state controller enable register	WCER	R/W	H'FF	H'FF
H'FFF3	Bus release control register	BRCR	R/W	H'FE	H'FE
H'FF5F	Chip select control register	CSCR	R/W	H'0F	H'0F

Note: * Lower 16 bits of the address.

6.2 Register Descriptions

6.2.1 Bus Width Control Register (ABWCR)

ABWCR is an 8-bit readable/writable register that selects 8-bit or 16-bit access for each area.

Bit		7	6	5	4	3	2	1	0
		ABW7	ABW6	ABW5	ABW4	ABW3	ABW2	ABW1	ABW0
Initial value	Modes 1, 3, 5, 6, 7	1	1	1	1	1	1	1	1
	Modes 2, 4	0	0	0	0	0	0	0	0
Read/Write		R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits selecting bus width for each area

When ABWCR contains H'FF (selecting 8-bit access for all areas), the chip operates in 8-bit bus mode: the upper data bus (D_{15} to D_8) is valid, and port 4 is an input/output port. When at least one bit is cleared to 0 in ABWCR, the chip operates in 16-bit bus mode with a 16-bit data bus (D_{15} to D_0). In modes 1, 3, 5, 6, and 7 ABWCR is initialized to H'FF by a reset and in hardware standby mode. In modes 2 and 4 ABWCR is initialized to H'00 by a reset and in hardware standby mode. ABWCR is not initialized in software standby mode.

Bits 7 to 0—Area 7 to 0 Bus Width Control (ABW7 to ABW0): These bits select 8-bit access or 16-bit access to the corresponding address areas.

Bits 7 to 0: ABW7 to ABW0	Description
0	Areas 7 to 0 are 16-bit access areas
1	Areas 7 to 0 are 8-bit access areas

ABWCR specifies the bus width of external memory areas. The bus width of on-chip memory and registers is fixed and does not depend on ABWCR settings. These settings are therefore meaningless in single-chip mode (mode 7).

6.2.2 Access State Control Register (ASTCR)

ASTCR is an 8-bit readable/writable register that selects whether each area is accessed in two states or three states.

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits selecting number of states for access to each area

ASTCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

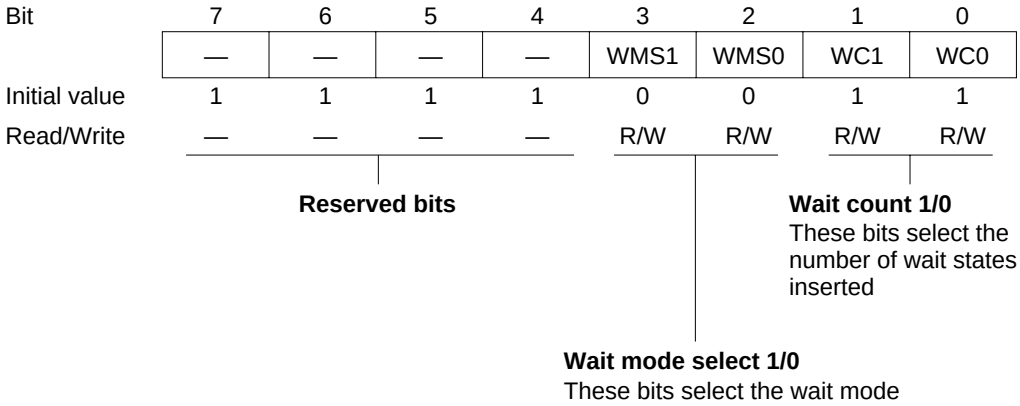
Bits 7 to 0—Area 7 to 0 Access State Control (AST7 to AST0): These bits select whether the corresponding area is accessed in two or three states.

Bits 7 to 0: AST7 to AST0	Description	
0	Areas 7 to 0 are accessed in two states	
1	Areas 7 to 0 are accessed in three states	(Initial value)

ASTCR specifies the number of states in which external areas are accessed. On-chip memory and registers are accessed in a fixed number of states that does not depend on ASTCR settings. These settings are therefore meaningless in single-chip mode (mode 7).

6.2.3 Wait Control Register (WCR)

WCR is an 8-bit readable/writable register that selects the wait mode for the wait-state controller (WSC) and specifies the number of wait states.



WCR is initialized to H'F3 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bits 3 and 2—Wait Mode Select 1 and 0 (WMS1/0): These bits select the wait mode.

Bit 3: WMS1	Bit 2: WMS0	Description
0	0	Programmable wait mode (Initial value)
	1	No wait states inserted by wait-state controller
1	0	Pin wait mode 1
	1	Pin auto-wait mode

Bits 1 and 0—Wait Count 1 and 0 (WC1/0): These bits select the number of wait states inserted in access to external three-state-access areas.

Bit 1: WC1	Bit 0: WC0	Description
0	0	No wait states inserted by wait-state controller
	1	1 state inserted
1	0	2 states inserted
	1	3 states inserted (Initial value)

6.2.4 Wait State Controller Enable Register (WCER)

WCER is an 8-bit readable/writable register that enables or disables wait-state control of external three-state-access areas by the wait-state controller.

Bit	7	6	5	4	3	2	1	0
	WCE7	WCE6	WCE5	WCE4	WCE3	WCE2	WCE1	WCE0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Wait-state controller enable 7 to 0
These bits enable or disable wait-state control

WCER is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

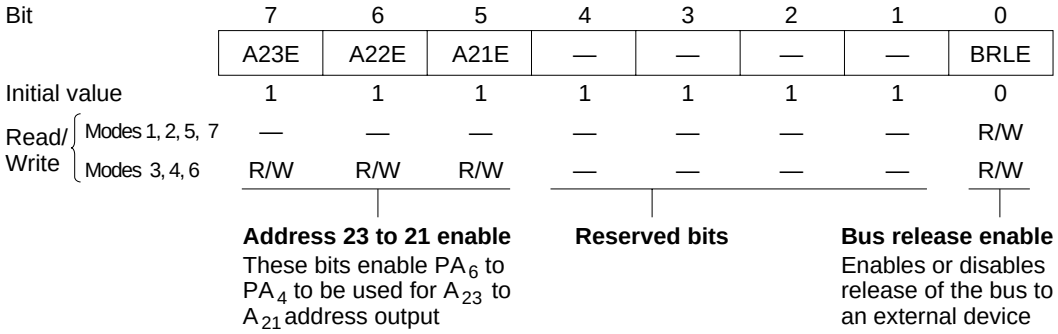
Bits 7 to 0—Wait-State Controller Enable 7 to 0 (WCE7 to WCE0): These bits enable or disable wait-state control of external three-state-access areas.

Bits 7 to 0: WCE7 to WCE0	Description	
0	Wait-state control disabled (pin wait mode 0)	
1	Wait-state control enabled	(Initial value)

Since WCER enables or disables wait-state control of external three-state-access areas, these settings are meaningless in single-chip mode (mode 7).

6.2.5 Bus Release Control Register (BRCR)

BRCR is an 8-bit readable/writable register that enables address output on bus lines A_{23} to A_{21} and enables or disables release of the bus to an external device.



BRCR is initialized to H'FE by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Address 23 Enable (A23E): Enables PA_4 to be used as the A_{23} address output pin. Writing 0 in this bit enables A_{23} address output from PA_4. In modes other than 3, 4, and 6 this bit cannot be modified and PA_4 has its ordinary input/output functions.

Bit 7: A23E	Description	
0	PA_4 is the A_{23} address output pin	
1	PA_4 is the $PA_4/TP_4/TIOCA_1$ input/output pin	(Initial value)

Bit 6—Address 22 Enable (A22E): Enables PA_5 to be used as the A_{22} address output pin. Writing 0 in this bit enables A_{22} address output from PA_5. In modes other than 3, 4, and 6 this bit cannot be modified and PA_5 has its ordinary input/output functions.

Bit 6: A22E	Description	
0	PA_5 is the A_{22} address output pin	
1	PA_5 is the $PA_5/TP_5/TIOCB_1$ input/output pin	(Initial value)

Bit 5—Address 21 Enable (A21E): Enables PA_6 to be used as the A_{21} address output pin. Writing 0 in this bit enables A_{21} address output from PA_6. In modes other than 3, 4, and 6 this bit cannot be modified and PA_6 has its ordinary input/output functions.

Bit 5: A21E	Description
0	PA_6 is the A_{21} address output pin
1	PA_6 is the $PA_6/TP_6/TIOCA_2$ input/output pin (Initial value)

Bits 4 to 1—Reserved: Read-only bits, always read as 1.

Bit 0—Bus Release Enable (BRLE): Enables or disables release of the bus to an external device.

Bit 0: BRLE	Description
0	The bus cannot be released to an external device; $\overline{BREQ}$ and $\overline{BACK}$ can be used as input/output pins (Initial value)
1	The bus can be released to an external device

6.2.6 Chip Select Control Register (CSCR)

CSCR is an 8-bit readable/writable register that enables or disables output of chip select signals ($\overline{CS}_7$ to $\overline{CS}_4$).

If a chip select signal ($\overline{CS}_7$ to $\overline{CS}_4$) output is selected in this register, the corresponding pin functions as a chip select signal ($\overline{CS}_7$ to $\overline{CS}_4$) output, this function taking priority over other functions. CSCR cannot be modified in single-chip mode.

Bit	7	6	5	4	3	2	1	0
	CS7E	CS6E	CS5E	CS4E	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Chip select 7 to 4 enable
These bits enable or disable chip select signal output

Reserved bits

CSCR is initialized to H'0F by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Chip Select 7 to 4 Enable (CS7E to CS4E): These bits enable or disable output of the corresponding chip select signal.

Bit n: CSnE	Description	
0	Output of chip select signal CS_n is disabled	(Initial value)
1	Output of chip select signal CS_n is enabled	

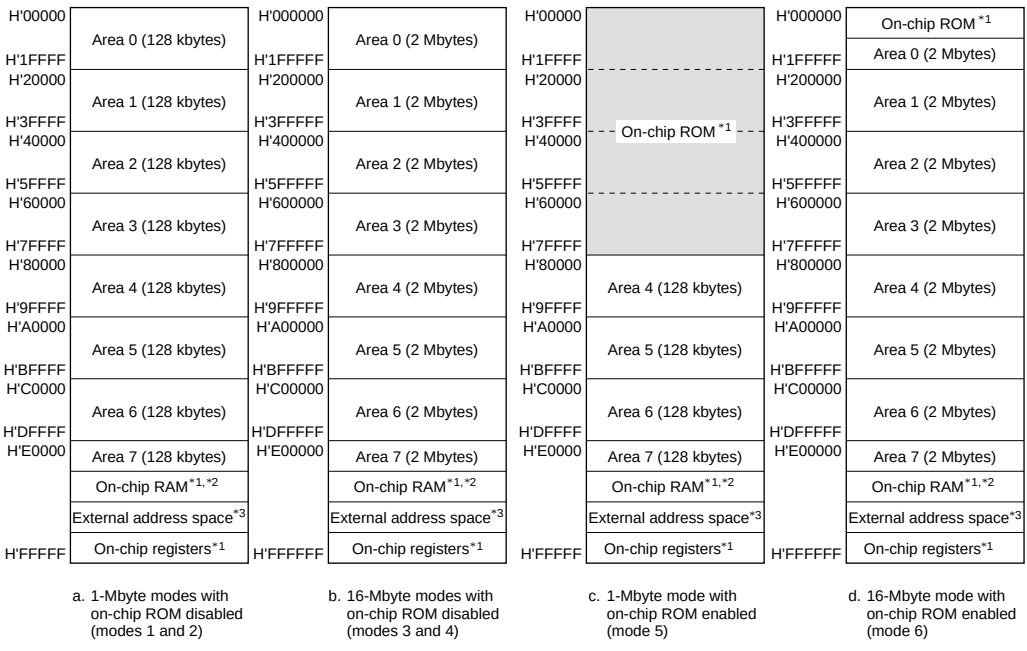
Note: n = 7 to 4

Bits 3 to 0—Reserved: Read-only bits, always read as 1.

6.3 Operation

6.3.1 Area Division

The external address space is divided into areas 0 to 7. Each area has a size of 128 kbytes in the 1-Mbyte modes, or 2 Mbytes in the 16-Mbyte modes. Figure 6.2 shows a general view of the memory map.



a. 1-Mbyte modes with on-chip ROM disabled (modes 1 and 2)

b. 16-Mbyte modes with on-chip ROM disabled (modes 3 and 4)

c. 1-Mbyte mode with on-chip ROM enabled (mode 5)

d. 16-Mbyte mode with on-chip ROM enabled (mode 6)

Notes: 1. The on-chip ROM, on-chip RAM, and on-chip registers have a fixed bus width and are accessed in a fixed number of states.
2. When the RAME bit is cleared to 0 in SYSCR, this area conforms to the specifications of area 7.
3. This external address area conforms to the specifications of area 7.

Figure 6.2 Access Area Map for Modes 1 to 6

Chip select signals ($\overline{CS}_7$ to $\overline{CS}_0$) can be output for areas 7 to 0. The bus specifications for each area can be selected in ABWCR, ASTCR, WCER, and WCR as shown in table 6.3.

Table 6.3 Bus Specifications

ABWCR	ASTCR	WCER	WCR		Bus Specifications		
ABWn	ASTn	WCEn	WMS1	WMS0	Bus Width	Access States	Wait Mode
0	0	—	—	—	16	2	Disabled
	1	0	—	—	16	3	Pin wait mode 0
		1	0	0	16	3	Programmable wait mode
				1	16	3	Disabled
			1	0	16	3	Pin wait mode 1
				1	16	3	Pin auto-wait mode
1	0	—	—	—	8	2	Disabled
	1	0	—	—	8	3	Pin wait mode 0
		1	0	0	8	3	Programmable wait mode
				1	8	3	Disabled
			1	0	8	3	Pin wait mode 1
				1	8	3	Pin auto-wait mode

Note: n = 7 to 0

6.3.2 Chip Select Signals

For each of areas 7 to 0, the H8/3052BF can output a chip select signal ($\overline{CS}_7$ to $\overline{CS}_0$) that goes low to indicate when the area is selected. Figure 6.3 shows the output timing of a $\overline{CS}_n$ signal (n = 7 to 0).

Output of $\overline{CS}_3$ to $\overline{CS}_0$: Output of $\overline{CS}_3$ to $\overline{CS}_0$ is enabled or disabled in the data direction register (DDR) of the corresponding port.

In the expanded modes with on-chip ROM disabled, a reset leaves pin $\overline{CS}_0$ in the output state and pins $\overline{CS}_3$ to $\overline{CS}_1$ in the input state. To output chip select signals $\overline{CS}_3$, to $\overline{CS}_1$ the corresponding DDR bits must be set to 1. In the expanded modes with on-chip ROM enabled, a reset leaves pins $\overline{CS}_3$ to $\overline{CS}_0$ in the input state. To output chip select signals $\overline{CS}_3$, to $\overline{CS}_0$ the corresponding DDR bits must be set to 1. For details see section 9, I/O Ports.

Output of $\overline{CS}_7$ to $\overline{CS}_4$: Output of $\overline{CS}_7$ to $\overline{CS}_4$ is enabled or disabled in the chip select control register (CSCR). A reset leaves pins $\overline{CS}_7$ to $\overline{CS}_4$ in the input state. To output chip select signals $\overline{CS}_7$ to $\overline{CS}_4$, the corresponding CSCR bits must be set to 1. For details see section 9, I/O Ports.

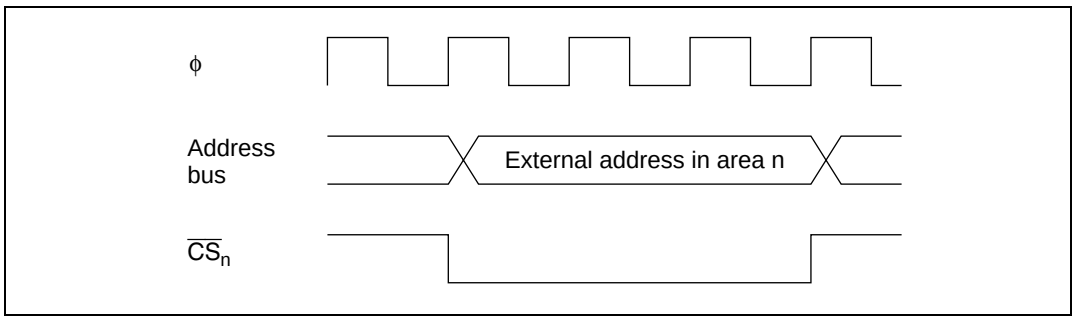


Figure 6.3 $\overline{CS}_n$ Output Timing (n = 7 to 0)

When the on-chip ROM, on-chip RAM, and on-chip registers are accessed, $\overline{CS}_7$ and $\overline{CS}_0$ remain high. The $\overline{CS}_n$ signals are decoded from the address signals. They can be used as chip select signals for SRAM and other devices.

6.3.3 Data Bus

The H8/3052BF allows either 8-bit access or 16-bit access to be designated for each of areas 0 to 7. An 8-bit-access area uses the upper data bus (D_{15} to D_8). A 16-bit-access area uses both the upper data bus (D_{15} to D_8) and lower data bus (D_7 to D_0).

In read access the $\overline{RD}$ signal applies without distinction to both the upper and lower data bus. In write access the $\overline{HWR}$ signal applies to the upper data bus, and the $\overline{LWR}$ signal applies to the lower data bus.

Table 6.4 indicates how the two parts of the data bus are used under different access conditions.

Table 6.4 Access Conditions and Data Bus Usage

Area	Access Size	Read /Write	Address	Valid Strobe	Upper Data Bus (D_{15} to D_8)	Lower Data Bus (D_7 to D_0)
8-bit-access area	—	Read	—	$\overline{RD}$	Valid	Invalid
		Write	—	$\overline{HWR}$		Undetermined data
16-bit-access area	Byte	Read	Even	$\overline{RD}$	Valid	Invalid
			Odd		Invalid	Valid
		Write	Even	$\overline{HWR}$	Valid	Undetermined data
			Odd	$\overline{LWR}$	Undetermined data	Valid
	Word	Read	—	$\overline{RD}$	Valid	Valid
		Write	—	$\overline{HWR}$, $\overline{LWR}$	Valid	Valid

Note: Undetermined data means that unpredictable data is output.
Invalid means that the bus is in the input state and the input is ignored.

6.3.4 Bus Control Signal Timing

8-Bit, Three-State-Access Areas: Figure 6.4 shows the timing of bus control signals for an 8-bit, three-state-access area. The upper address bus (D_{15} to D_8) is used to access these areas. The $\overline{LWR}$ pin is always high. Wait states can be inserted.

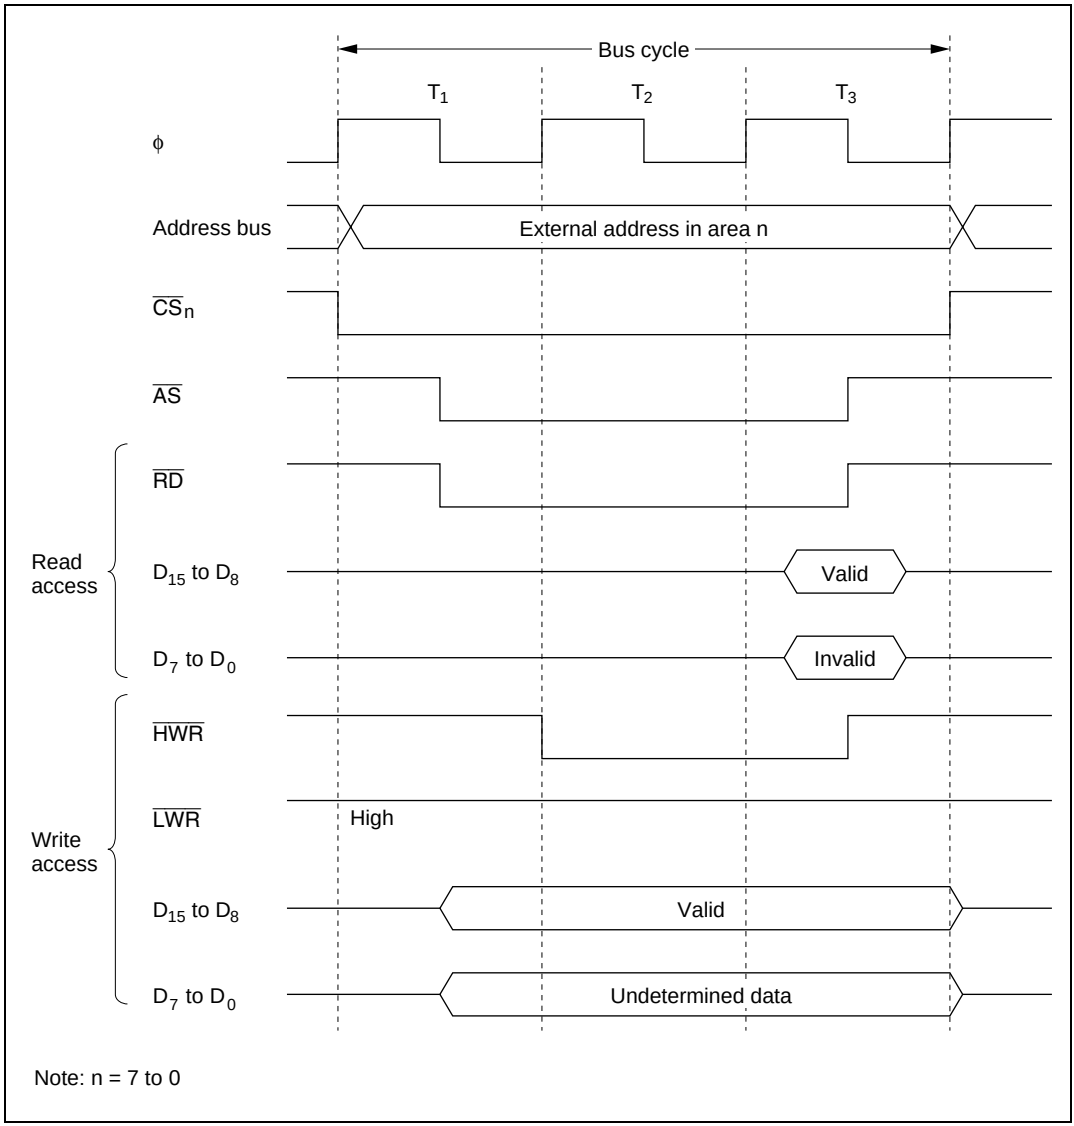

Figure 6.4 Bus Control Signal Timing for 8-Bit, Three-State-Access Area

8-Bit, Two-State-Access Areas: Figure 6.5 shows the timing of bus control signals for an 8-bit, two-state-access area. The upper address bus (D_{15} to D_8) is used to access these areas. The $\overline{LWR}$ pin is always high. Wait states cannot be inserted.

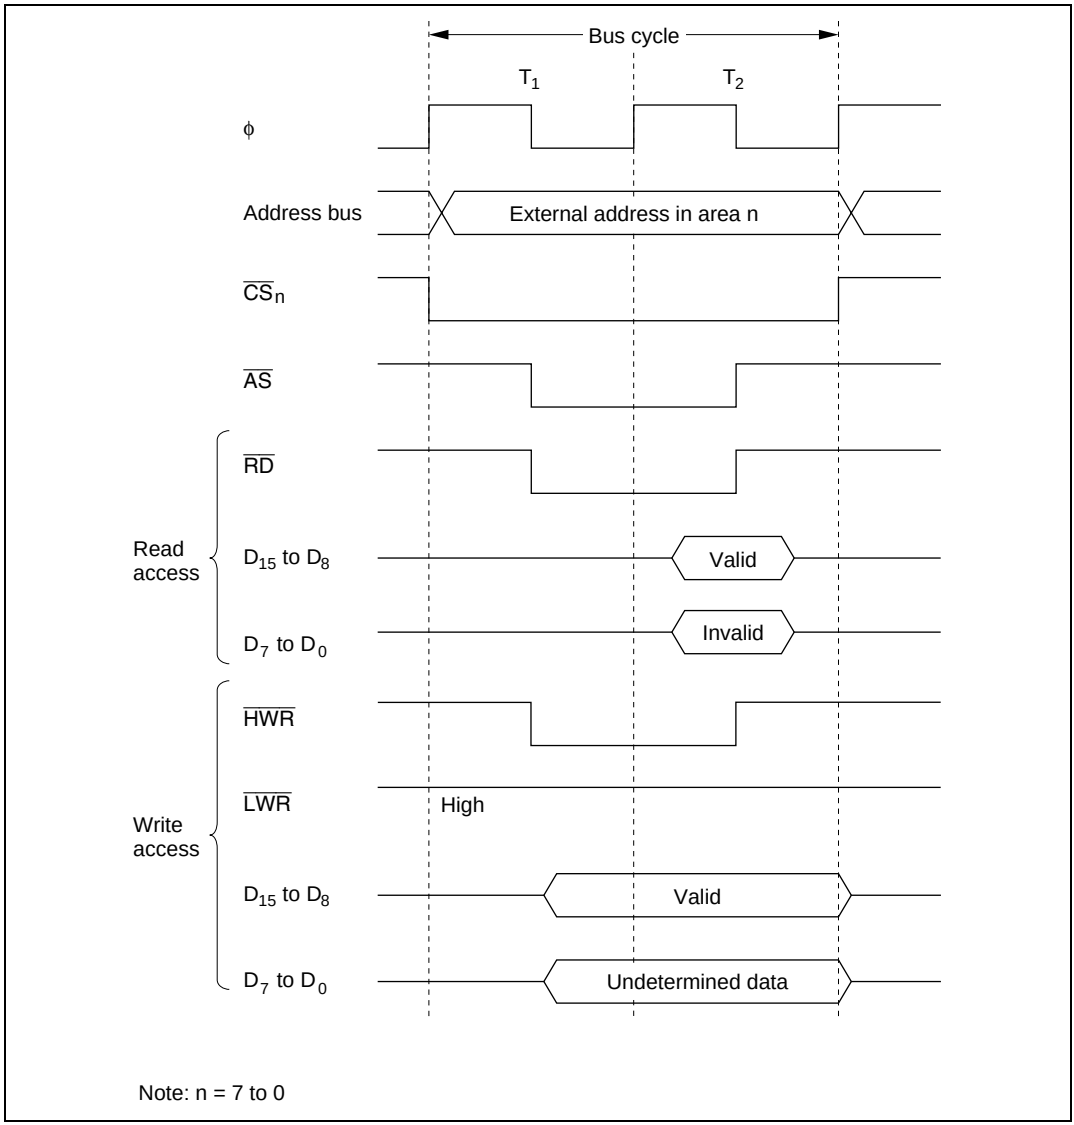

Figure 6.5 Bus Control Signal Timing for 8-Bit, Two-State-Access Area

16-Bit, Three-State-Access Areas: Figures 6.6 to 6.8 show the timing of bus control signals for a 16-bit, three-state-access area. In these areas, the upper address bus (D_{15} to D_8) is used to access even addresses and the lower address bus (D_7 to D_0) is used to access odd addresses. Wait states can be inserted.

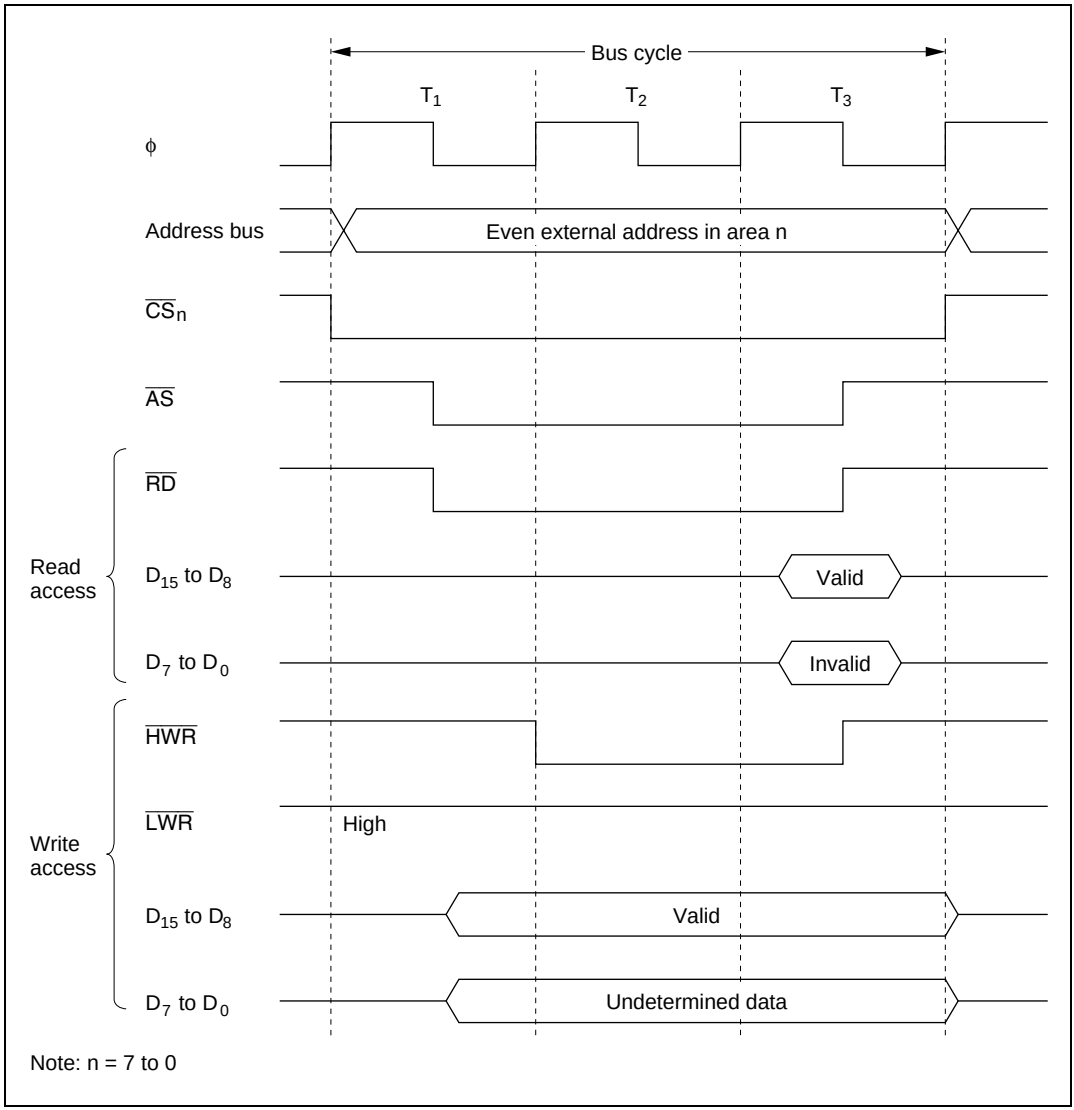

Figure 6.6 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (1) (Byte Access to Even Address)

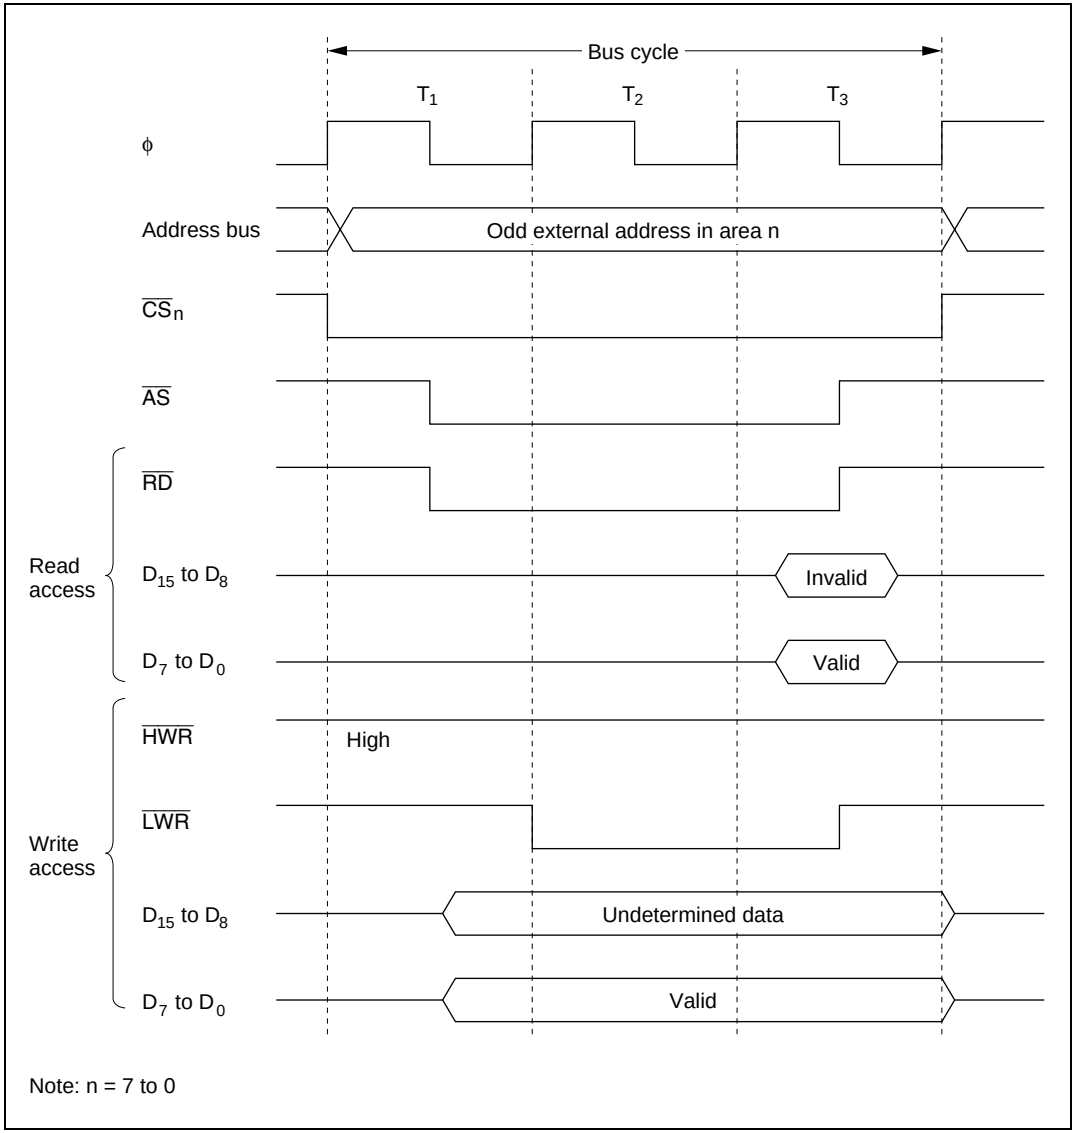

Figure 6.7 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (2) (Byte Access to Odd Address)

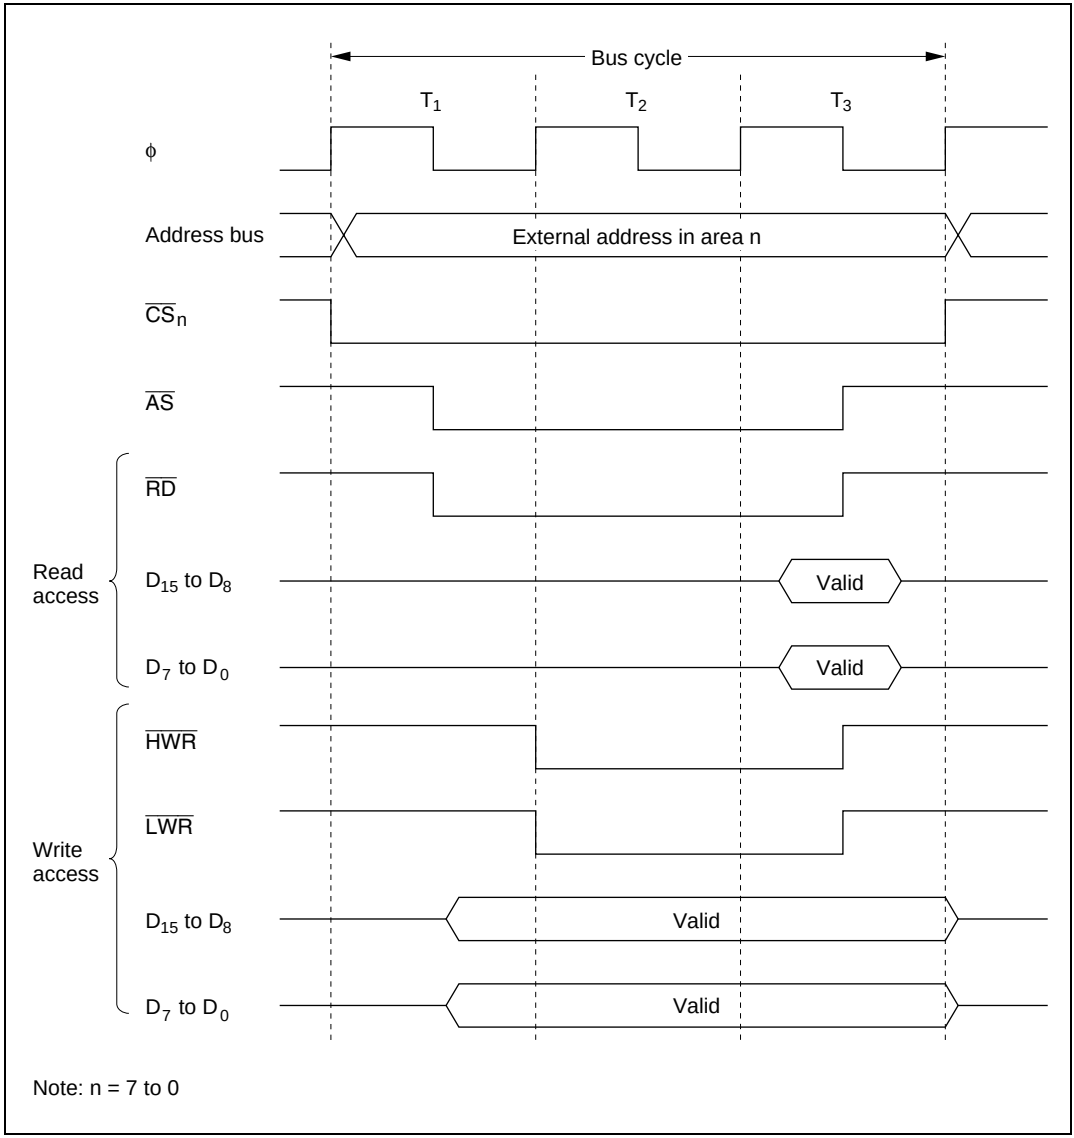

Figure 6.8 Bus Control Signal Timing for 16-Bit, Three-State-Access Area (3) (Word Access)

16-Bit, Two-State-Access Areas: Figures 6.9 to 6.11 show the timing of bus control signals for a 16-bit, two-state-access area. In these areas, the upper address bus (D_{15} to D_8) is used to access even addresses and the lower address bus (D_7 to D_0) is used to access odd addresses. Wait states cannot be inserted.

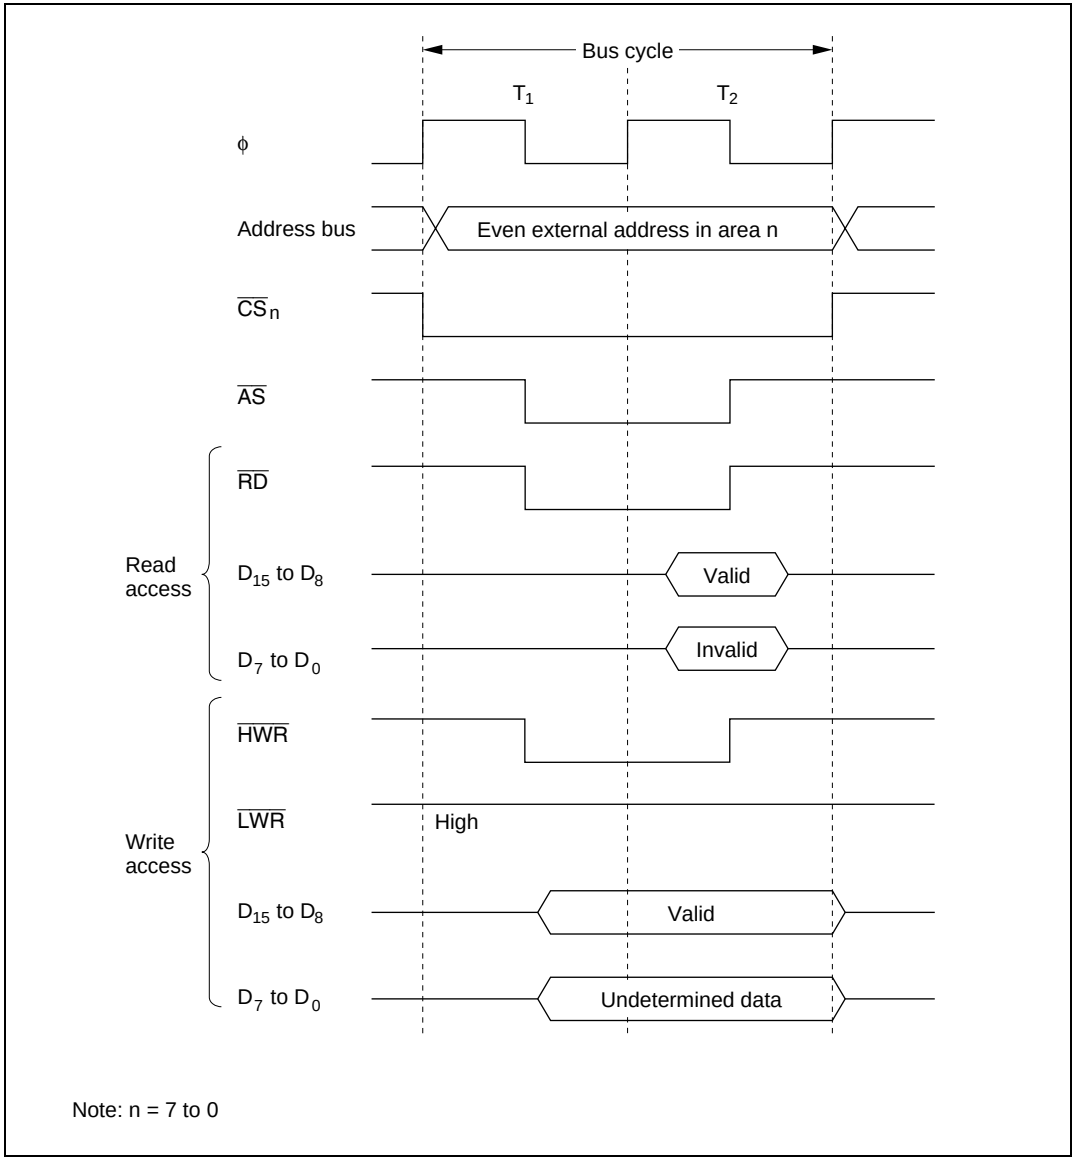

Figure 6.9 Bus Control Signal Timing for 16-Bit, Two-State-Access Area (1) (Byte Access to Even Address)

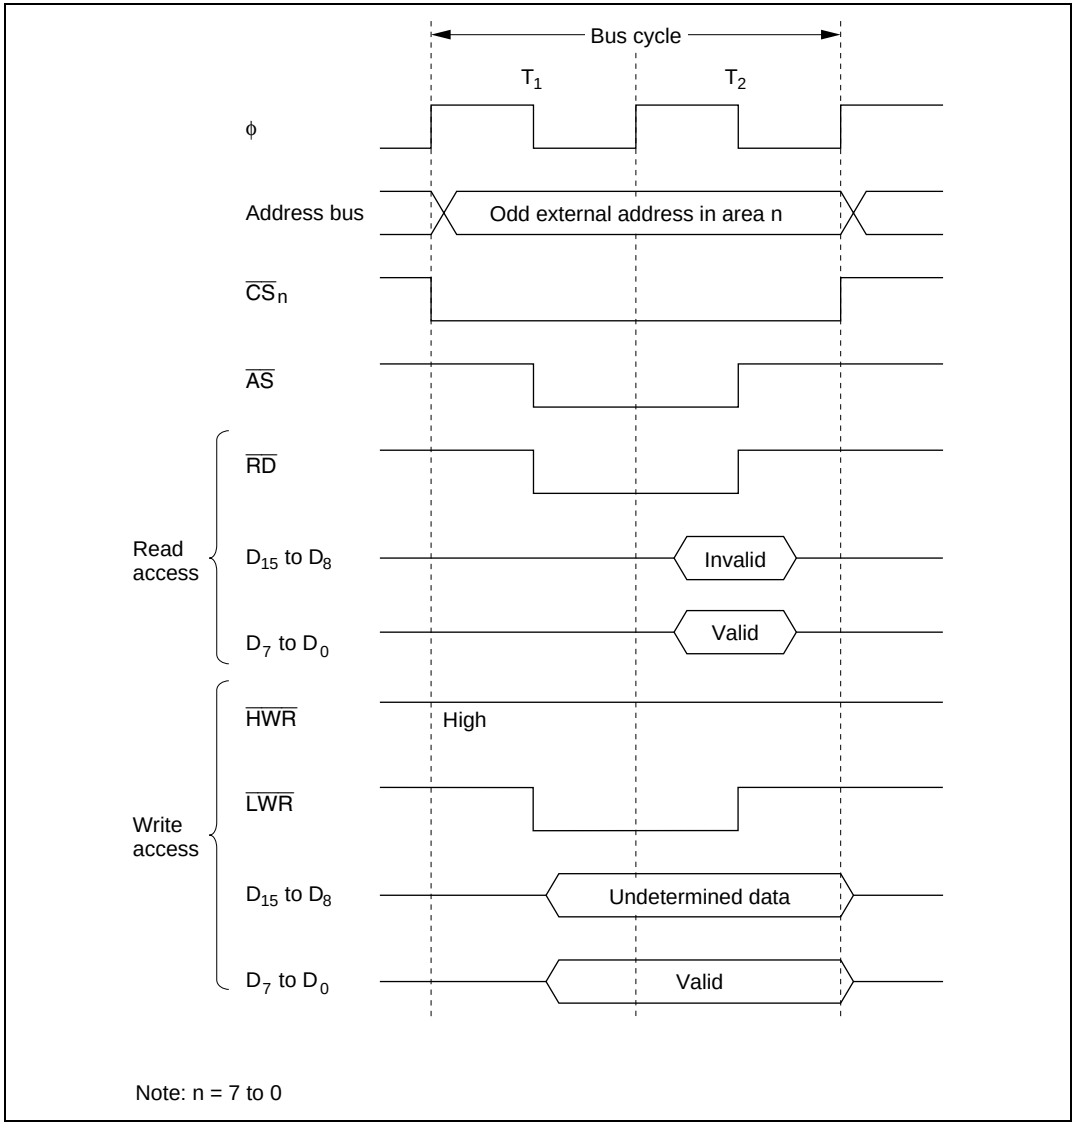

Figure 6.10 Bus Control Signal Timing for 16-Bit, Two-State-Access Area (2) (Byte Access to Odd Address)

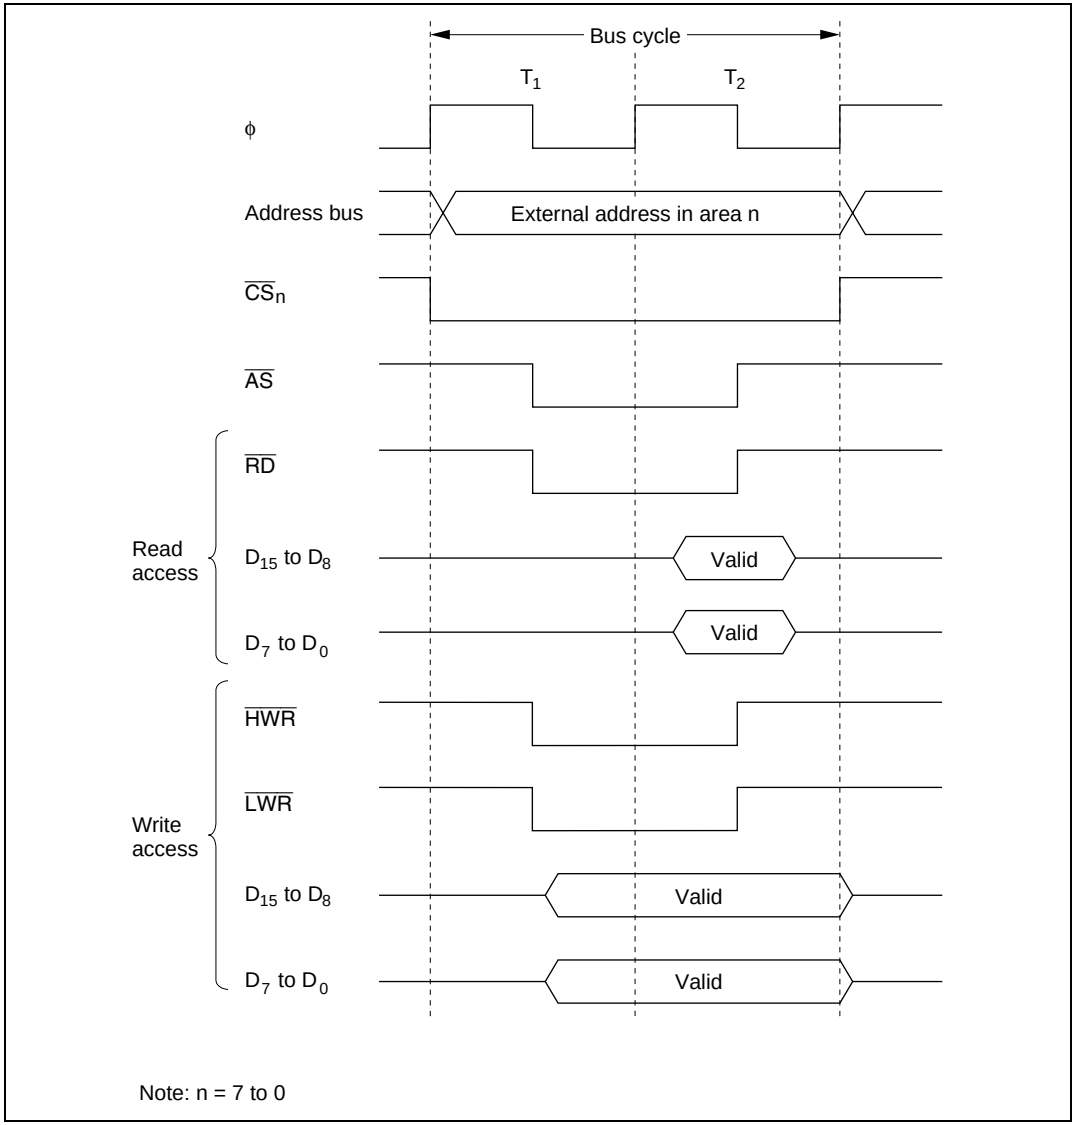

Figure 6.11 Bus Control Signal Timing for 16-Bit, Two-State-Access Area (3) (Word Access)

6.3.5 Wait Modes

Four wait modes can be selected as shown in table 6.5.

Table 6.5 Wait Mode Selection

ASTCR	WCER	WCR			
ASTn Bit	WCEn Bit	WMS1 Bit	WMS0 Bit	WSC Control	Wait Mode
0	—	—	—	Disabled	No wait states
1	0	—	—	Disabled	Pin wait mode 0
	1	0	0	Enabled	Programmable wait mode
			1	Enabled	No wait states
		1	0	Enabled	Pin wait mode 1
			1	Enabled	Pin auto-wait mode

Note: n = 7 to 0

Wait Mode in Areas Where Wait-State Controller is Disabled: External three-state access areas in which the wait-state controller is disabled (ASTn = 1, WCEn = 0) operate in pin wait mode 0. The other wait modes are unavailable. The settings of bits WMS1 and WMS0 are ignored in these areas.

- Pin Wait Mode 0

  Wait states can only be inserted by $\overline{\text{WAIT}}$ pin control. During access to an external three-state-access area, if the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock (ϕ) in the T_2 state, a wait state (T_W) is inserted. If the $\overline{\text{WAIT}}$ pin remains low, wait states continue to be inserted until the $\overline{\text{WAIT}}$ signal goes high. Figure 6.12 shows the timing.

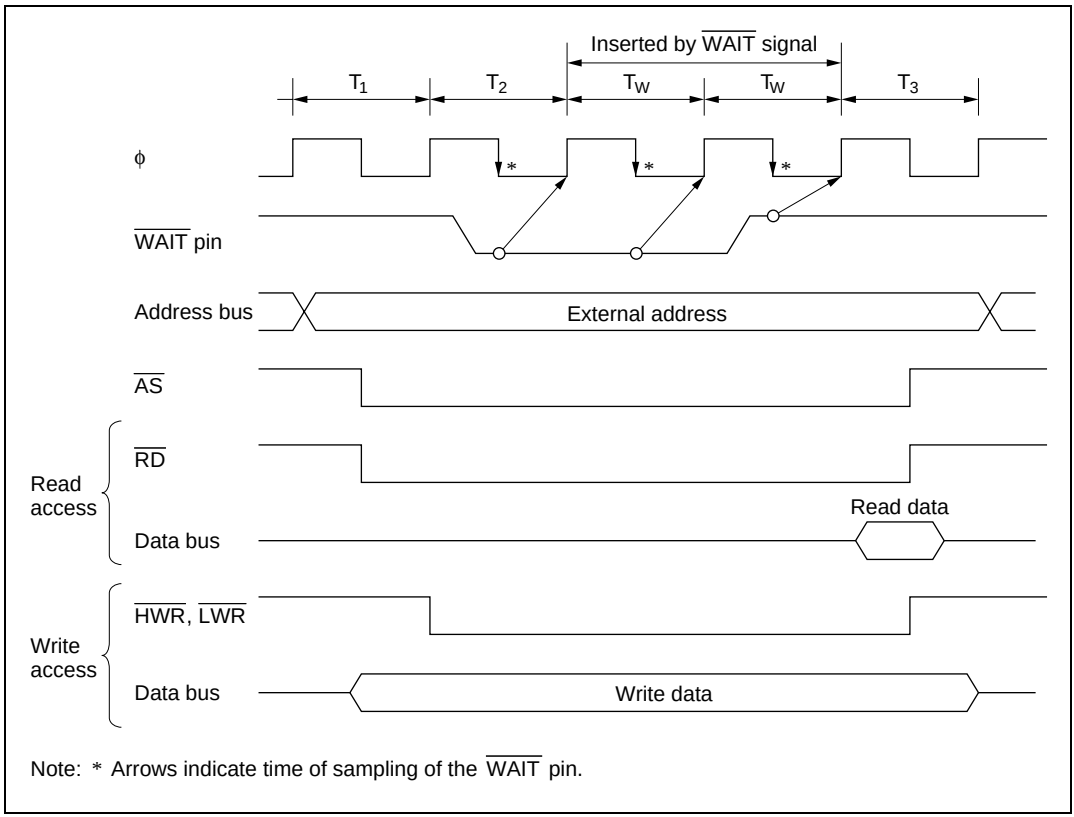

Figure 6.12 Pin Wait Mode 0

Wait Modes in Areas Where Wait-State Controller is Enabled: External three-state access areas in which the wait-state controller is enabled (ASTn = 1, WCEn = 1) can operate in pin wait mode 1, pin auto-wait mode, or programmable wait mode, as selected by bits WMS1 and WMS0. Bits WMS1 and WMS0 apply to all areas, so all areas in which the wait-state controller is enabled operate in the same wait mode.

- Pin Wait Mode 1

  In all accesses to external three-state-access areas, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted. If the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock (ϕ) in the last of these wait states, an additional wait state is inserted. If the $\overline{\text{WAIT}}$ pin remains low, wait states continue to be inserted until the $\overline{\text{WAIT}}$ signal goes high.

  Pin wait mode 1 is useful for inserting four or more wait states, or for inserting different numbers of wait states for different external devices.

  If the wait count is 0, this mode operates in the same way as pin wait mode 0.

  Figure 6.13 shows the timing when the wait count is 1 (WC1 = 0, WC0 = 1) and one additional wait state is inserted by $\overline{\text{WAIT}}$ input.

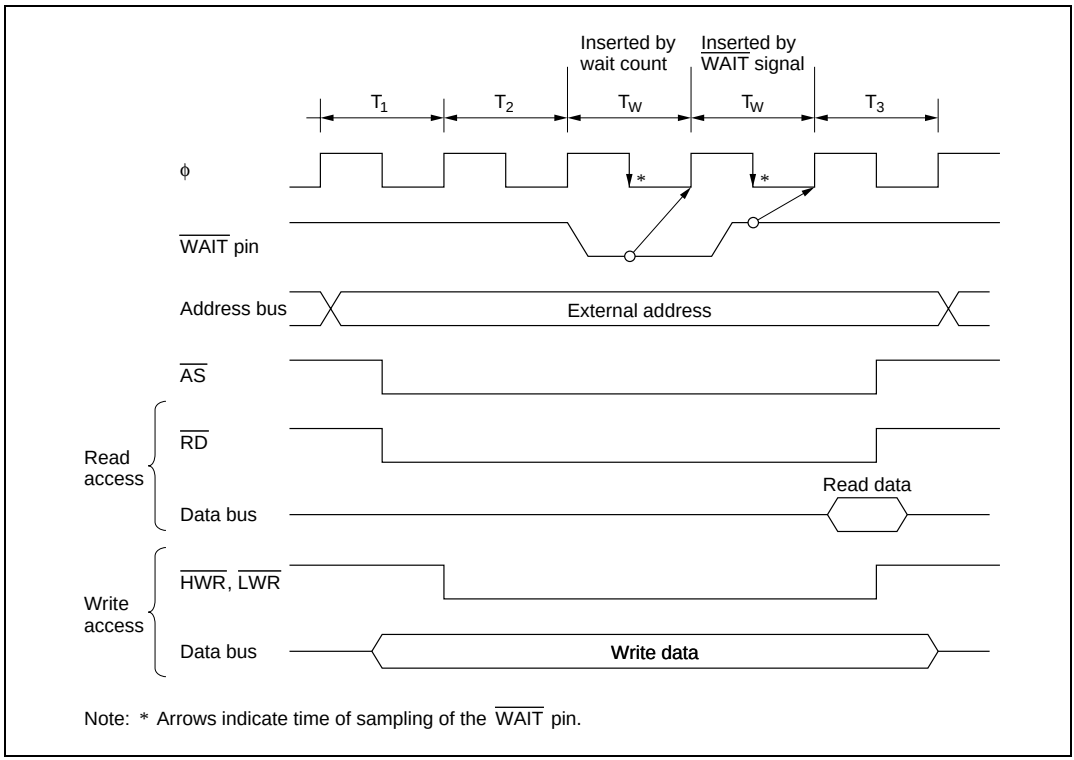

Figure 6.13 Pin Wait Mode 1

- Pin Auto-Wait Mode

  If the $\overline{\text{WAIT}}$ pin is low, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted.

  In pin auto-wait mode, if the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock (ϕ) in the T_2 state, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted. No additional wait states are inserted even if the $\overline{\text{WAIT}}$ pin remains low. Pin auto-wait mode can be used for an easy interface to low-speed memory, simply by routing the chip select signal to the $\overline{\text{WAIT}}$ pin.

  Figure 6.14 shows the timing when the wait count is 1.

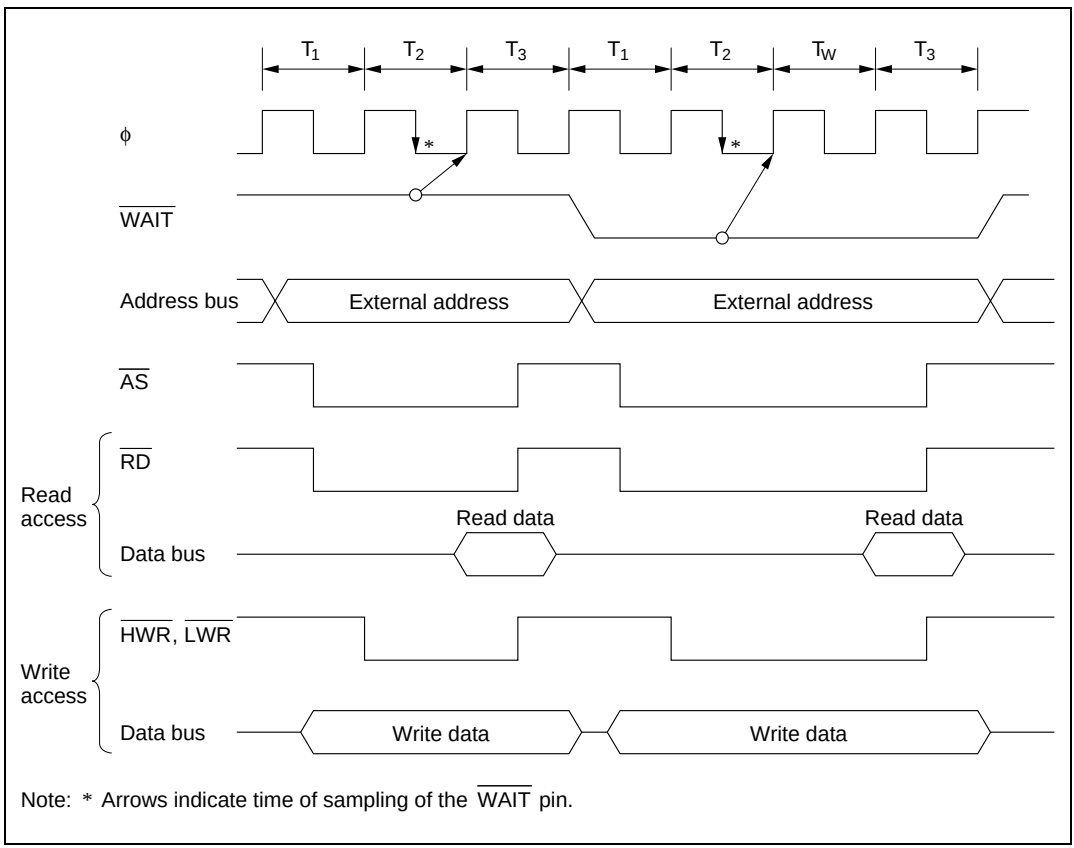

Figure 6.14 Pin Auto-Wait Mode

- Programmable Wait Mode

  The number of wait states (T_W) selected by bits WC1 and WC0 are inserted in all accesses to external three-state-access areas. Figure 6.15 shows the timing when the wait count is 1 (WC1 = 0, WC0 = 1).

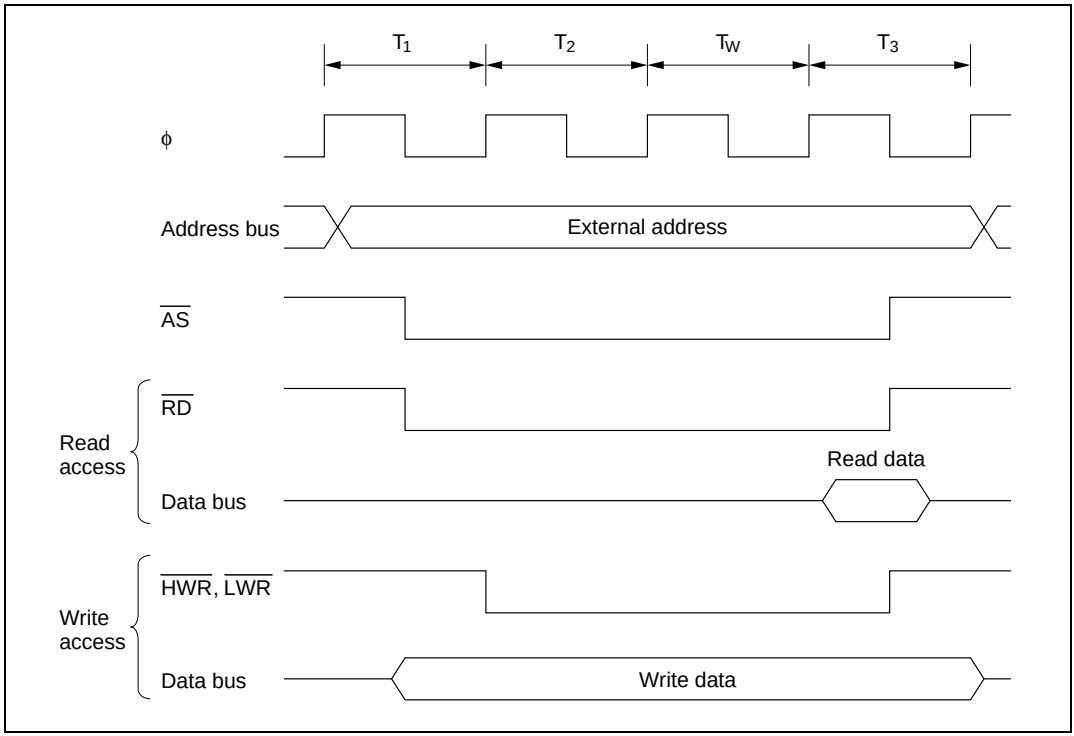

Figure 6.15 Programmable Wait Mode

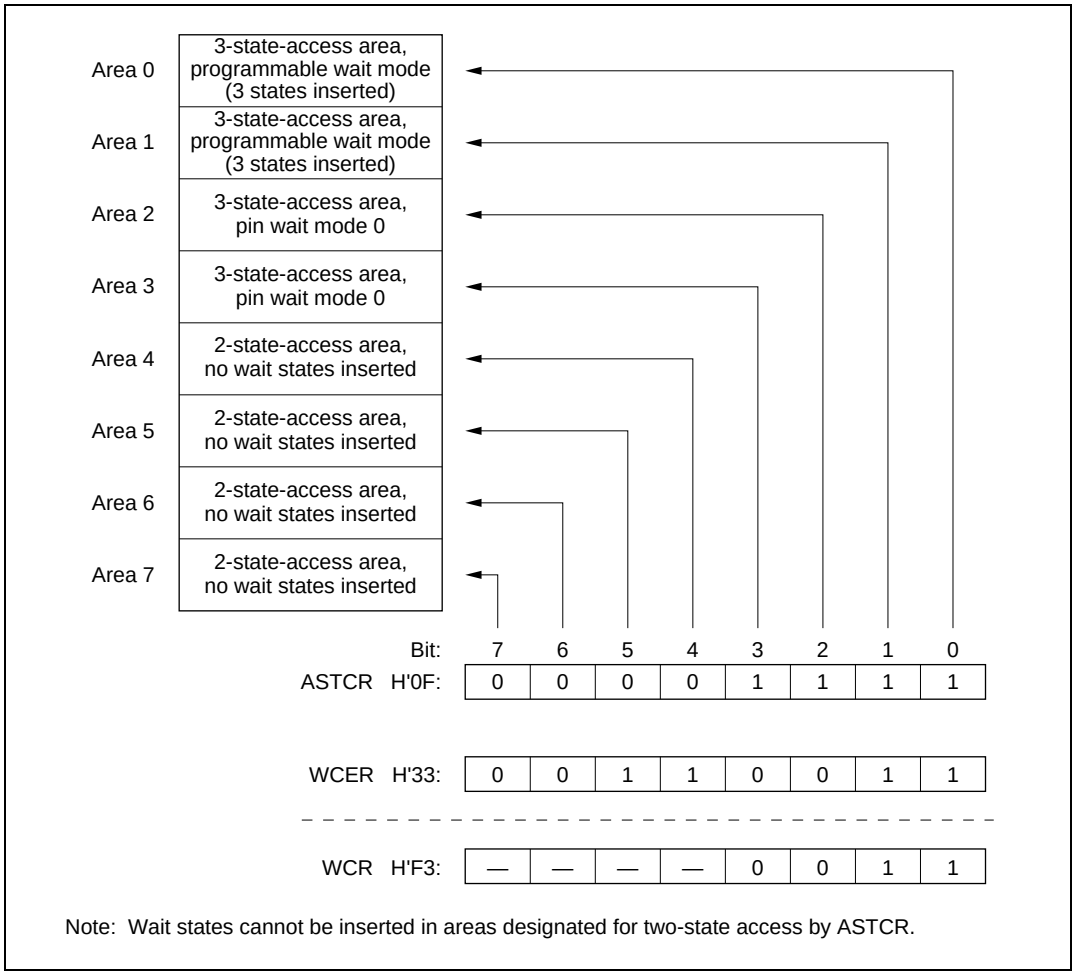
Example of Wait State Control Settings: A reset initializes ASTCR and WCER to H'FF and WCR to H'F3, selecting programmable wait mode and three wait states for all areas. Software can select other wait modes for individual areas by modifying the ASTCR, WCER, and WCR settings. Figure 6.16 shows an example of wait mode settings.



Note: Wait states cannot be inserted in areas designated for two-state access by ASTCR.

Figure 6.16 Wait Mode Settings (Example)

6.3.6 Interconnections with Memory (Example)

For each area, the bus controller can select two- or three-state access and an 8- or 16-bit data bus width. In three-state-access areas, wait states can be inserted in a variety of modes, simplifying the connection of both high-speed and low-speed devices.

Figure 6.18 shows an example of interconnections between the H8/3052BF and memory. Figure 6.17 shows a memory map for this example.

A 256-kword × 16-bit EPROM is connected to area 0. This device is accessed in three states via a 16-bit bus.

Two 32-kword × 8-bit SRAM devices (SRAM1 and SRAM2) are connected to area 1. These devices are accessed in two states via a 16-bit bus.

One 32-kword × 8-bit SRAM (SRAM3) is connected to area 2. This device is accessed via an 8-bit bus, using three-state access with an additional wait state inserted in pin auto-wait mode.

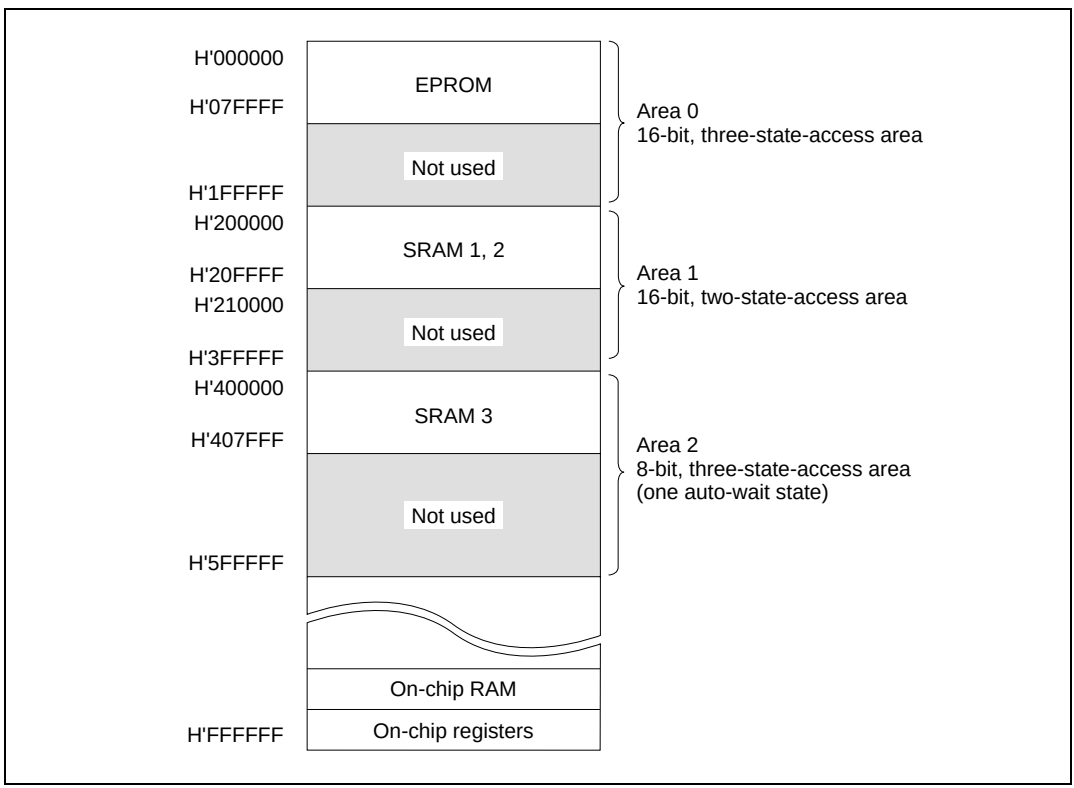


Figure 6.17 Memory Map (Example)

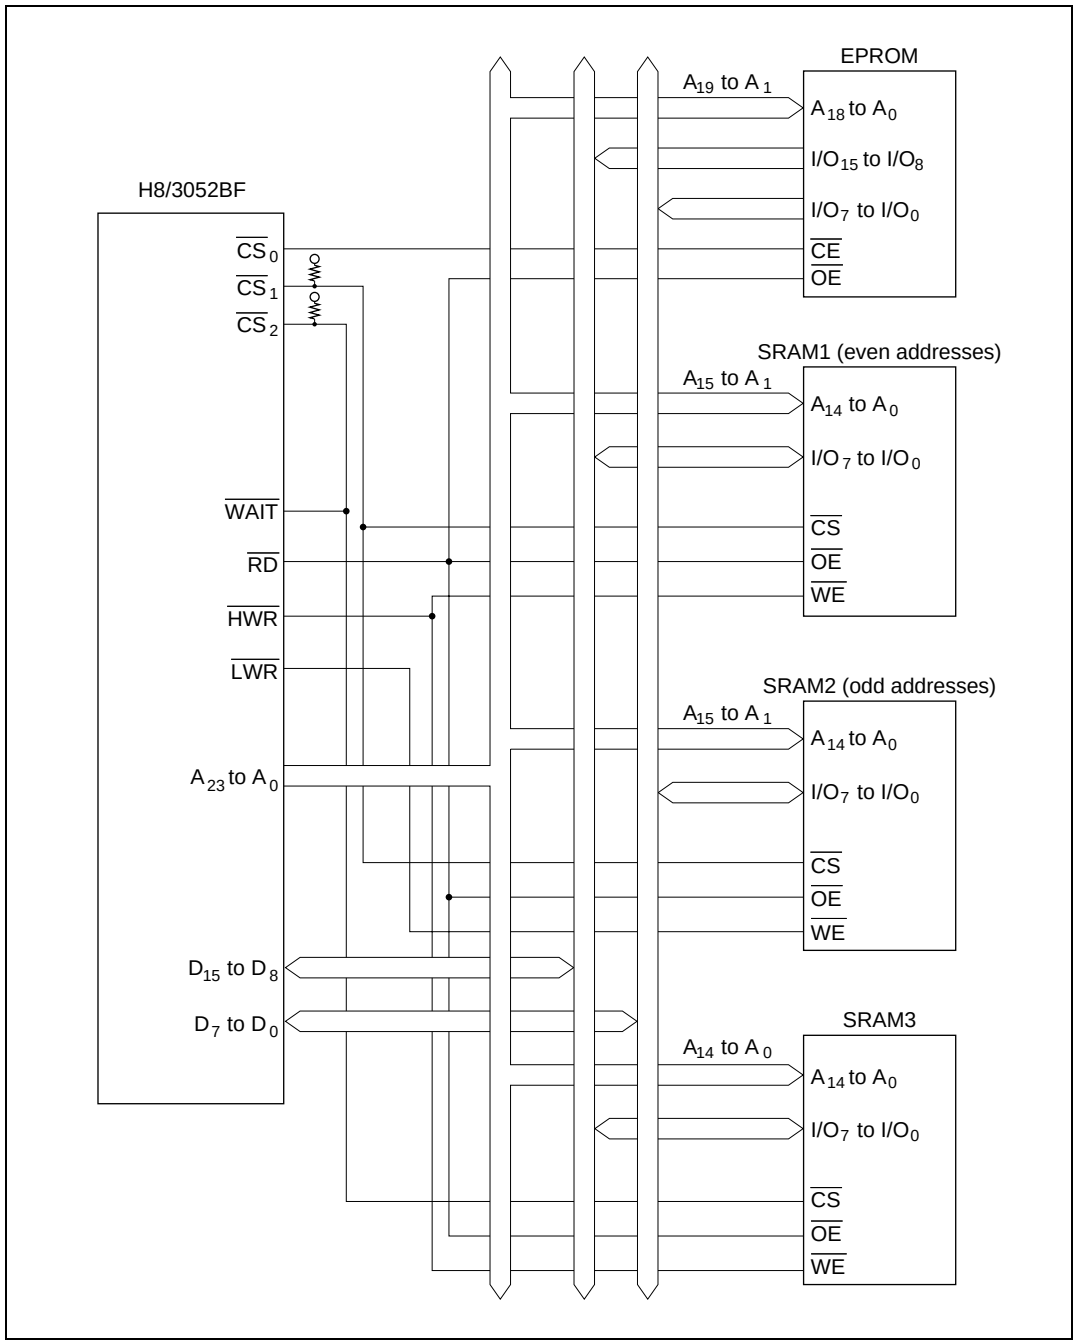

Figure 6.18 Interconnections with Memory (Example)

6.3.7 Bus Arbiter Operation

The bus controller has a built-in bus arbiter that arbitrates between different bus masters. There are four bus masters: the CPU, DMA controller (DMAC), refresh controller, and an external bus master. When a bus master has the bus right it can carry out read, write, or refresh access. Each bus master uses a bus request signal to request the bus right. At fixed times the bus arbiter determines priority and uses a bus acknowledge signal to grant the bus to a bus master, which can then operate using the bus.

The bus arbiter checks whether the bus request signal from a bus master is active or inactive, and returns an acknowledge signal to the bus master if the bus request signal is active. When two or more bus masters request the bus, the highest-priority bus master receives an acknowledge signal. The bus master that receives an acknowledge signal can continue to use the bus until the acknowledge signal is deactivated.

The bus master priority order is:

(High) External bus master > refresh controller > DMAC > CPU (Low)

The bus arbiter samples the bus request signals and determines priority at all times, but it does not always grant the bus immediately, even when it receives a bus request from a bus master with higher priority than the current bus master. Each bus master has certain times at which it can release the bus to a higher-priority bus master.

CPU: The CPU is the lowest-priority bus master. If the DMAC, refresh controller, or an external bus master requests the bus while the CPU has the bus right, the bus arbiter transfers the bus right to the bus master that requested it. The bus right is transferred at the following times:

- The bus right is transferred at the boundary of a bus cycle. If word data is accessed by two consecutive byte accesses, however, the bus right is not transferred between the two byte accesses.
- If another bus master requests the bus while the CPU is performing internal operations, such as executing a multiply or divide instruction, the bus right is transferred immediately. The CPU continues its internal operations.
- If another bus master requests the bus while the CPU is in sleep mode, the bus right is transferred immediately.

DMAC: When the DMAC receives an activation request, it requests the bus right from the bus arbiter. If the DMAC is bus master and the refresh controller or an external bus master requests the bus, the bus arbiter transfers the bus right from the DMAC to the bus master that requested the bus. The bus right is transferred at the following times.

The bus right is transferred when the DMAC finishes transferring 1 byte or 1 word. A DMAC transfer cycle consists of a read cycle and a write cycle. The bus right is not transferred between the read cycle and the write cycle.

There is a priority order among the DMAC channels. For details see section 8.4.9, Multiple-Channel Operation.

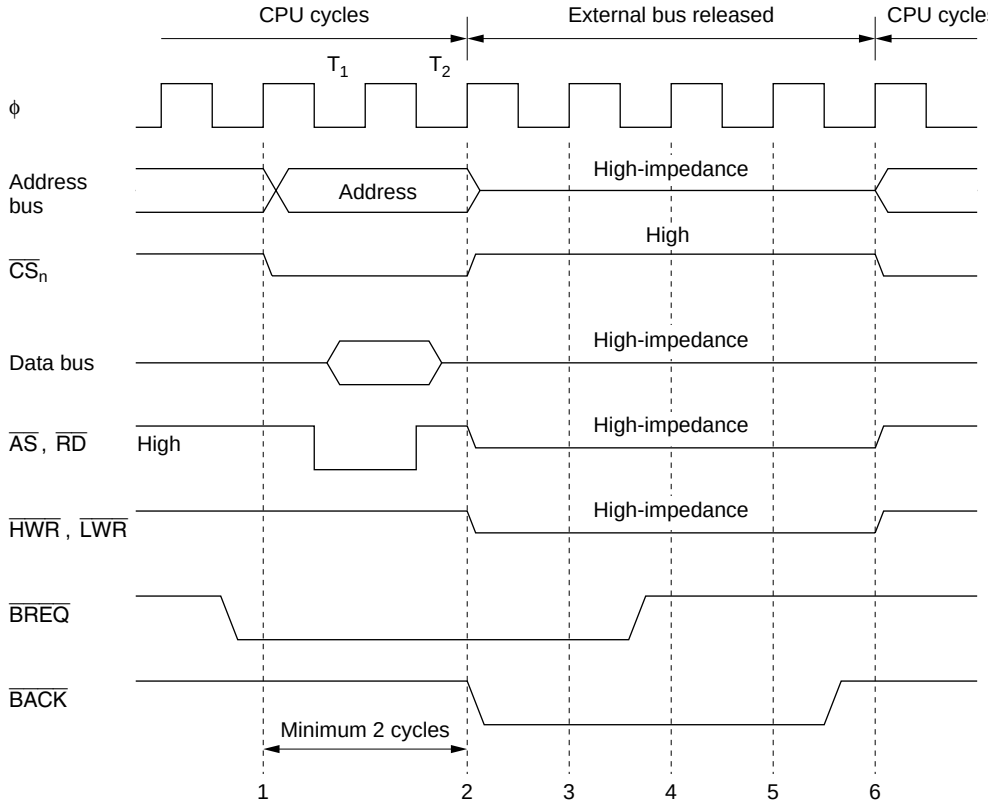
Refresh Controller: When a refresh cycle is requested, the refresh controller requests the bus right from the bus arbiter. When the refresh cycle is completed, the refresh controller releases the bus. For details see section 7, Refresh Controller.

External Bus Master: When the BRLE bit is set to 1 in BRCR, the bus can be released to an external bus master. The external bus master has highest priority, and requests the bus right from the bus arbiter by driving the $\overline{\text{BREQ}}$ signal low. Once the external bus master gets the bus, it keeps the bus right until the $\overline{\text{BREQ}}$ signal goes high. While the bus is released to an external bus master, the H8/3052BF holds the address bus and data bus control signals ($\overline{\text{AS}}$, $\overline{\text{RD}}$, $\overline{\text{HWR}}$, and $\overline{\text{LWR}}$) in the high-impedance state, holds the chip select signals high ($\overline{\text{CS}}_n$: n = 7 to 0), and holds the $\overline{\text{BACK}}$ pin in the low output state.

The bus arbiter samples the $\overline{\text{BREQ}}$ pin at the rise of the system clock (ϕ). If $\overline{\text{BREQ}}$ is low, the bus is released to the external bus master at the appropriate opportunity. The $\overline{\text{BREQ}}$ signal should be held low until the $\overline{\text{BACK}}$ signal goes low.

When the $\overline{\text{BREQ}}$ pin is high in two consecutive samples, the $\overline{\text{BACK}}$ signal is driven high to end the bus-release cycle.

Figure 6.19 shows the timing when the bus right is requested by an external bus master during a read cycle in a two-state-access area. There is a minimum interval of two states from when the $\overline{BREQ}$ signal goes low until the bus is released.



Note: n = 7 to 0

1 Low $\overline{BREQ}$ signal is sampled at rise of T_1 state.
2 $\overline{BACK}$ signal goes low at end of CPU read cycle, releasing bus right to external bus master.
3 $\overline{BREQ}$ pin continues to be sampled while bus is released to external bus master.
4, 5 High $\overline{BREQ}$ signal is sampled twice consecutively.
6 $\overline{BREQ}$ signal goes high, ending bus-release cycle.

Figure 6.19 External-Bus-Released State (Two-State-Access Area during Read Cycle)

6.4 Usage Notes

6.4.1 Connection to Dynamic RAM and Pseudo-Static RAM

A different bus control signal timing applies when dynamic RAM or pseudo-static RAM is connected to area 3. For details see section 7, Refresh Controller.

6.4.2 Register Write Timing

ABWCR, ASTCR, and WCER Write Timing: Data written to ABWCR, ASTCR, or WCER takes effect starting from the next bus cycle. Figure 6.20 shows the timing when an instruction fetched from area 0 changes area 0 from three-state access to two-state access.

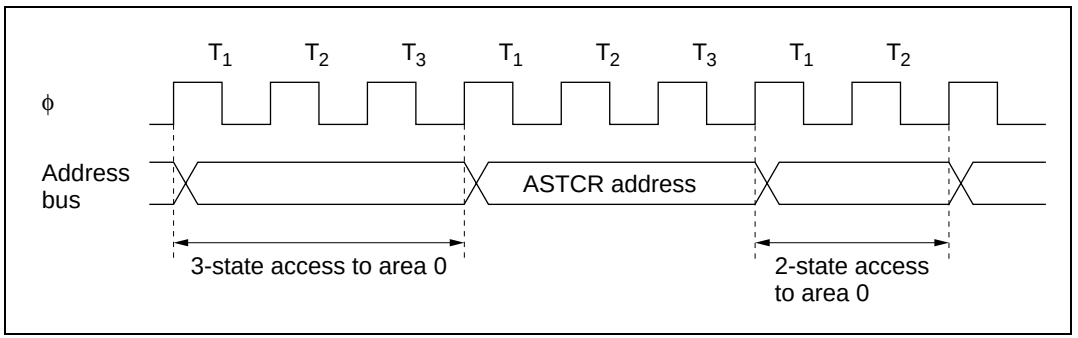


Figure 6.20 ASTCR Write Timing

DDR Write Timing: Data written to a data direction register (DDR) to change a $\overline{CS}_n$ pin from $\overline{CS}_n$ output to generic input, or vice versa, takes effect starting from the T_3 state of the DDR write cycle. Figure 6.21 shows the timing when the $\overline{CS}_1$ pin is changed from generic input to $\overline{CS}_1$ output.

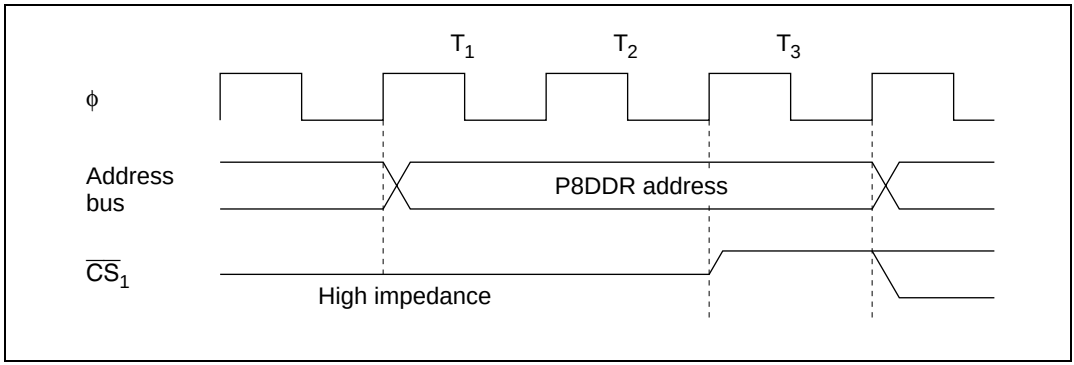

Figure 6.21 DDR Write Timing

BRCR Write Timing: Data written to switch between A_{23}, A_{22}, or A_{21} output and generic input or output takes effect starting from the T_3 state of the BRCR write cycle. Figure 6.22 shows the timing when a pin is changed from generic input to A_{23}, A_{22}, or A_{21} output.

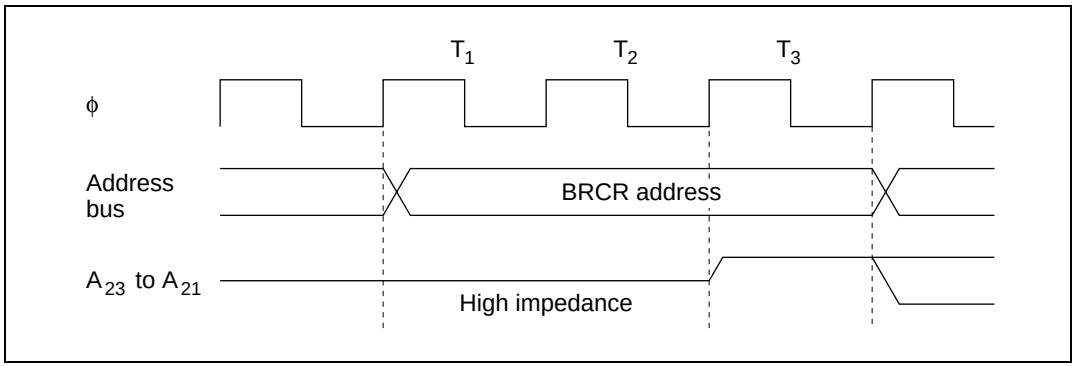

Figure 6.22 BRCR Write Timing

6.4.3 $\overline{\text{BREQ}}$ Input Timing

After driving the $\overline{\text{BREQ}}$ pin low, hold it low until $\overline{\text{BACK}}$ goes low. If $\overline{\text{BREQ}}$ returns to the high level before $\overline{\text{BACK}}$ goes low, the bus arbiter may operate incorrectly.

To terminate the external-bus-released state, hold the $\overline{\text{BREQ}}$ signal high for at least three states. If $\overline{\text{BREQ}}$ is high for too short an interval, the bus arbiter may operate incorrectly.

6.4.4 Transition to Software Standby Mode

If contention occurs between a transition to software standby mode and a bus request from an external bus master, the bus may be released for one state just before the transition to software standby mode (see figure 6.23). When using software standby mode, clear the BRLE bit to 0 in BRCR before executing the SLEEP instruction.

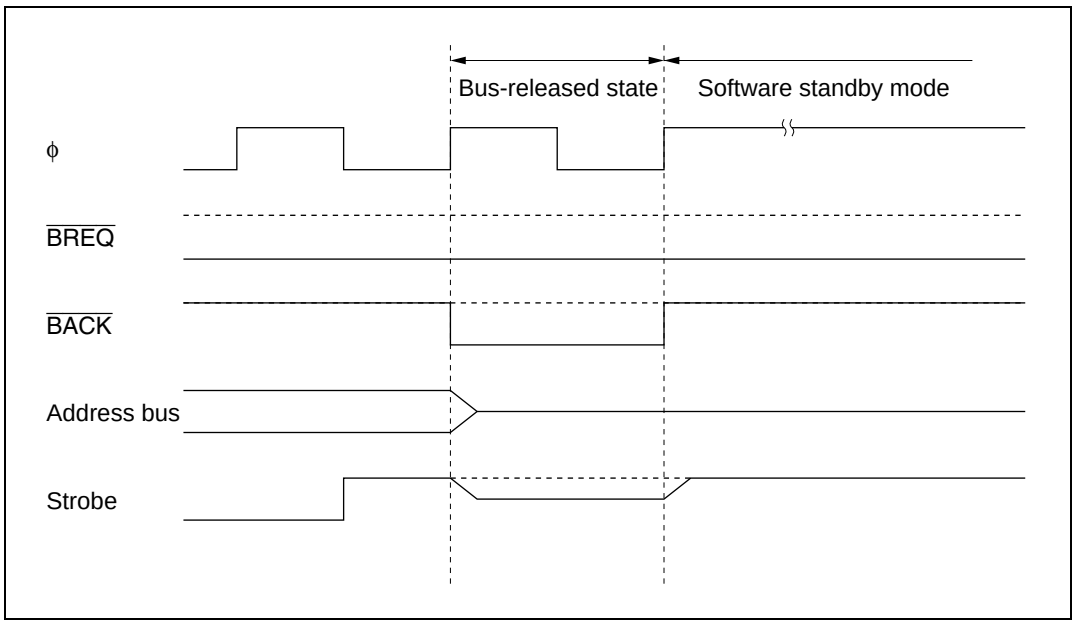

Figure 6.23 Contention between Bus-Released State and Software Standby Mode

Section 7 Refresh Controller

7.1 Overview

The H8/3052BF has an on-chip refresh controller that enables direct connection of 16-bit-wide DRAM or pseudo-static RAM (PSRAM).

DRAM or pseudo-static RAM can be directly connected to area 3 of the external address space.

A maximum 128 kbytes can be connected in modes 1 and 2 (1-Mbyte modes). A maximum 2 Mbytes can be connected in modes 3, 4, and 6 (16-Mbyte modes).

Systems that do not need to refresh DRAM or pseudo-static RAM can use the refresh controller as an 8-bit interval timer.

When the refresh controller is not used, it can be independently halted to conserve power. For details see section 20.6, Module Standby Function.

Note: The refresh function cannot be used in modes 5 and 7.

7.1.1 Features

The refresh controller can be used for one of three functions: DRAM refresh control, pseudo-static RAM refresh control, or 8-bit interval timing. Features of the refresh controller are listed below.

Features as a DRAM Refresh Controller

- Enables direct connection of 16-bit-wide DRAM
- Selection of 2$\overline{\text{CAS}}$ or 2$\overline{\text{WE}}$ mode
- Selection of 8-bit or 9-bit column address multiplexing for DRAM address input
  Examples:
  — 1-Mbit DRAM: 8-bit row address × 8-bit column address
  — 4-Mbit DRAM: 9-bit row address × 9-bit column address
  — 4-Mbit DRAM: 10-bit row address × 8-bit column address
- $\overline{\text{CAS}}$-before-$\overline{\text{RAS}}$ refresh control
- Software-selectable refresh interval
- Software-selectable self-refresh mode
- Wait states can be inserted

Features as a Pseudo-Static RAM Refresh Controller

- $\overline{\text{RFSH}}$ signal output for refresh control
- Software-selectable refresh interval
- Software-selectable self-refresh mode
- Wait states can be inserted

Features as an Interval Timer

- Refresh timer counter (RTCNT) can be used as an 8-bit up-counter
- Selection of seven counter clock sources: $\phi/2$, $\phi/8$, $\phi/32$, $\phi/128$, $\phi/512$, $\phi/2048$, $\phi/4096$
- Interrupts can be generated by compare match between RTCNT and the refresh time constant register (RTCOR)

7.1.2 Block Diagram

Figure 7.1 shows a block diagram of the refresh controller.

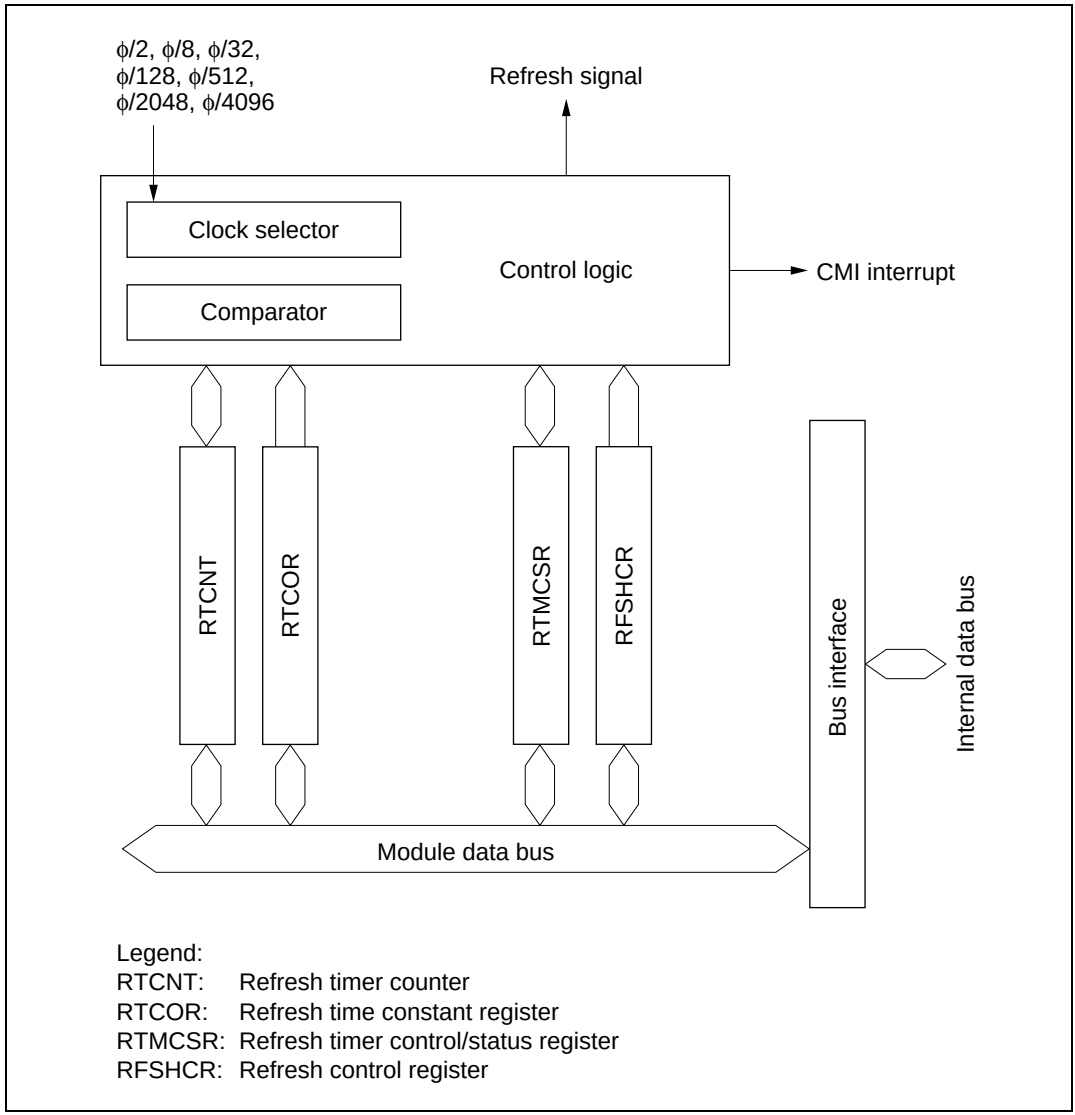

Figure 7.1 Block Diagram of Refresh Controller

7.1.3 Pin Configuration

Table 7.1 summarizes the refresh controller's input/output pins.

Table 7.1 Refresh Controller Pins

	Signal			
Pin	**Name**	**Abbr.**	**I/O**	**Function**
$\overline{RFSH}$	Refresh	$\overline{RFSH}$	Output	Goes low during refresh cycles; used to refresh DRAM and PSRAM
$\overline{HWR}$	Upper write/upper column address strobe	$\overline{UW}$/$\overline{UCAS}$	Output	Connects to the $\overline{UW}$ pin of 2$\overline{WE}$ DRAM or $\overline{UCAS}$ pin of 2$\overline{CAS}$ DRAM
$\overline{LWR}$	Lower write/lower column address strobe	$\overline{LW}$/$\overline{LCAS}$	Output	Connects to the $\overline{LW}$ pin of 2$\overline{WE}$ DRAM or $\overline{LCAS}$ pin of 2$\overline{CAS}$ DRAM
$\overline{RD}$	Column address strobe/ write enable	$\overline{CAS}$/$\overline{WE}$	Output	Connects to the $\overline{CAS}$ pin of 2$\overline{WE}$ DRAM or $\overline{WE}$ pin of 2$\overline{CAS}$ DRAM
$\overline{CS_3}$	Row address strobe	$\overline{RAS}$	Output	Connects to the $\overline{RAS}$ pin of DRAM

7.1.4 Register Configuration

Table 7.2 summarizes the refresh controller's registers.

Table 7.2 Refresh Controller Registers

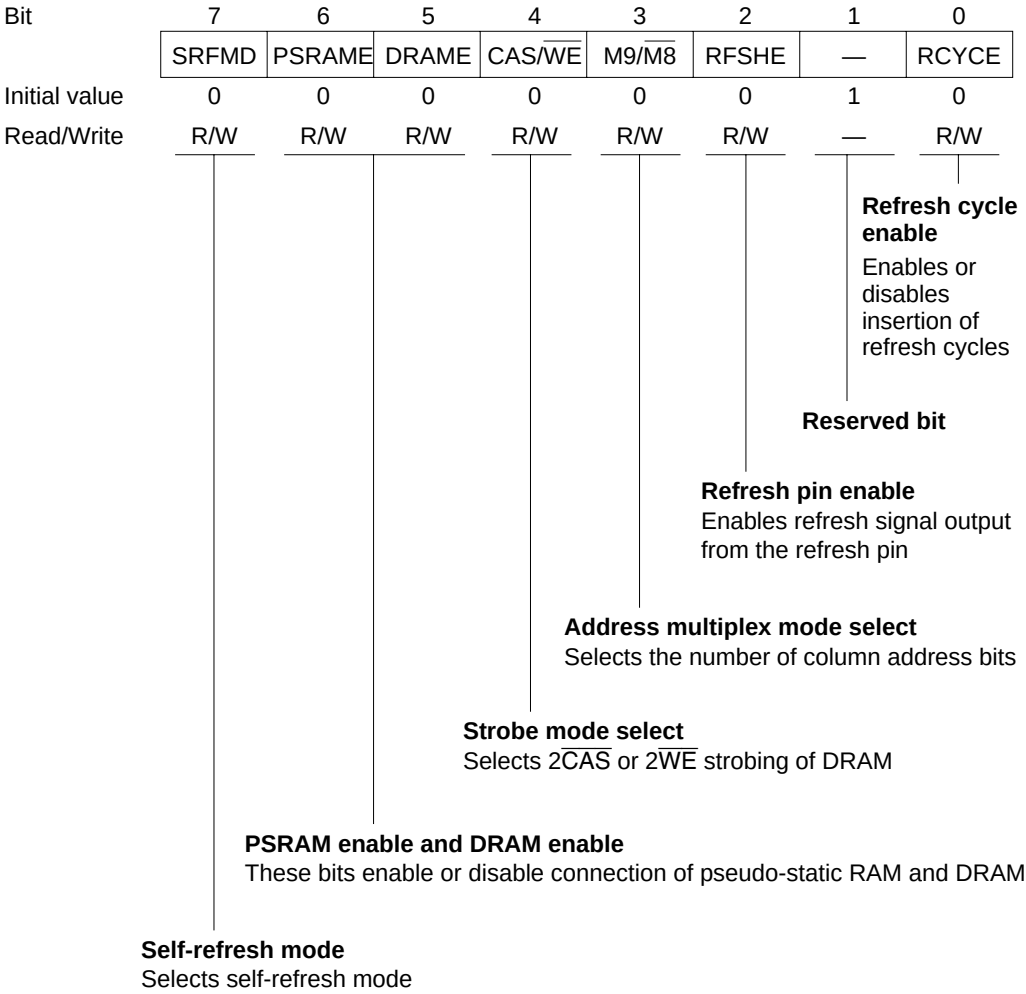
Address*	Name	Abbreviation	R/W	Initial Value
H'FFAC	Refresh control register	RFSHCR	R/W	H'02
H'FFAD	Refresh timer control/status register	RTMCSR	R/W	H'07
H'FFAE	Refresh timer counter	RTCNT	R/W	H'00
H'FFAF	Refresh time constant register	RTCOR	R/W	H'FF

Note: * Lower 16 bits of the address.

7.2 Register Descriptions

7.2.1 Refresh Control Register (RFSHCR)

RFSHCR is an 8-bit readable/writable register that selects the operating mode of the refresh controller.



RFSHCR is initialized to H'02 by a reset and in hardware standby mode.

Bit 7—Self-Refresh Mode (SRFMD): Specifies DRAM or pseudo-static RAM self-refresh during software standby mode. When PSRAME = 1 and DRAME = 0, after the SRFMD bit is set to 1, pseudo-static RAM can be self-refreshed when the H8/3052BF enters software standby mode. When PSRAME = 0 and DRAME = 1, after the SRFMD bit is set to 1, DRAM can be self-refreshed when the H8/3052BF enters software standby mode. In either case, the normal access state resumes on exit from software standby mode.

Bit 7: SRFMD	Description
0	DRAM or PSRAM self-refresh is disabled in software standby mode (Initial value)
1	DRAM or PSRAM self-refresh is enabled in software standby mode

Bit 6—PSRAM Enable (PSRAME) and Bit 5—DRAM Enable (DRAME): These bits enable or disable connection of pseudo-static RAM and DRAM to area 3 of the external address space.

When DRAM or pseudo-static RAM is connected, the bus cycle and refresh cycle of area 3 consist of three states, regardless of the setting in the access state control register (ASTCR). If AST3 = 0 in ASTCR, wait states cannot be inserted.

When the PSRAME or DRAME bit is set to 1, bits 0, 2, 3, and 4 in RFSHCR and registers RTMCSR, RTCNT, and RTCOR are write-disabled, except that the CMF flag in RTMCSR can be cleared by writing 0.

Bit 6: PSRAME	Bit 5: DRAME	Description
0	0	Can be used as an interval timer (Initial value) (DRAM and PSRAM cannot be directly connected)
	1	DRAM can be directly connected
1	0	PSRAM can be directly connected
	1	Illegal setting

Bit 4—Strobe Mode Select (CAS/$\overline{\text{WE}}$): Selects 2$\overline{\text{CAS}}$ or 2$\overline{\text{WE}}$ mode. The setting of this bit is valid when PSRAME = 0 and DRAME = 1. This bit is write-disabled when the PSRAME or DRAME bit is set to 1.

Bit 4: CAS/$\overline{\text{WE}}$	Description
0	2$\overline{\text{WE}}$ mode (Initial value)
1	2$\overline{\text{CAS}}$ mode

Bit 3—Address Multiplex Mode Select (M9/$\overline{\text{M8}}$): Selects 8-bit or 9-bit column addressing.

The setting of this bit is valid when PSRAME = 0 and DRAME = 1. This bit is write-disabled when the PSRAME or DRAME bit is set to 1.

Bit 3: M9/$\overline{\text{M8}}$	Description	
0	8-bit column address mode	(Initial value)
1	9-bit column address mode	

Bit 2—Refresh Pin Enable (RFSHE): Enables or disables refresh signal output from the $\overline{\text{RFSH}}$ pin. This bit is write-disabled when the PSRAME or DRAME bit is set to 1.

Bit 2: RFSHE	Description	
0	Refresh signal output at the $\overline{\text{RFSH}}$ pin is disabled (the $\overline{\text{RFSH}}$ pin can be used as a generic input/output port)	(Initial value)
1	Refresh signal output at the $\overline{\text{RFSH}}$ pin is enabled	

Bit 1—Reserved: Read-only bit, always read as 1.

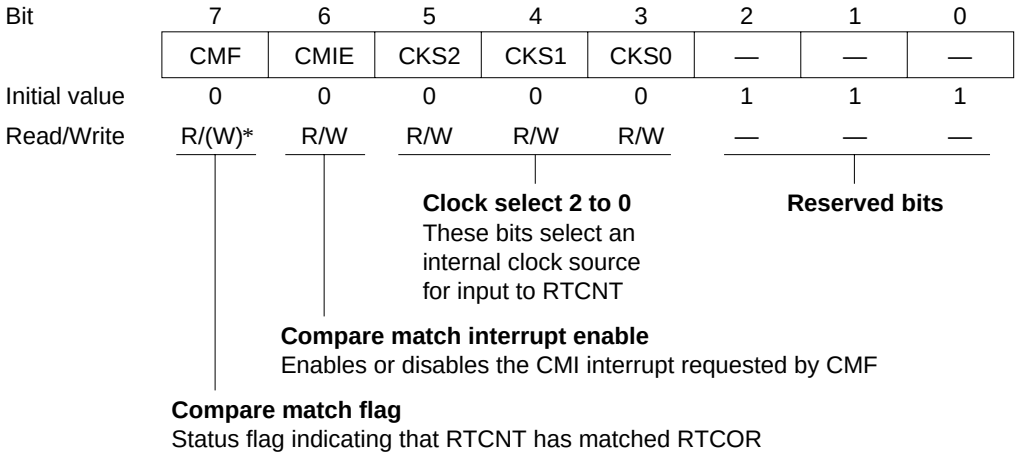
Bit 0—Refresh Cycle Enable (RCYCE): Enables or disables insertion of refresh cycles.

The setting of this bit is valid when PSRAME = 1 or DRAME = 1. When PSRAME = 0 and DRAME = 0, refresh cycles are not inserted regardless of the setting of this bit.

Bit 0: RCYCE	Description	
0	Refresh cycles are disabled	(Initial value)
1	Refresh cycles are enabled for area 3	

7.2.2 Refresh Timer Control/Status Register (RTMCSR)

RTMCSR is an 8-bit readable/writable register that selects the clock source for RTCNT. It also enables or disables interrupt requests when the refresh controller is used as an interval timer.



Note: * Only 0 can be written, to clear the flag.

Bits 7 and 6 are initialized by a reset and in standby mode. Bits 5 to 3 are initialized by a reset and in hardware standby mode, but retain their previous values on transition to software standby mode.

Bit 7—Compare Match Flag (CMF): This status flag indicates that the RTCNT and RTCOR values have matched.

Bit 7: CMF	Description
0	[Clearing condition] Cleared by reading CMF when CMF = 1, then writing 0 in CMF
1	[Setting condition] When RTCNT = RTCOR

Bit 6—Compare Match Interrupt Enable (CMIE): Enables or disables the CMI interrupt requested when the CMF flag is set to 1 in RTMCSR. The CMIE bit is always cleared to 0 when PSRAME = 1 or DRAME = 1.

Bit 6: CMIE	Description	
0	The CMI interrupt requested by CMF is disabled	(Initial value)
1	The CMI interrupt requested by CMF is enabled	

Bits 5 to 3—Clock Select 2 to 0 (CKS2 to CKS0): These bits select an internal clock source for input to RTCNT. When used for refresh control, the refresh controller outputs a refresh request at periodic intervals determined by compare match between RTCNT and RTCOR. When used as an interval timer, the refresh controller generates CMI interrupts at periodic intervals determined by compare match. These bits are write-disabled when the PSRAME bit or DRAME bit is set to 1.

Bit 5: CKS2	Bit 4: CKS1	Bit 3: CKS0	Description	
0	0	0	Clock input is disabled	(Initial value)
		1	φ/2 clock source	
	1	0	φ/8 clock source	
		1	φ/32 clock source	
1	0	0	φ/128 clock source	
		1	φ/512 clock source	
	1	0	φ/2048 clock source	
		1	φ/4096 clock source	

Bits 2 to 0—Reserved: Read-only bits, always read as 1.

7.2.3 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit readable/writable up-counter.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

RTCNT is an up-counter that is incremented by an internal clock selected by bits CKS2 to CKS0 in RTMCSR. When RTCNT matches RTCOR (compare match), the CMF flag is set to 1 and RTCNT is cleared to H'00.

RTCNT is write-disabled when the PSRAME bit or DRAME bit is set to 1. RTCNT is initialized to H'00 by a reset and in standby mode.

7.2.4 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit readable/writable register that determines the interval at which RTCNT is compare matched.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

RTCOR and RTCNT are constantly compared. When their values match, the CMF flag is set to 1 in RTMCSR, and RTCNT is simultaneously cleared to H'00.

RTCOR is write-disabled when the PSRAME bit or DRAME bit is set to 1. RTCOR is initialized to H'FF by a reset and in hardware standby mode. In software standby mode it retains its previous value.

7.3 Operation

7.3.1 Overview

One of three functions can be selected for the H8/3052BF refresh controller: interfacing to DRAM connected to area 3, interfacing to pseudo-static RAM connected to area 3, or interval timing. Table 7.3 summarizes the register settings when these three functions are used.

Table 7.3 Refresh Controller Settings

		Usage		
Register Settings		**DRAM Interface**	**PSRAM Interface**	**Interval Timer**
RFSHCR	SRFMD	Selects self-refresh mode	Selects self-refresh mode	Cleared to 0
	PSRAME	Cleared to 0	Set to 1	Cleared to 0
	DRAME	Set to 1	Cleared to 0	Cleared to 0
	CAS/$\overline{WE}$	Selects 2$\overline{CAS}$ or 2$\overline{WE}$ mode	—	—
	M9/$\overline{M8}$	Selects column addressing mode	—	—
	RFSHE	Selects $\overline{RFSH}$ signal output	Selects $\overline{RFSH}$ signal output	Cleared to 0
	RCYCE	Selects insertion of refresh cycles	Selects insertion of refresh cycles	—
RTCOR		Refresh interval setting	Refresh interval setting	Interrupt interval setting
RTMCSR	CKS2 to CKS0			
	CMF	Set to 1 when RTCNT = RTCOR	Set to 1 when RTCNT = RTCOR	Set to 1 when RTCNT = RTCOR
	CMIE	Cleared to 0	Cleared to 0	Enables or disables interrupt requests
P8DDR	$P8_1$DDR	Set to 1 ($\overline{CS_3}$ output)	Set to 1 ($\overline{CS_3}$ output)	Set to 0 or 1
ABWCR	ABW3	Cleared to 0	—	—

DRAM Interface: To set up area 3 for connection to 16-bit-wide DRAM, initialize RTCOR, RTMCSR, and RFSHCR in that order, clearing bit PSRAME to 0 and setting bit DRAME to 1. Set bit $P8_1DDR$ to 1 in the port 8 data direction register (P8DDR) to enable $\overline{CS}_3$ output. In ABWCR, make area 3 a 16-bit-access area.

Pseudo-Static RAM Interface: To set up area 3 for connection to pseudo-static RAM, initialize RTCOR, RTMCSR, and RFSHCR in that order, setting bit PSRAME to 1 and clearing bit DRAME to 0. Set bit $P8_1DDR$ to 1 in P8DDR to enable $\overline{CS}_3$ output.

Interval Timer: When PSRAME = 0 and DRAME = 0, the refresh controller operates as an interval timer. After setting RTCOR, select an input clock in RTMCSR and set the CMIE bit to 1. CMI interrupts will be requested at compare match intervals determined by RTCOR and bits CKS2 to CKS0 in RTMCSR.

When setting RTCOR, RTMCSR, and RFSHCR, make sure that PSRAME = 0 and DRAME = 0. Writing is disabled when either of these bits is set to 1.

7.3.2 DRAM Refresh Control

Refresh Request Interval and Refresh Cycle Execution: The refresh request interval is determined by the settings of RTCOR and bits CKS2 to CKS0 in RTMCSR. Figure 7.2 illustrates the refresh request interval.

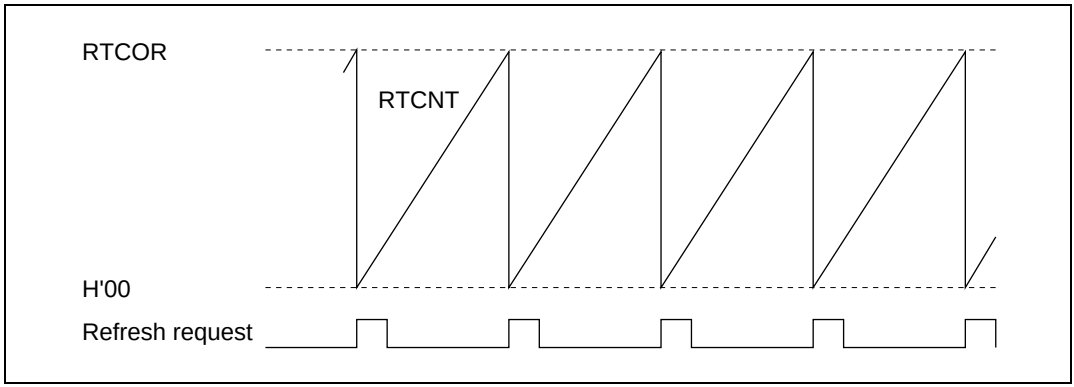


Figure 7.2 Refresh Request Interval (RCYCE = 1)

Refresh requests are generated at regular intervals as shown in figure 7.2, but the refresh cycle is not actually executed until the refresh controller gets the bus right.

Table 7.4 summarizes the relationship among area 3 settings, DRAM read/write cycles, and refresh cycles.

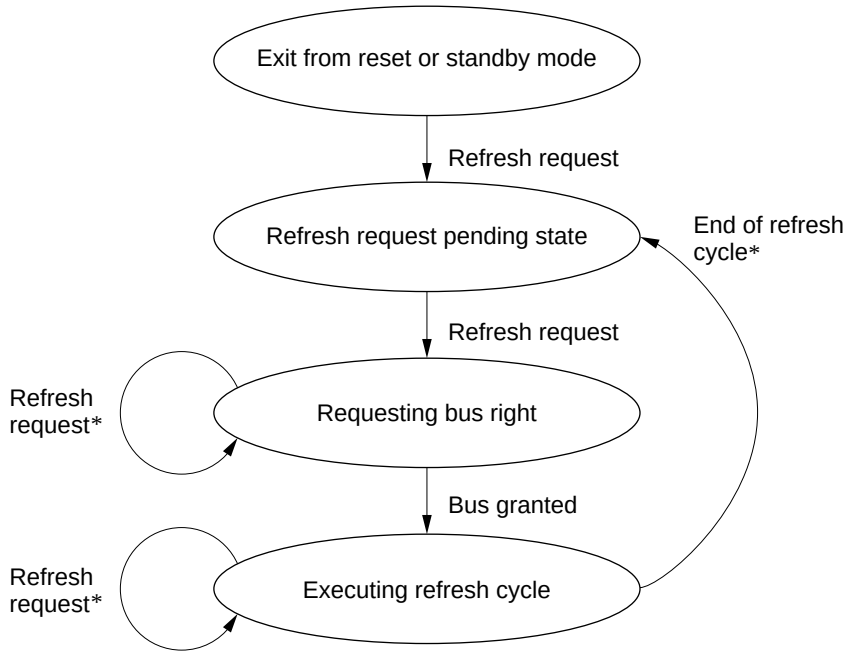
Table 7.4 Area 3 Settings, DRAM Access Cycles, and Refresh Cycles

Area 3 Settings	Read/Write Cycle by CPU or DMAC	Refresh Cycle
2-state-access area (AST3 = 0)	• 3 states • Wait states cannot be inserted	• 3 states • Wait states cannot be inserted
3-state-access area (AST3 = 1)	• 3 states • Wait states can be inserted	• 3 states • Wait states can be inserted

To insert refresh cycles, set the RCYCE bit to 1 in RFSHCR. Figure 7.3 shows the state transitions for execution of refresh cycles.

When the first refresh request occurs after exit from the reset state or standby mode, the refresh controller does not execute a refresh cycle, but goes into the refresh request pending state. Note this point when using a DRAM that requires a refresh cycle for initialization.

When a refresh request occurs in the refresh request pending state, the refresh controller acquires the bus right, then executes a refresh cycle. If another refresh request occurs during execution of the refresh cycle, it is ignored.



Note: * A refresh request is ignored if it occurs while the refresh controller is requesting the bus right or executing a refresh cycle.

Figure 7.3 State Transitions for Refresh Cycle Execution

Address Multiplexing: Address multiplexing depends on the setting of the M9/$\overline{M8}$ bit in RFSHCR, as described in table 7.5. Figure 7.4 shows the address output timing. Address output is multiplexed only in area 3.

Table 7.5 Address Multiplexing

Address Pins		A_{23} to A_{10}	A_9	A_8	A_7	A_6	A_5	A_4	A_3	A_2	A_1	A_0
Address signals during row address output		A_{23} to A_{10}	A_9	A_8	A_7	A_6	A_5	A_4	A_3	A_2	A_1	A_0
Address signals during column address output	M9/$\overline{M8}$ = 0	A_{23} to A_{10}	A_9	A_9	A_{16}	A_{15}	A_{14}	A_{13}	A_{12}	A_{11}	A_{10}	A_0
	M9/$\overline{M8}$ = 1	A_{23} to A_{10}	A_{18}	A_{17}	A_{16}	A_{15}	A_{14}	A_{13}	A_{12}	A_{11}	A_{10}	A_0

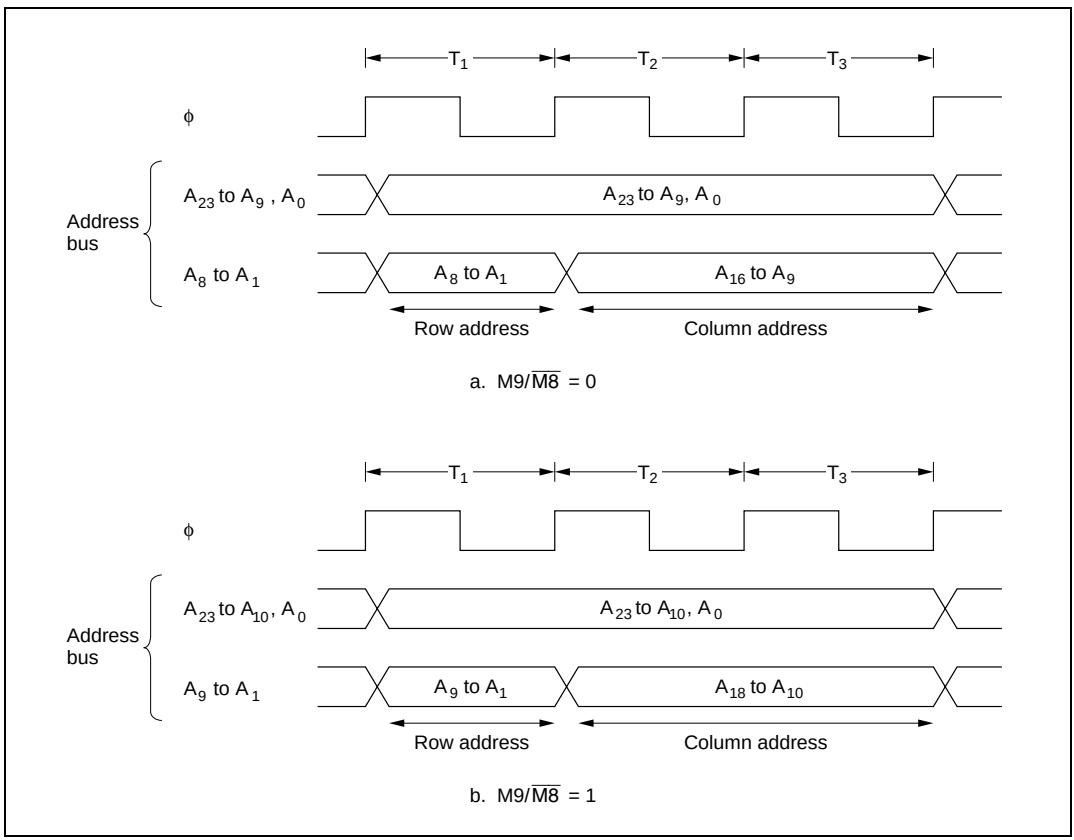


Figure 7.4 Multiplexed Address Output (Example without Wait States)

2$\overline{\text{CAS}}$ and 2$\overline{\text{WE}}$ Modes: The CAS/$\overline{\text{WE}}$ bit in RFSHCR can select two control modes for 16-bit-wide DRAM: one using $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$; the other using $\overline{\text{UW}}$ and $\overline{\text{LW}}$. These DRAM pins correspond to H8/3052BF pins as shown in table 7.6.

Table 7.6 DRAM Pins and H8/3052BF Pins

	DRAM Pin	
H8/3052BF Pin	**CAS/$\overline{\text{WE}}$ = 0 (2$\overline{\text{WE}}$ Mode)**	**CAS/$\overline{\text{WE}}$ = 1 (2$\overline{\text{CAS}}$ Mode)**
$\overline{\text{HWR}}$	$\overline{\text{UW}}$	$\overline{\text{UCAS}}$
$\overline{\text{LWR}}$	$\overline{\text{LW}}$	$\overline{\text{LCAS}}$
$\overline{\text{RD}}$	$\overline{\text{CAS}}$	$\overline{\text{WE}}$
$\overline{\text{CS}}_3$	$\overline{\text{RAS}}$	$\overline{\text{RAS}}$

Figure 7.5 (1) shows the interface timing for 2$\overline{\text{WE}}$ DRAM. Figure 7.5 (2) shows the interface timing for 2$\overline{\text{CAS}}$ DRAM.

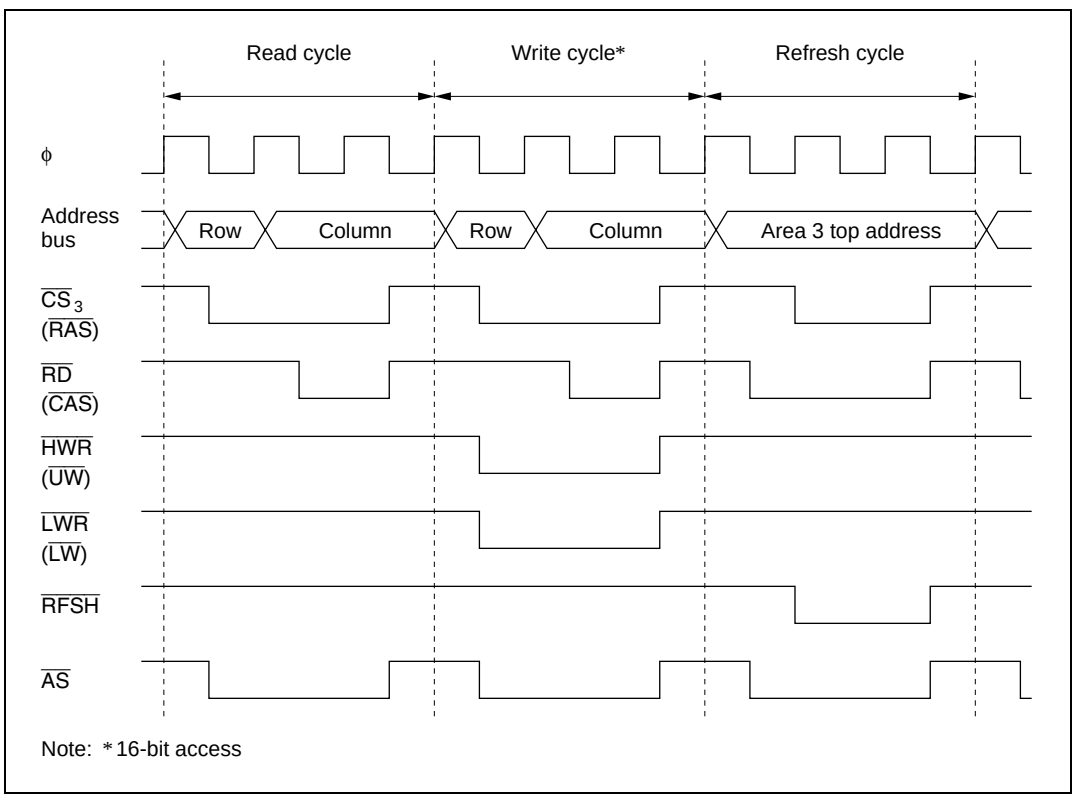

Figure 7.5 DRAM Control Signal Output Timing (1) (2$\overline{\text{WE}}$ Mode)

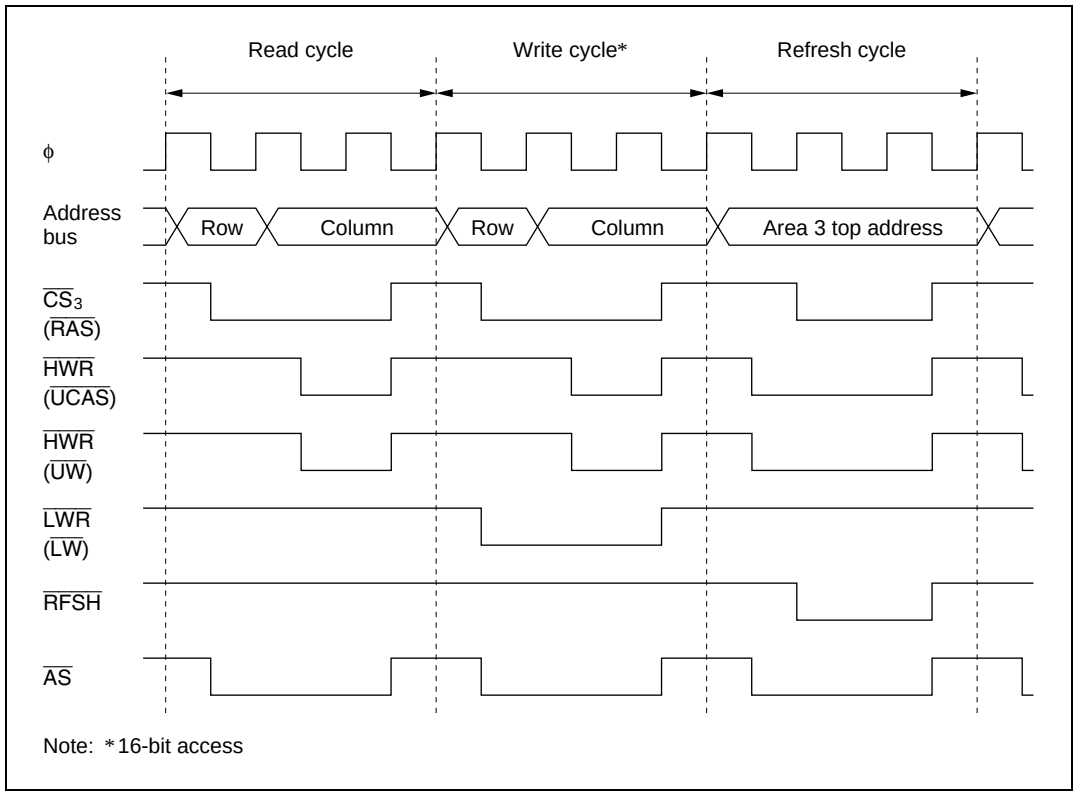

Figure 7.5 DRAM Control Signal Output Timing (2) (2$\overline{\text{CAS}}$ Mode)

Refresh Cycle Priority Order: When there are simultaneous bus requests, the priority order is:

(High) External bus master > refresh controller > DMA controller > CPU (Low)

For details see section 6.3.7, Bus Arbiter Operation.

Wait State Insertion: When bit AST3 is set to 1 in ASTCR, bus controller settings can cause wait states to be inserted into bus cycles and refresh cycles. For details see section 6.3.5, Wait Modes.

Self-Refresh Mode: Some DRAM devices have a self-refresh function. After the SRFMD bit is set to 1 in RFSHCR, when a transition to software standby mode occurs, the $\overline{CAS}$ and $\overline{RAS}$ outputs go low in that order so that the DRAM self-refresh function can be used. On exit from software standby mode, the $\overline{CAS}$ and $\overline{RAS}$ outputs both go high.

Table 7.7 shows the pin states in software standby mode. Figure 7.6 shows the signal output timing.

Table 7.7 Pin States in Software Standby Mode (PSRAME = 0, DRAME = 1)

	Software Standby Mode			
	SRFMD = 0		SRFMD = 1 (self-refresh mode)	
Signal	**CAS/$\overline{WE}$ = 0**	**CAS/$\overline{WE}$ = 1**	**CAS/$\overline{WE}$ = 0**	**CAS/$\overline{WE}$ = 1**
$\overline{HWR}$	High-impedance	High-impedance	High	Low
$\overline{LWR}$	High-impedance	High-impedance	High	Low
$\overline{RD}$	High-impedance	High-impedance	Low	High
$\overline{CS_3}$	High	High	Low	Low
$\overline{RFSH}$	High	High	Low	Low

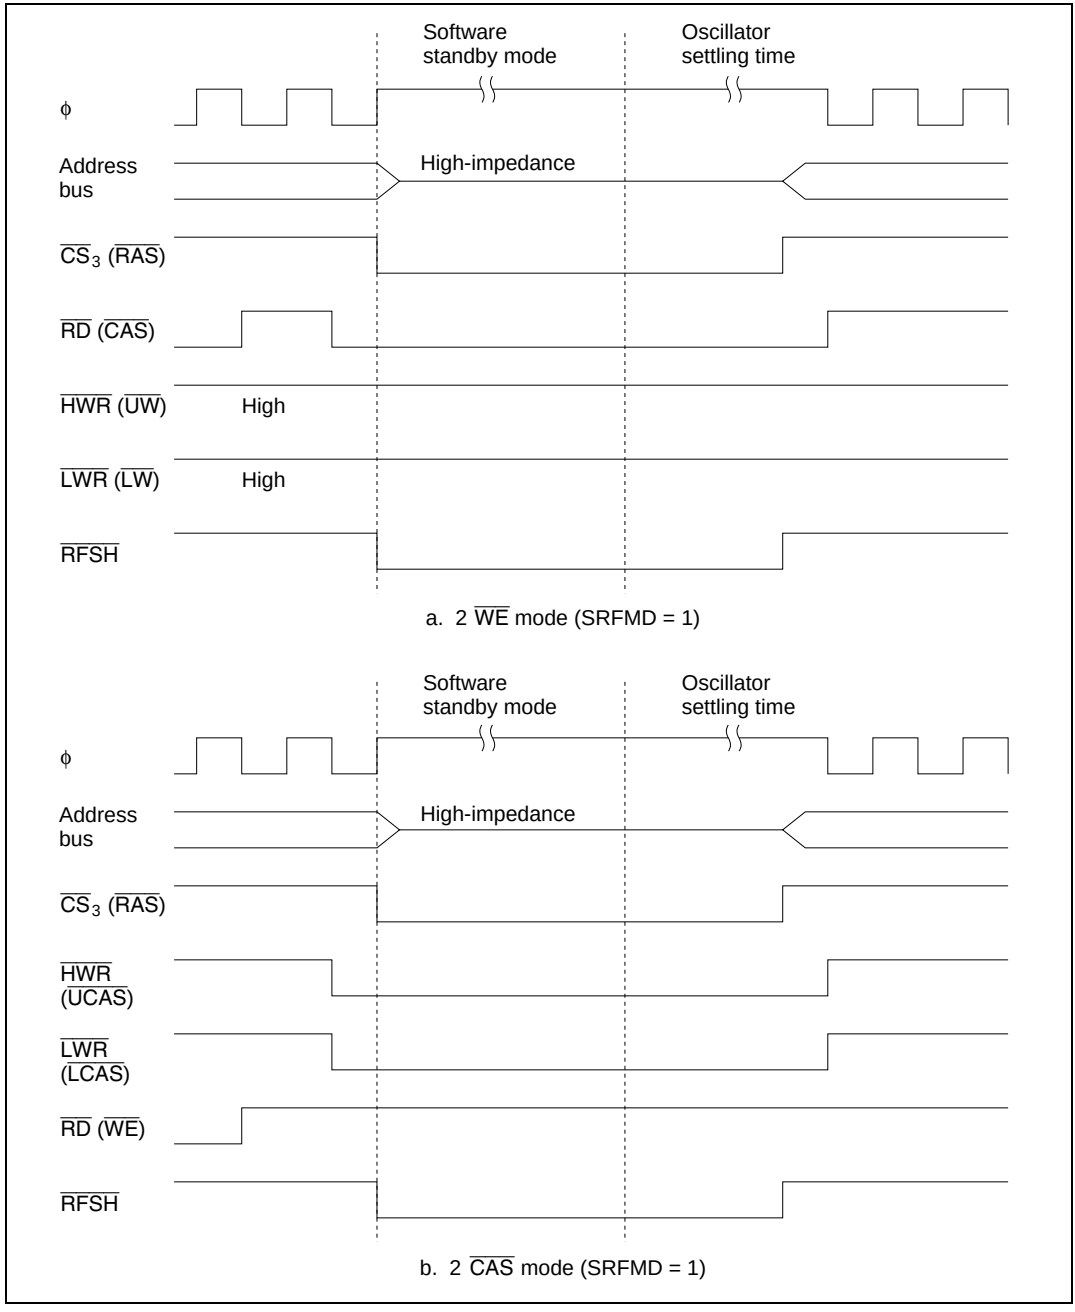

Figure 7.6 Signal Output Timing in Self-Refresh Mode (PSRAME = 0, DRAME = 1)

Operation in Power-Down State: The refresh controller operates in sleep mode. It does not operate in hardware standby mode. In software standby mode RTCNT is initialized, but RFSHCR, RTMCSR bits 5 to 3, and RTCOR retain their settings prior to the transition to software standby mode.

Example 1: Connection to 2$\overline{\text{WE}}$ 1-Mbit DRAM (1-Mbyte Mode): Figure 7.7 shows typical interconnections to a 2$\overline{\text{WE}}$ 1-Mbit DRAM, and the corresponding address map. Figure 7.8 shows a setup procedure to be followed by a program for this example. After power-up the DRAM must be refreshed to initialize its internal state. Initialization takes a certain length of time, which can be measured by using an interrupt from another timer module, or by counting the number of times RTMCSR bit 7 (CMF) is set. Note that no refresh cycle is executed for the first refresh request after exit from the reset state or standby mode (the first time the CMF flag is set; see figure 7.3). When using this example, check the DRAM device characteristics carefully and use a procedure that fits them.

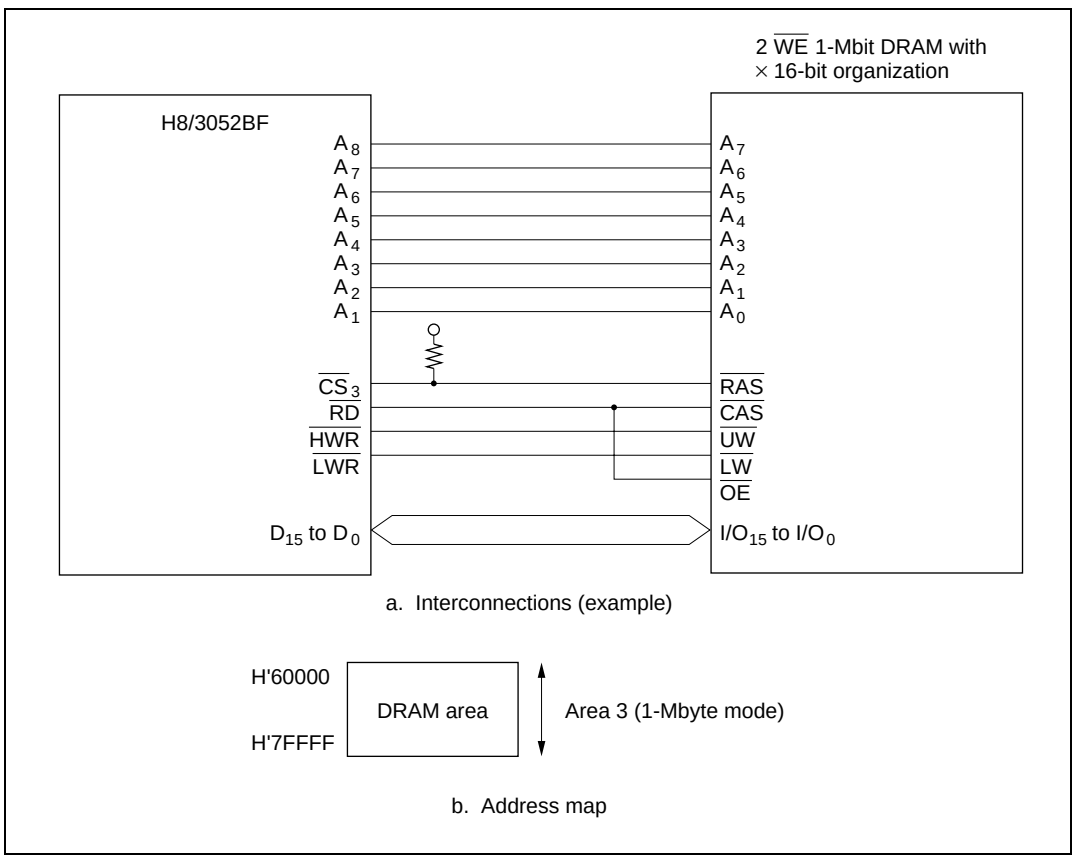

Figure 7.7 Interconnections and Address Map for 2$\overline{\text{WE}}$ 1-Mbit DRAM (Example)

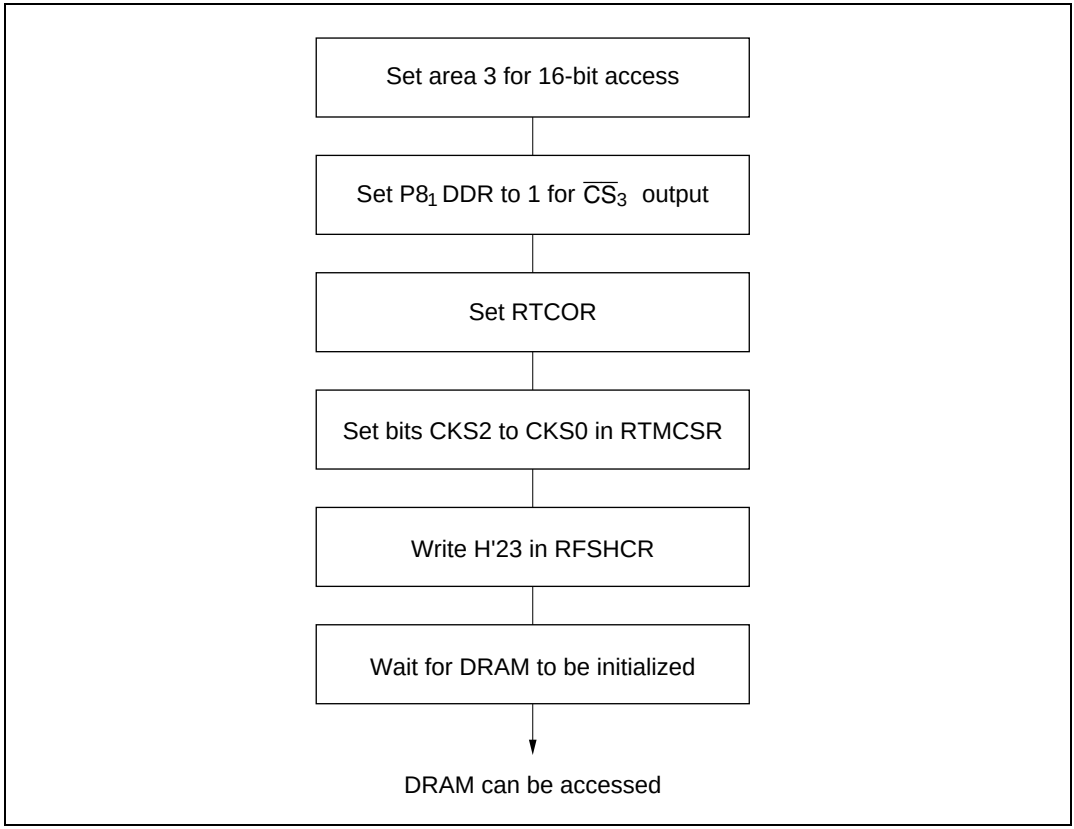

Figure 7.8 Setup Procedure for 2$\overline{WE}$ 1-Mbit DRAM (1-Mbyte Mode)

Example 2: Connection to 2$\overline{\text{WE}}$ 4-Mbit DRAM (16-Mbyte Mode): Figure 7.9 shows typical interconnections to a single 2$\overline{\text{WE}}$ 4-Mbit DRAM, and the corresponding address map. Figure 7.10 shows a setup procedure to be followed by a program for this example.

The DRAM in this example has 10-bit row addresses and 8-bit column addresses. Its address area is H'600000 to H'67FFFF.

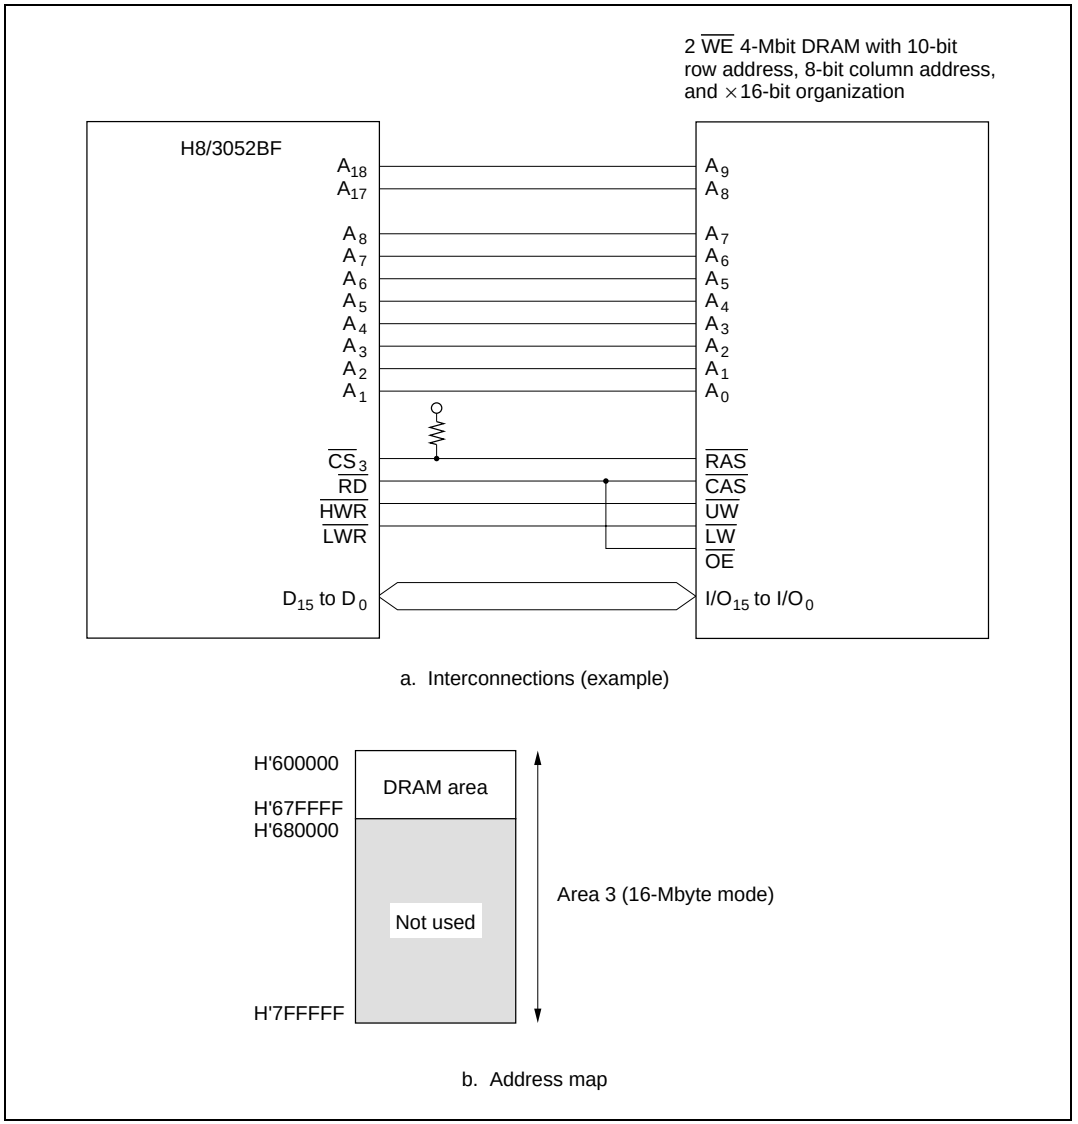

Figure 7.9 Interconnections and Address Map for 2$\overline{\text{WE}}$ 4-Mbit DRAM (Example)

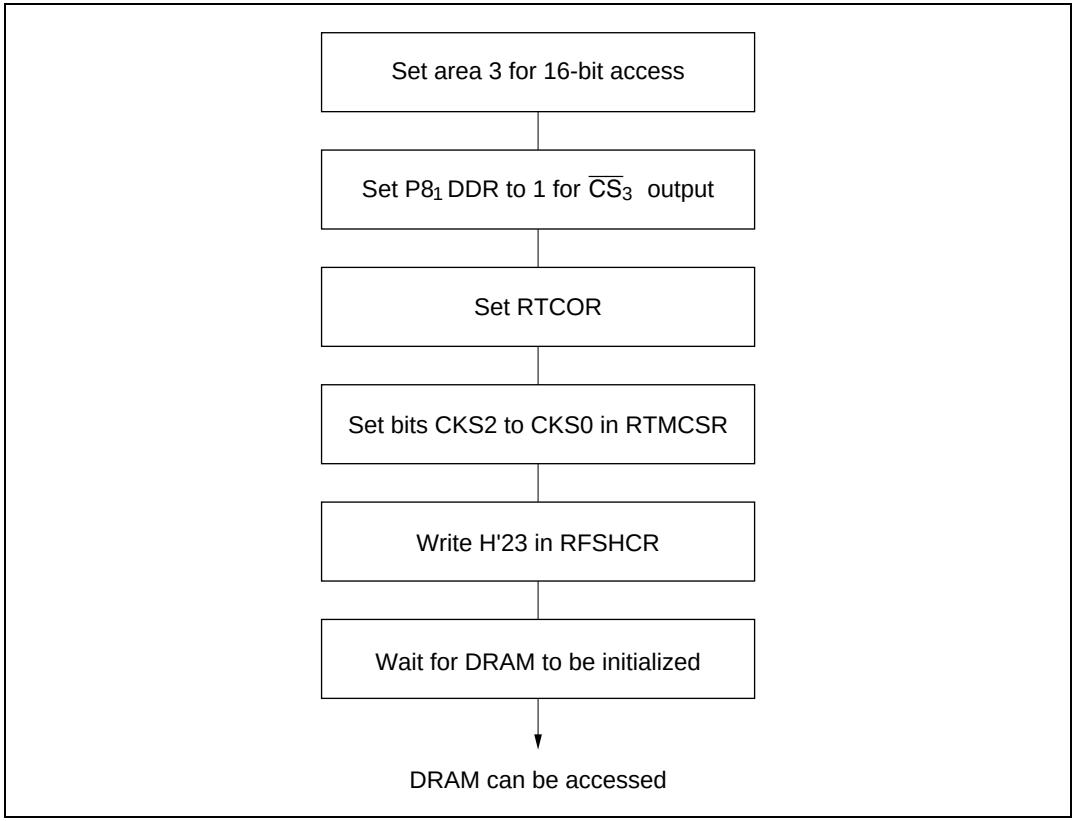

Figure 7.10 Setup Procedure for 2$\overline{WE}$ 4-Mbit DRAM with 10-Bit Row Address and 8-Bit Column Address (16-Mbyte Mode)

Example 3: Connection to 2$\overline{\text{CAS}}$ 4-Mbit DRAM (16-Mbyte Mode): Figure 7.11 shows typical interconnections to a single 2$\overline{\text{CAS}}$ 4-Mbit DRAM, and the corresponding address map.

Figure 7.12 shows a setup procedure to be followed by a program for this example.

The DRAM in this example has 9-bit row addresses and 9-bit column addresses. Its address area is H'600000 to H'67FFFF.

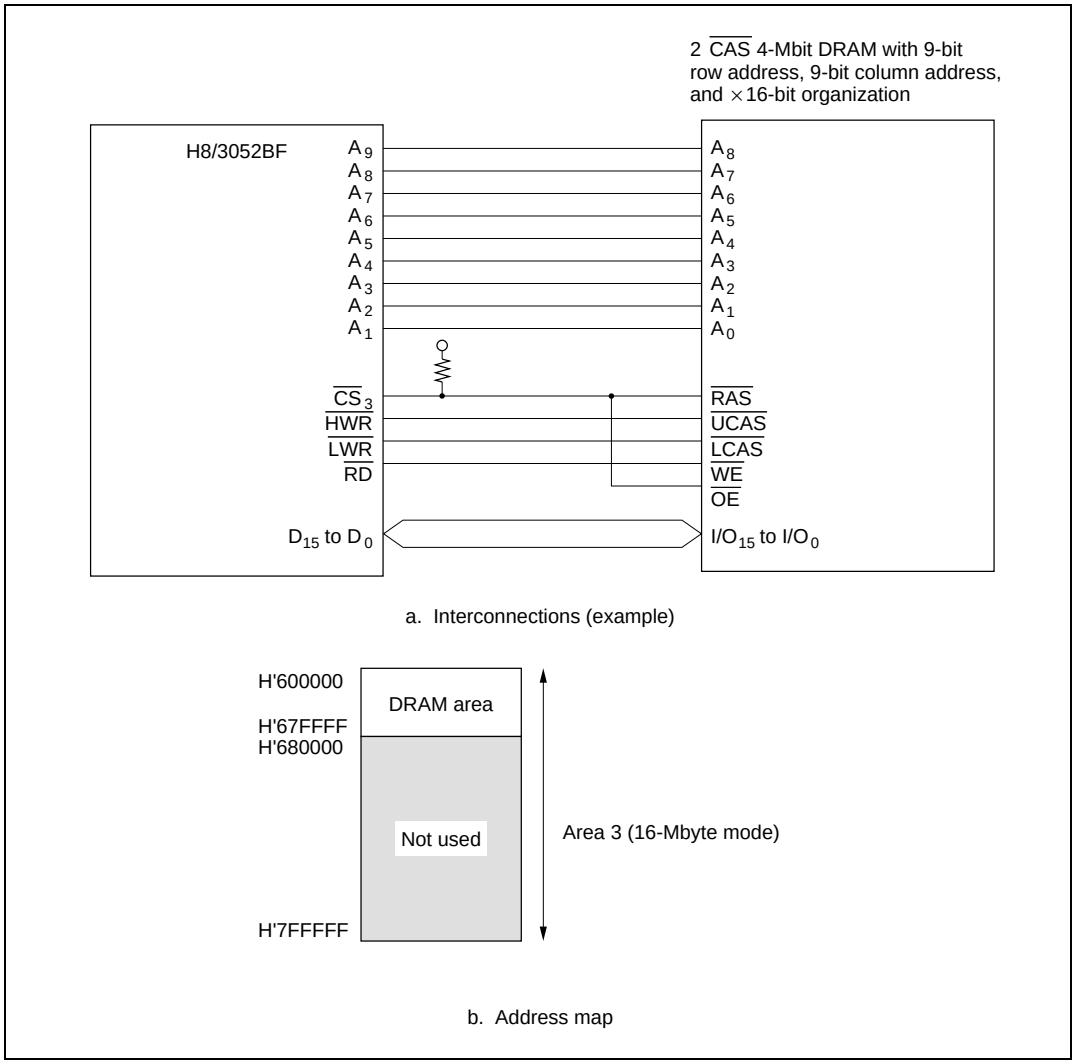

Figure 7.11 Interconnections and Address Map for 2$\overline{\text{CAS}}$ 4-Mbit DRAM (Example)

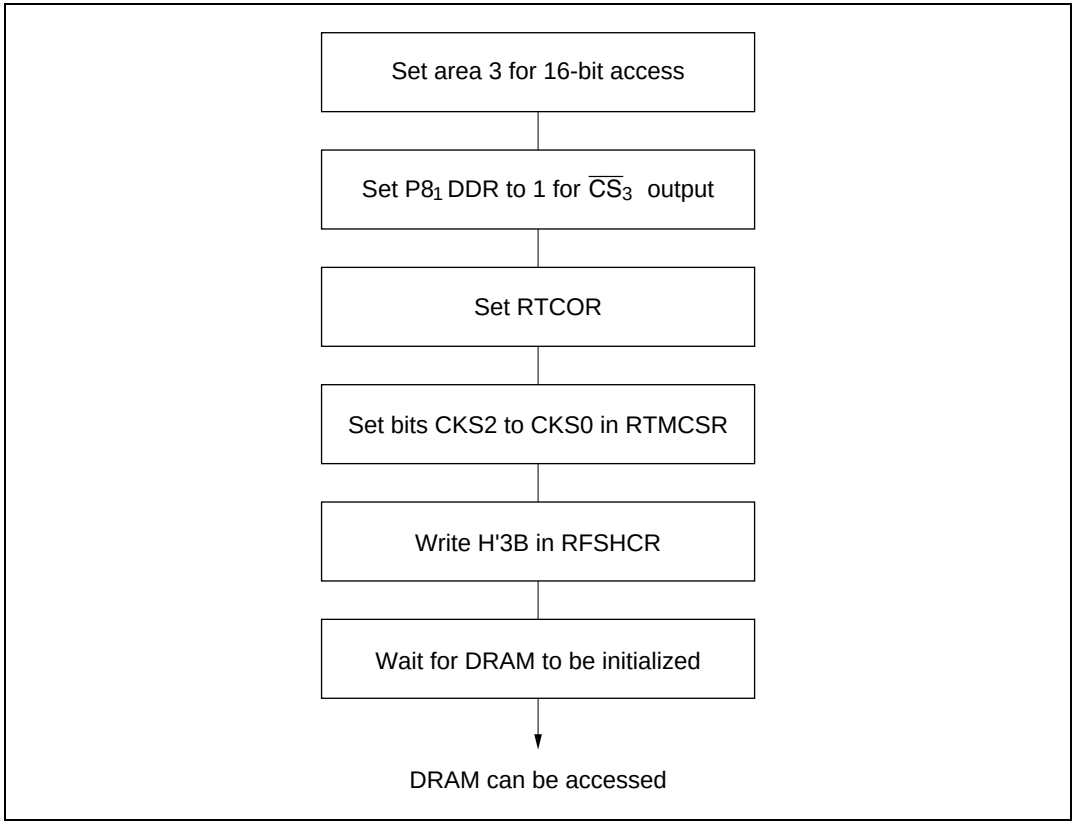

Figure 7.12 Setup Procedure for 2$\overline{CAS}$ 4-Mbit DRAM with 9-Bit Row Address and 9-Bit Column Address (16-Mbyte Mode)

Example 4: Connection to Multiple 4-Mbit DRAM Chips (16-Mbyte Mode): Figure 7.13 shows an example of interconnections to two 2$\overline{\text{CAS}}$ 4-Mbit DRAM chips, and the corresponding address map. Up to four DRAM chips can be connected to area 3 by decoding upper address bits A_{19} and A_{20}.

Figure 7.14 shows a setup procedure to be followed by a program for this example. The DRAM in this example has 9-bit row addresses and 9-bit column addresses. Both chips must be refreshed simultaneously, so the $\overline{\text{RFSH}}$ pin must be used.

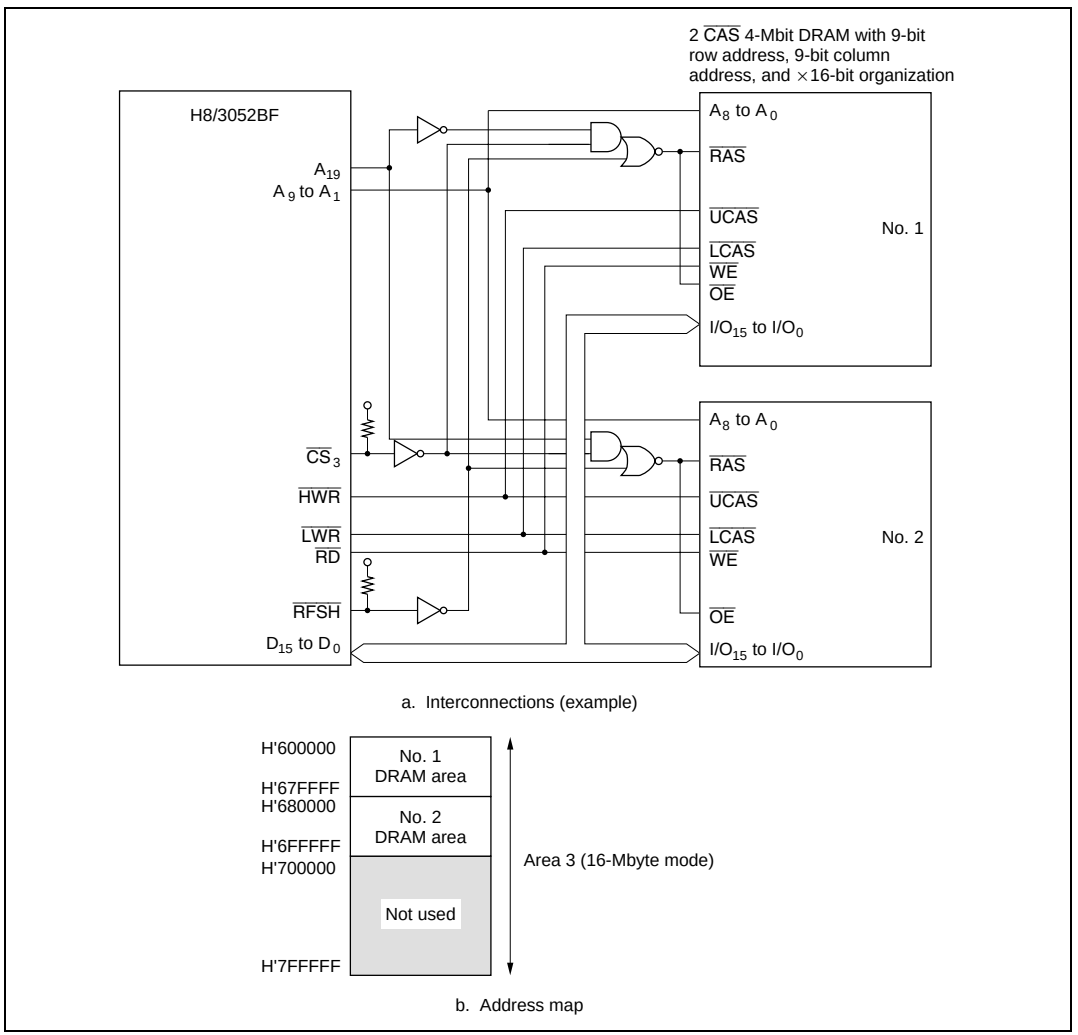

Figure 7.13 Interconnections and Address Map for Multiple 2$\overline{\text{CAS}}$ 4-Mbit DRAM Chips (Example)

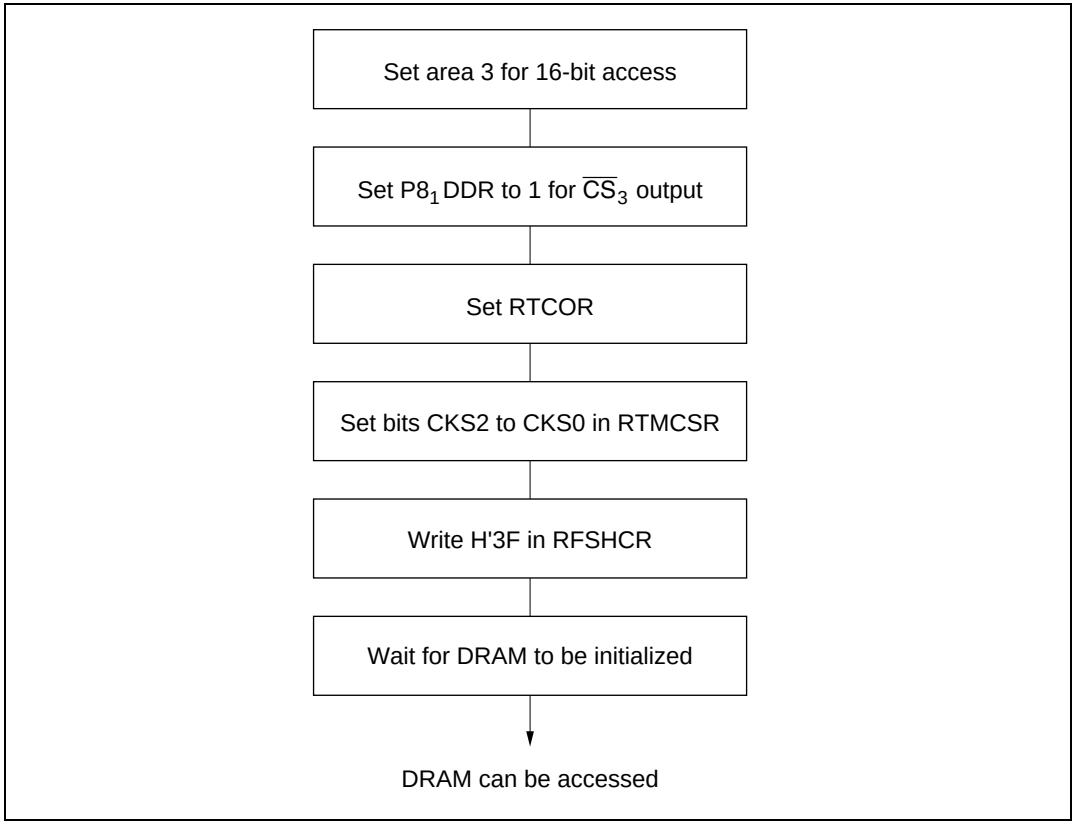

Figure 7.14 Setup Procedure for Multiple 2$\overline{CAS}$ 4-Mbit DRAM Chips with 9-Bit Row Address and 9-Bit Column Address (16-Mbyte Mode)

7.3.3 Pseudo-Static RAM Refresh Control

Refresh Request Interval and Refresh Cycle Execution: The refresh request interval is determined as in a DRAM interface, by the settings of RTCOR and bits CKS2 to CKS0 in RTMCSR. The numbers of states required for pseudo-static RAM read/write cycles and refresh cycles are the same as for DRAM (see table 7.4). The state transitions are as shown in figure 7.3.

Pseudo-Static RAM Control Signals: Figure 7.15 shows the control signals for pseudo-static RAM read, write, and refresh cycles.

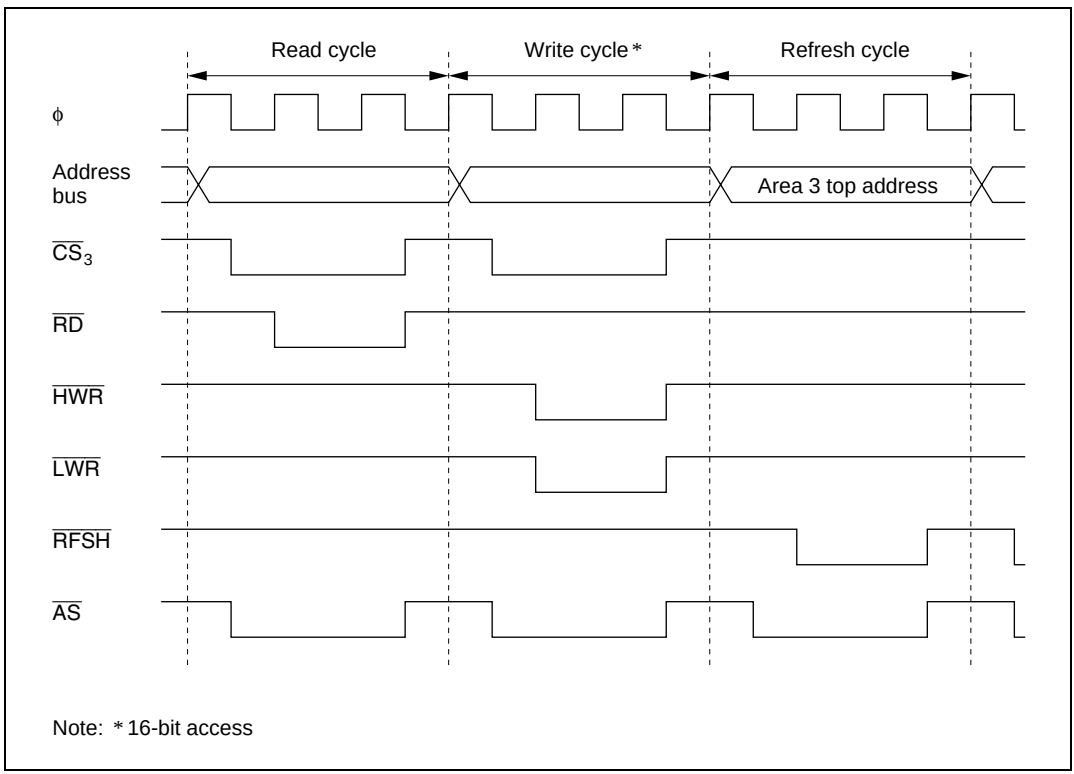

Figure 7.15 Pseudo-Static RAM Control Signal Output Timing

Refresh Cycle Priority Order: When there are simultaneous bus requests, the priority order is:

(High) External bus master > refresh controller > DMA controller > CPU (Low)

For details see section 6.3.7, Bus Arbiter Operation.

Wait State Insertion: When bit AST3 is set to 1 in ASTCR, the wait state controller (WSC) can insert wait states into bus cycles and refresh cycles. For details see section 6.3.5, Wait Modes.

Self-Refresh Mode: Some pseudo-static RAM devices have a self-refresh function. After the SRFMD bit is set to 1 in RFSHCR, when a transition to software standby mode occurs, the H8/3052BF' $\overline{CS_3}$ output goes high and its $\overline{RFSH}$ output goes low so that the pseudo-static RAM self-refresh function can be used. On exit from software standby mode, the $\overline{RFSH}$ output goes high.

Table 7.8 shows the pin states in software standby mode. Figure 7.16 shows the signal output timing.

Table 7.8 Pin States in Software Standby Mode (PSRAME = 1, DRAME = 0)

	Software Standby Mode	
Signal	**SRFMD = 0**	**SRFMD = 1 (Self-Refresh Mode)**
$\overline{CS_3}$	High	High
$\overline{RD}$	High-impedance	High-impedance
$\overline{HWR}$	High-impedance	High-impedance
$\overline{LWR}$	High-impedance	High-impedance
$\overline{RFSH}$	High	Low

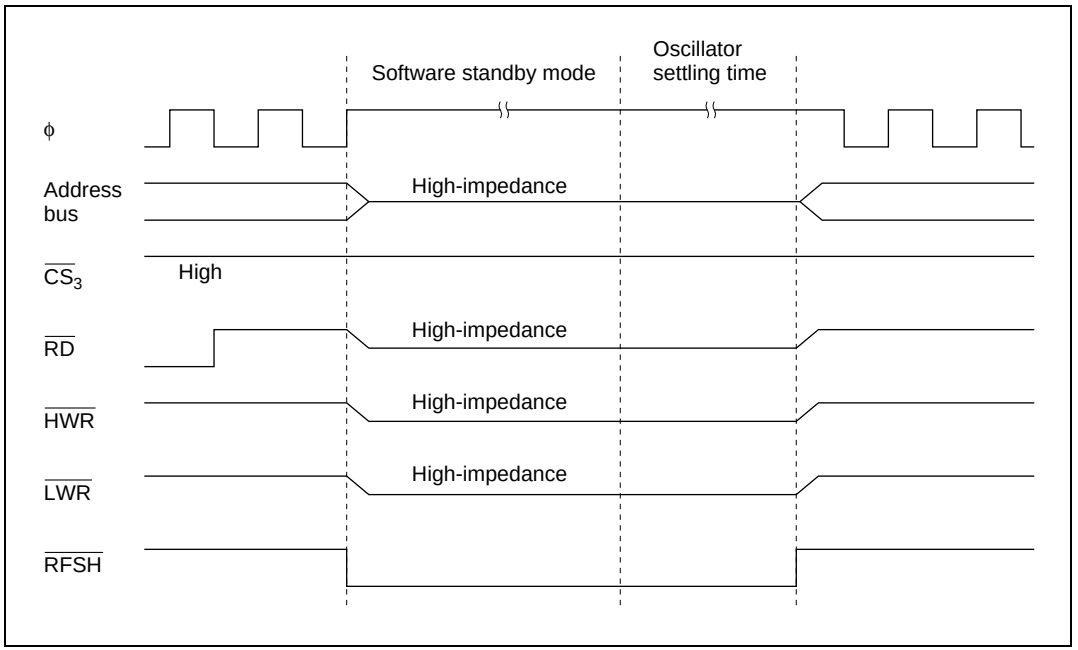

Figure 7.16 Signal Output Timing in Self-Refresh Mode (PSRAME = 1, DRAME = 0)

Operation in Power-Down State: The refresh controller operates in sleep mode. It does not operate in hardware standby mode. In software standby mode RTCNT is initialized, but RFSHCR, RTMCSR bits 5 to 3, and RTCOR retain their settings prior to the transition to software standby mode.

Example: Pseudo-static RAM may have separate $\overline{OE}$ and $\overline{RFSH}$ pins, or these may be combined into a single $\overline{OE}/\overline{RFSH}$ pin. Figure 7.17 shows an example of a circuit for generating an $\overline{OE}/\overline{RFSH}$ signal. Check the device characteristics carefully, and design a circuit that fits them. Figure 7.18 shows a setup procedure to be followed by a program.

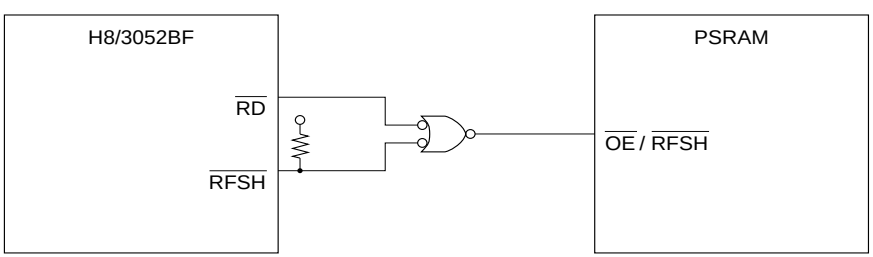

Figure 7.17 Interconnection to Pseudo-Static RAM with $\overline{OE}/\overline{RFSH}$ Signal (Example)

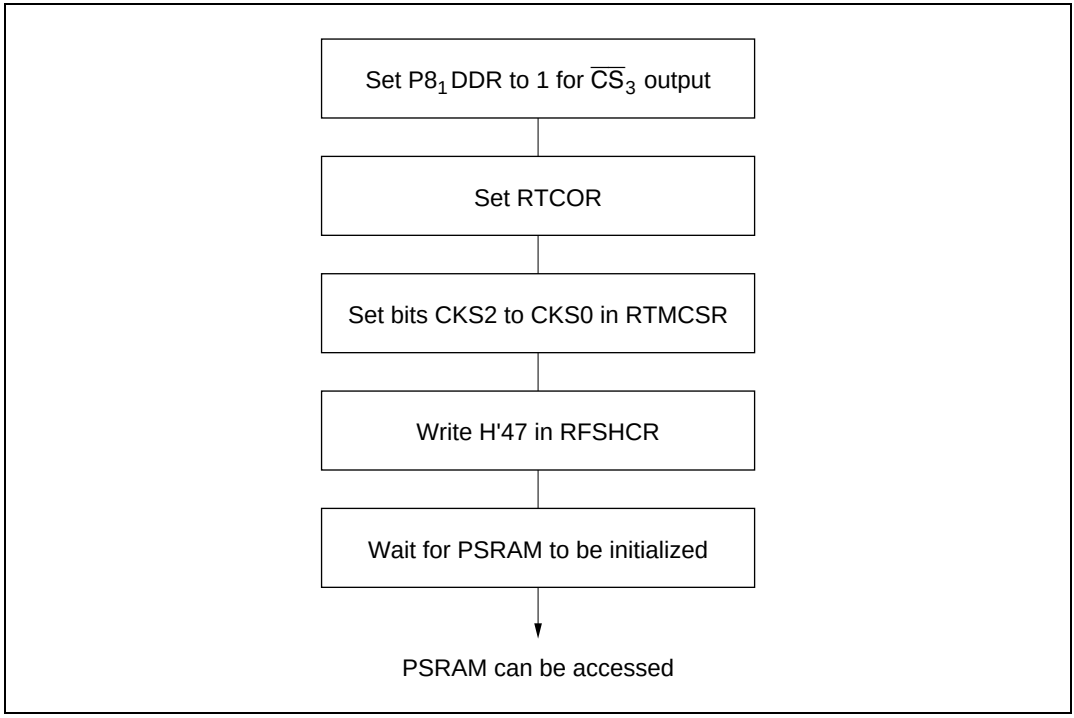

Figure 7.18 Setup Procedure for Pseudo-Static RAM

7.3.4 Interval Timer

To use the refresh controller as an interval timer, clear the PSRAME and DRAME both to 0. After setting RTCOR, select a clock source with bits CKS2 to CKS0 in RTMCSR, and set the CMIE bit to 1.

Timing of Setting of Compare Match Flag and Clearing by Compare Match: The CMF flag in RTMCSR is set to 1 by a compare match signal output when the RTCOR and RTCNT values match. The compare match signal is generated in the last state in which the values match (when RTCNT is updated from the matching value to a new value). Accordingly, when RTCNT and RTCOR match, the compare match signal is not generated until the next counter clock pulse. Figure 7.19 shows the timing.

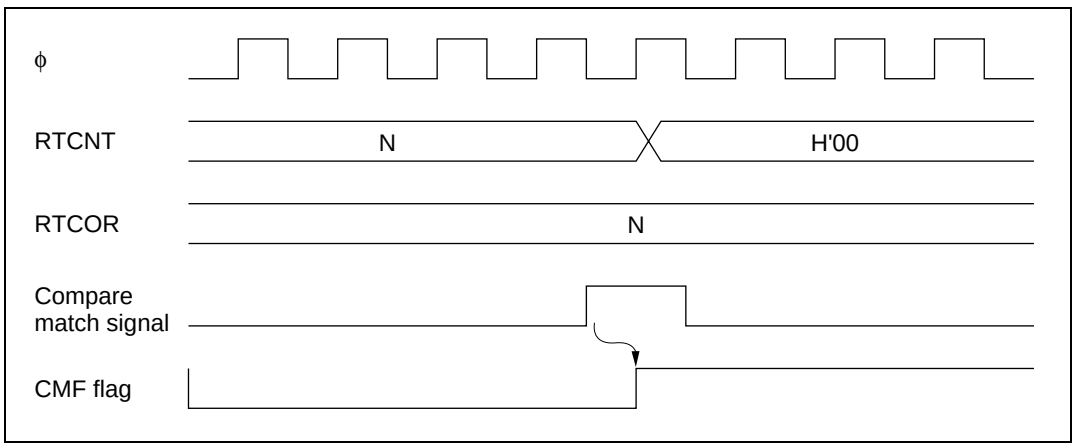

Figure 7.19 Timing of Setting of CMF Flag

Operation in Power-Down State: The interval timer function operates in sleep mode. It does not operate in hardware standby mode. In software standby mode RTCNT and RTMCSR bits 7 and 6 are initialized, but RTMCSR bits 5 to 3 and RTCOR retain their settings prior to the transition to software standby mode.

Contention between RTCNT Write and Counter Clear: If a counter clear signal occurs in the T_3 state of an RTCNT write cycle, clearing of the counter takes priority and the write is not performed. See figure 7.20.

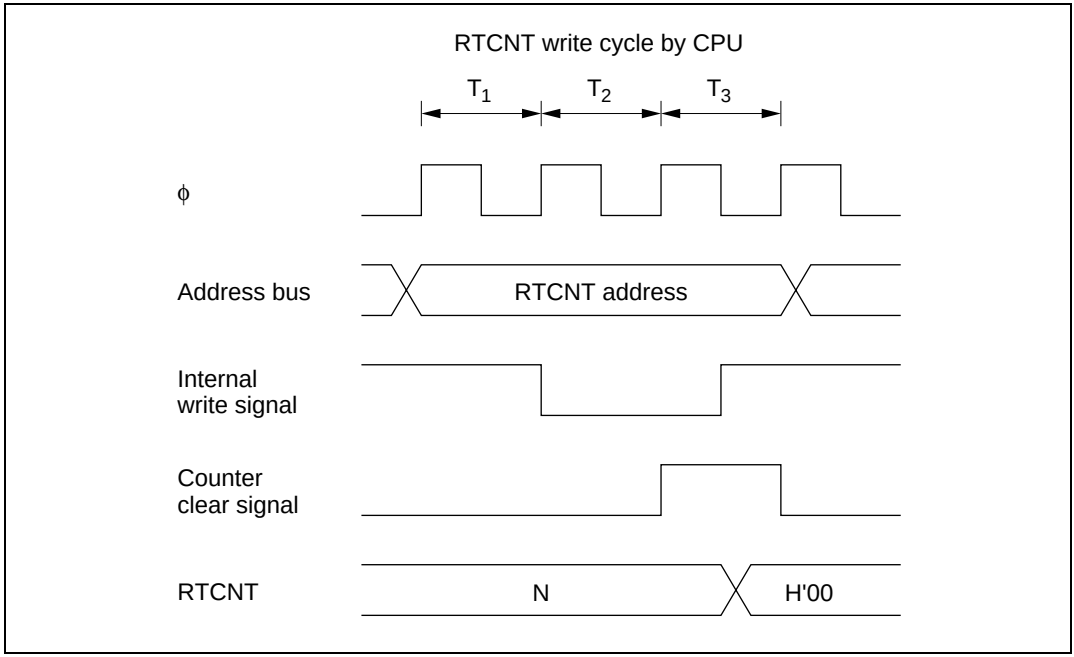

Figure 7.20 Contention between RTCNT Write and Clear

Contention between RTCNT Write and Increment: If an increment pulse occurs in the T_3 state of an RTCNT write cycle, writing takes priority and RTCNT is not incremented. See figure 7.21.

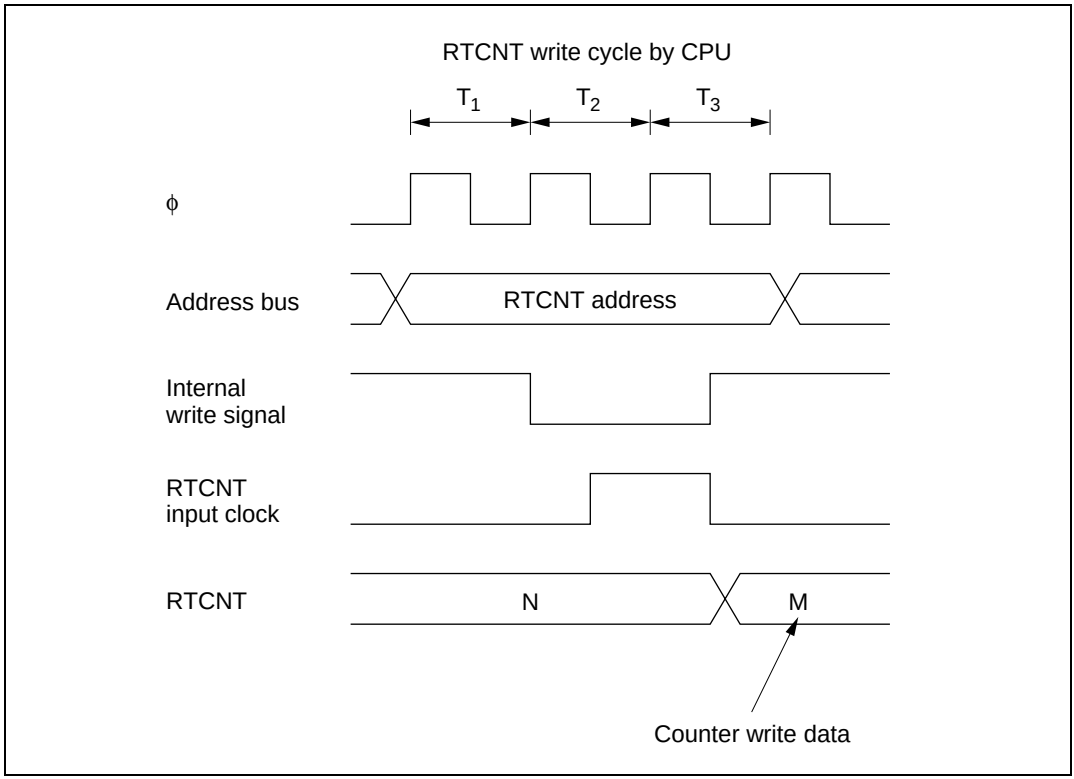

Figure 7.21 Contention between RTCNT Write and Increment

Contention between RTCOR Write and Compare Match: If a compare match occurs in the T_3 state of an RTCOR write cycle, writing takes priority and the compare match signal is inhibited. See figure 7.22.

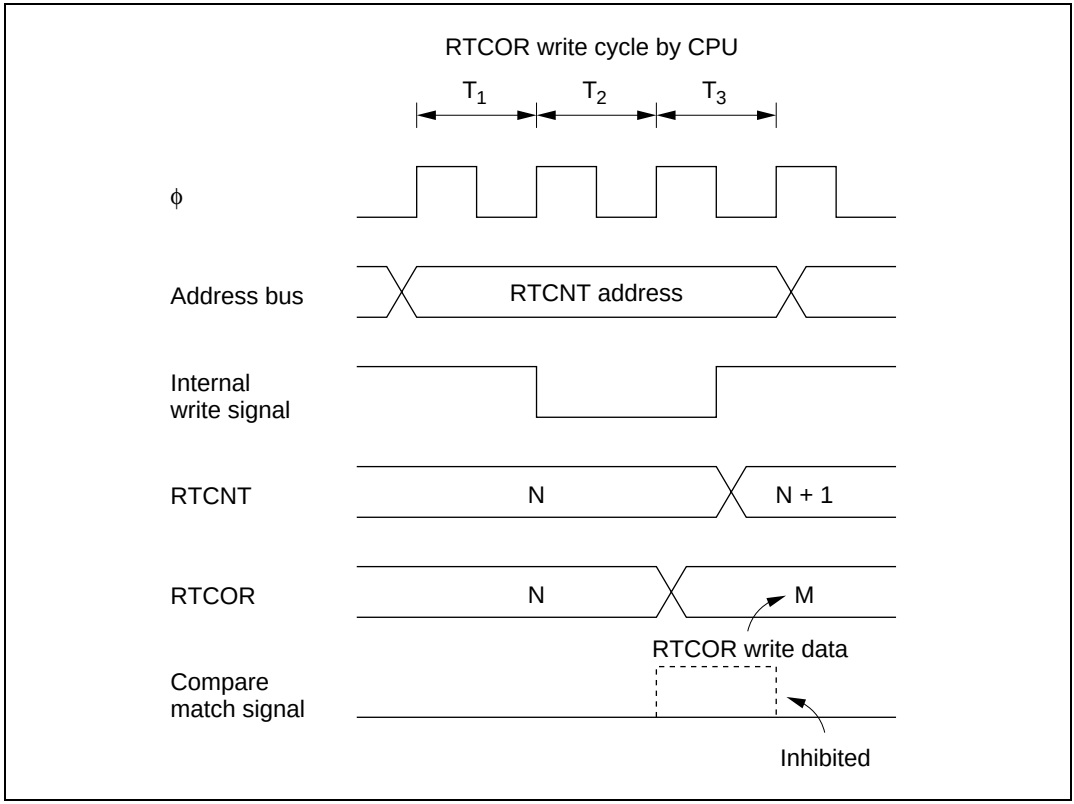

Figure 7.22 Contention between RTCOR Write and Compare Match

RTCNT Operation at Internal Clock Source Switchover: Switching internal clock sources may cause RTCNT to increment, depending on the switchover timing. Table 7.9 shows the relation between the time of the switchover (by writing to bits CKS2 to CKS0) and the operation of RTCNT.

The RTCNT input clock is generated from the internal clock source by detecting the falling edge of the internal clock. If a switchover is made from a high clock source to a low clock source, as in case No. 3 in table 7.9, the switchover will be regarded as a falling edge, an RTCNT clock pulse will be generated, and RTCNT will be incremented.

Table 7.9 Internal Clock Switchover and RTCNT Operation

No.	CKS2 to CKS0 Write Timing	RTCNT Operation
1	Low → low switchover*1	2	Low → high switchover*2	
No.	CKS2 to CKS0 Write Timing	RTCNT Operation
3	High → low switchover*3	4	High → high switchover	
Notes: 1. Including switchovers from a low clock source to the halted state, and from the halted state to a low clock source.
2. Including switchover from the halted state to a high clock source.
3. Including switchover from a high clock source to the halted state.
4. The switchover is regarded as a falling edge, causing RTCNT to increment.

7.4 Interrupt Source

Compare match interrupts (CMI) can be generated when the refresh controller is used as an interval timer. Compare match interrupt requests are masked/unmasked with the CMIE bit of RTMCSR.

7.5 Usage Notes

When using the DRAM or pseudo-static RAM refresh function, note the following points:

With the refresh controller, if directly connected DRAM or PSRAM is disconnected*, the $P8_0/\overline{RFSH}/\overline{IRQ_0}$ pin and the $P8_1/\overline{CS_3}/\overline{IRQ_1}$ pin may both become low-level outputs simultaneously.

Note: * When the DRAM enable bit (DRAME) or PSRAM enable bit (PSRAME) in the refresh control register (RFSHCR) is cleared to 0 after being set to 1.

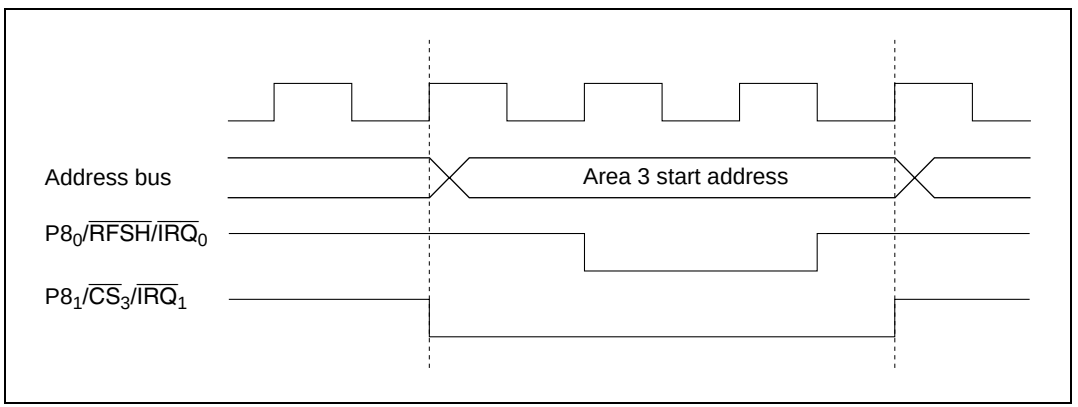

Figure 7.23 Operation when DRAM/PSRAM Connection Is Switched

Refresh cycles are not executed while the bus is released, during software standby mode, and when a bus cycle is greatly prolonged by insertion of wait states. When these conditions occur, other means of refreshing are required.

If refresh requests occur while the bus is released, the first request is held and one refresh cycle is executed after the bus-released state ends. Figure 7.24 shows the bus cycles in this case.

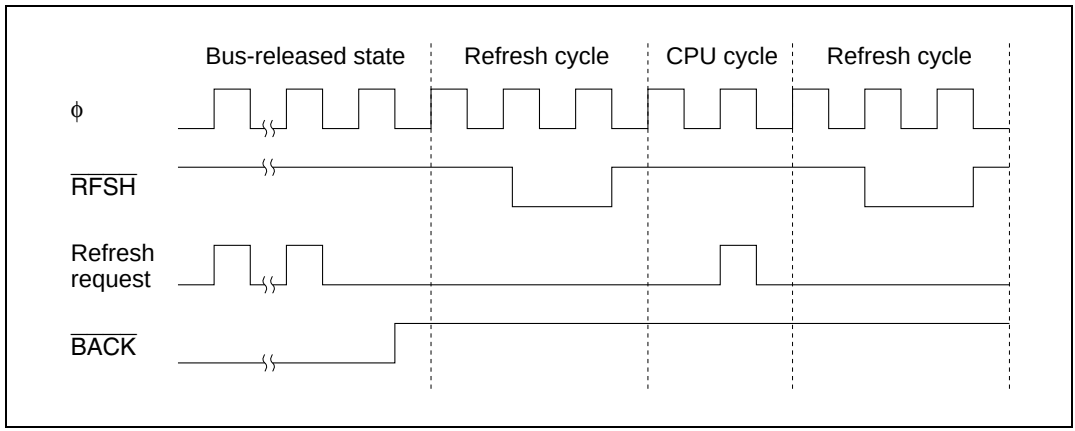

Figure 7.24 Refresh Cycles when Bus Is Released

If a bus cycle is prolonged by insertion of wait states, the first refresh request is held, as in the bus-released state.

If there is contention with a bus request from an external bus master when making a transition to software standby mode, a one-state bus-released state may occur immediately before the transition to software standby mode (see figure 7.25).

When using software standby mode, clear the BRLE bit to 0 in BRCR before executing the SLEEP instruction.

When making a transition to self-refresh mode, the strobe waveform output may not be guaranteed due to the same kind of contention. This, too, can be prevented by clearing the BRLE bit to 0 in BRCR.

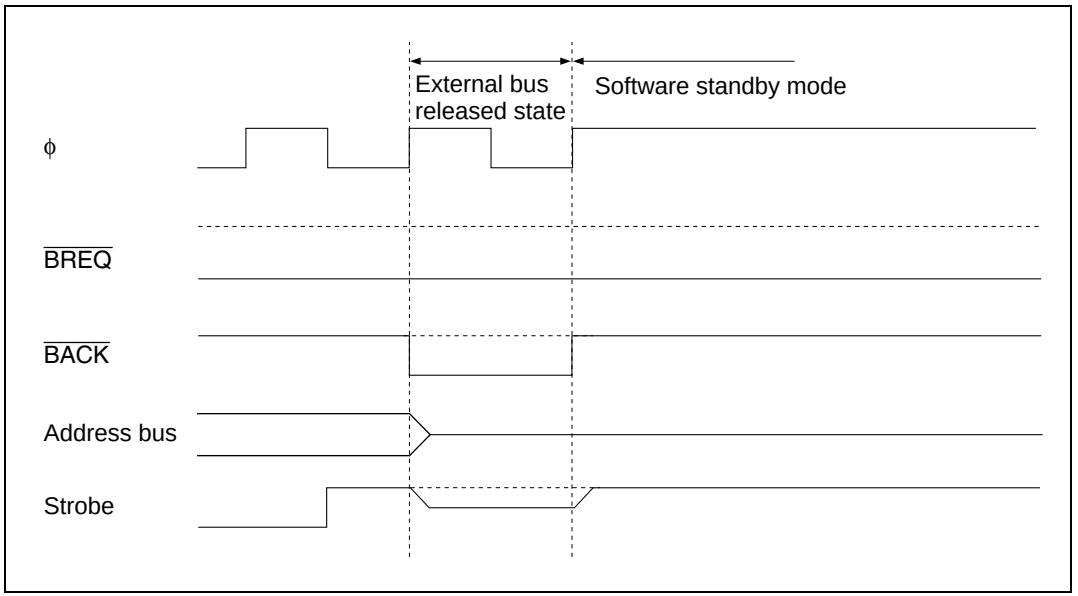

Figure 7.25 Contention between Bus-Released State and Software Standby Mode

Section 8 DMA Controller

8.1 Overview

The H8/3052BF has an on-chip DMA controller (DMAC) that can transfer data on up to four channels.

When the DMA controller is not used, it can be independently halted to conserve power. For details see section 20.6, Module Standby Function.

8.1.1 Features

DMAC features are listed below.

- Selection of short address mode or full address mode
  Short address mode
  - 8-bit source address and 24-bit destination address, or vice versa
  - Maximum four channels available
  - Selection of I/O mode, idle mode, or repeat mode

  Full address mode
  - 24-bit source and destination addresses
  - Maximum two channels available
  - Selection of normal mode or block transfer mode
- Directly addressable 16-Mbyte address space
- Selection of byte or word transfer
- Activation by internal interrupts, external requests, or auto-request (depending on transfer mode)
  - 16-bit integrated timer unit (ITU) compare match/input capture interrupts (four)
  - Serial communication interface (SCI channel 0) transmit-data-empty/receive-data-full interrupts
  - External requests
  - Auto-request

8.1.2 Block Diagram

Figure 8.1 shows a DMAC block diagram.

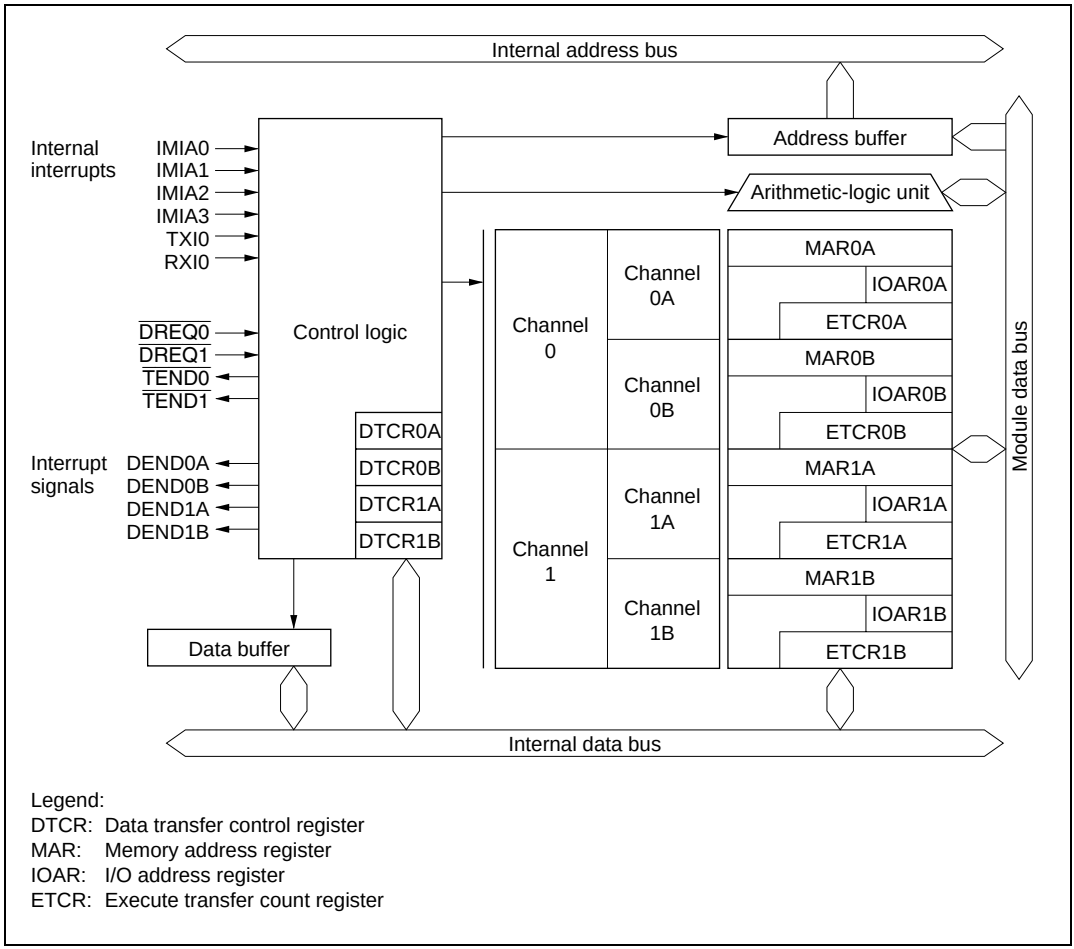

Figure 8.1 Block Diagram of DMAC

8.1.3 Functional Overview

Table 8.1 gives an overview of the DMAC functions.

Table 8.1 DMAC Functional Overview

Transfer Mode		Activation	Address Reg. Length	
			Source	Destination
Short address mode	I/O mode • Transfers one byte or one word per request • Increments or decrements the memory address by 1 or 2 • Executes 1 to 65,536 transfers	• Compare match/ input capture A interrupts from ITU channels 0 to 3 • Transmit-data-empty interrupt from SCI channel 0	24	8
	Idle mode • Transfers one byte or one word per request • Holds the memory address fixed • Executes 1 to 65,536 transfers	• Receive-data-full interrupt from SCI channel 0	8	24
		• External request	24	8
	Repeat mode • Transfers one byte or one word per request • Increments or decrements the memory address by 1 or 2 • Executes a specified number (1 to 255) of transfers, then returns to the initial state and continues			

Transfer Mode		Activation	Address Reg. Length	
			Source	Destination
Full address mode	Normal mode • Auto-request — Retains the transfer request internally — Executes a specified number (1 to 65,536) of transfers continuously — Selection of burst mode or cycle-steal mode • External request — Transfers one byte or one word per request — Executes 1 to 65,536 transfers	• Auto-request • External request	24	24
	Block transfer • Transfers one block of a specified size per request • Executes 1 to 65,536 transfers • Allows either the source or destination to be a fixed block area • Block size can be 1 to 255 bytes or words	• Compare match/ input capture A interrupts from ITU channels 0 to 3 • External request	24	24

8.1.4 Pin Configuration

Table 8.2 lists the DMAC pins.

Table 8.2 DMAC Pins

Channel	Name	Abbre-viation	Input/ Output	Function
0	DMA request 0	$\overline{DREQ_0}$	Input	External request for DMAC channel 0
	Transfer end 0	$\overline{TEND_0}$	Output	Transfer end on DMAC channel 0
1	DMA request 1	$\overline{DREQ_1}$	Input	External request for DMAC channel 1
	Transfer end 1	$\overline{TEND_1}$	Output	Transfer end on DMAC channel 1

Note: External requests cannot be made to channel A in short address mode.

8.1.5 Register Configuration

Table 8.3 lists the DMAC registers.

Table 8.3 DMAC Registers

Channel	Address*	Name	Abbreviation	R/W	Initial Value
0	H'FF20	Memory address register 0AR	MAR0AR	R/W	Undetermined
	H'FF21	Memory address register 0AE	MAR0AE	R/W	Undetermined
	H'FF22	Memory address register 0AH	MAR0AH	R/W	Undetermined
	H'FF23	Memory address register 0AL	MAR0AL	R/W	Undetermined
	H'FF26	I/O address register 0A	IOAR0A	R/W	Undetermined
	H'FF24	Execute transfer count register 0AH	ETCR0AH	R/W	Undetermined
	H'FF25	Execute transfer count register 0AL	ETCR0AL	R/W	Undetermined
	H'FF27	Data transfer control register 0A	DTCR0A	R/W	H'00
	H'FF28	Memory address register 0BR	MAR0BR	R/W	Undetermined
	H'FF29	Memory address register 0BE	MAR0BE	R/W	Undetermined
	H'FF2A	Memory address register 0BH	MAR0BH	R/W	Undetermined
	H'FF2B	Memory address register 0BL	MAR0BL	R/W	Undetermined
	H'FF2E	I/O address register 0B	IOAR0B	R/W	Undetermined
	H'FF2C	Execute transfer count register 0BH	ETCR0BH	R/W	Undetermined
	H'FF2D	Execute transfer count register 0BL	ETCR0BL	R/W	Undetermined
	H'FF2F	Data transfer control register 0B	DTCR0B	R/W	H'00
1	H'FF30	Memory address register 1AR	MAR1AR	R/W	Undetermined
	H'FF31	Memory address register 1AE	MAR1AE	R/W	Undetermined
	H'FF32	Memory address register 1AH	MAR1AH	R/W	Undetermined
	H'FF33	Memory address register 1AL	MAR1AL	R/W	Undetermined
	H'FF36	I/O address register 1A	IOAR1A	R/W	Undetermined
	H'FF34	Execute transfer count register 1AH	ETCR1AH	R/W	Undetermined
	H'FF35	Execute transfer count register 1AL	ETCR1AL	R/W	Undetermined
	H'FF37	Data transfer control register 1A	DTCR1A	R/W	H'00
	H'FF38	Memory address register 1BR	MAR1BR	R/W	Undetermined
	H'FF39	Memory address register 1BE	MAR1BE	R/W	Undetermined
	H'FF3A	Memory address register 1BH	MAR1BH	R/W	Undetermined
	H'FF3B	Memory address register 1BL	MAR1BL	R/W	Undetermined
	H'FF3E	I/O address register 1B	IOAR1B	R/W	Undetermined
	H'FF3C	Execute transfer count register 1BH	ETCR1BH	R/W	Undetermined
	H'FF3D	Execute transfer count register 1BL	ETCR1BL	R/W	Undetermined
	H'FF3F	Data transfer control register 1B	DTCR1B	R/W	H'00

Note: * The lower 16 bits of the address are indicated.

8.2 Register Descriptions (Short Address Mode)

In short address mode, transfers can be carried out independently on channels A and B. Short address mode is selected by bits DTS2A and DTS1A in data transfer control register A (DTCRA) as indicated in table 8.4.

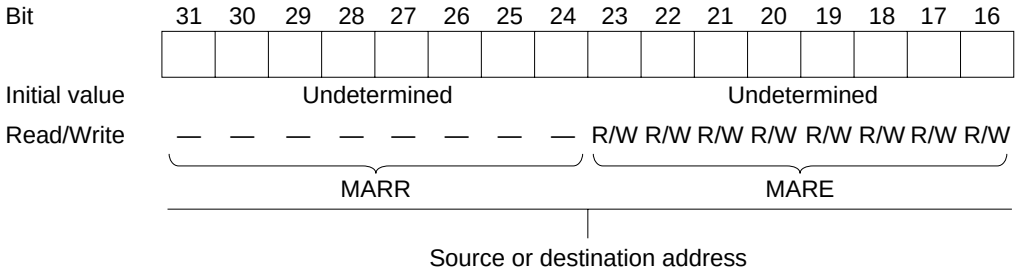
Table 8.4 Selection of Short and Full Address Modes

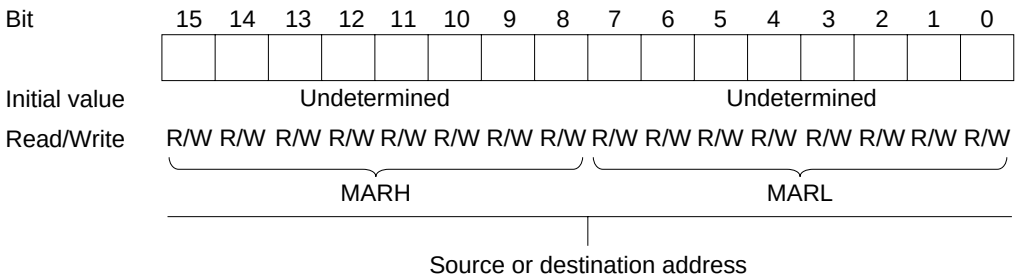
Channel	Bit 2: DTS2A	Bit 1: DTS1A	Description
0	1	1	DMAC channel 0 operates as one channel in full address mode
	Other than above		DMAC channels 0A and 0B operate as two independent channels in short address mode
1	1	1	DMAC channel 1 operates as one channel in full address mode
	Other than above		DMAC channels 1A and 1B operate as two independent channels in short address mode

8.2.1 Memory Address Registers (MAR)

A memory address register (MAR) is a 32-bit readable/writable register that specifies a source or destination address. The transfer direction is determined automatically from the activation source.

An MAR consists of four 8-bit registers designated MARR, MARE, MARH, and MARL. All bits of MARR are reserved: they cannot be modified and always return an undetermined value when read.





An MAR functions as a source or destination address register depending on how the DMAC is activated: as a destination address register if activation is by a receive-data-full interrupt from the serial communication interface (SCI) (channel 0), and as a source address register otherwise.

The MAR value is incremented or decremented each time one byte or word is transferred, automatically updating the source or destination memory address. For details, see section 8.2.4, Data Transfer Control Registers (DTCR).

The MARs are not initialized by a reset or in standby mode.

8.2.2 I/O Address Registers (IOAR)

An I/O address register (IOAR) is an 8-bit readable/writable register that specifies a source or destination address. The IOAR value is the lower 8 bits of the address. The upper 16 address bits are all 1 (H'FFFF).

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Source or destination address

An IOAR functions as a source or destination address register depending on how the DMAC is activated: as a source address register if activation is by a receive-data-full interrupt from the SCI (channel 0), and as a destination address register otherwise.

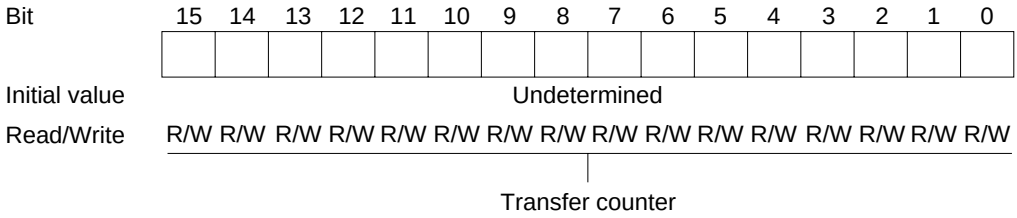
The IOAR value is held fixed. It is not incremented or decremented when a transfer is executed.

The IOARs are not initialized by a reset or in standby mode.

8.2.3 Execute Transfer Count Registers (ETCR)

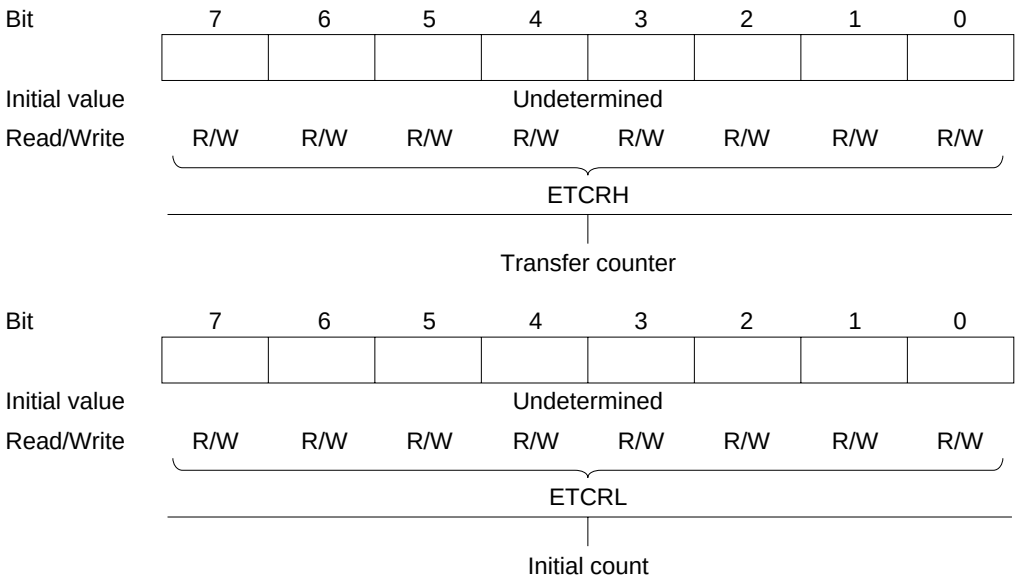
An execute transfer count register (ETCR) is a 16-bit readable/writable register that specifies the number of transfers to be executed. These registers function in one way in I/O mode and idle mode, and another way in repeat mode.

- I/O mode and idle mode



In I/O mode and idle mode, ETCR functions as a 16-bit counter. The count is decremented by 1 each time one transfer is executed. The transfer ends when the count reaches H'0000.

- Repeat mode

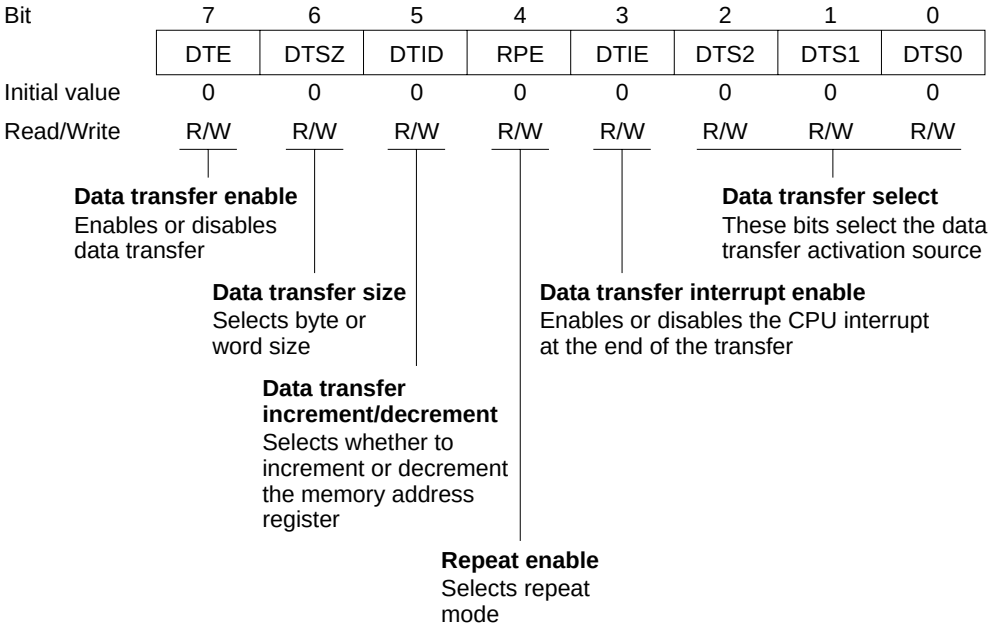


In repeat mode, ETCRH functions as an 8-bit transfer counter and ETCRL holds the initial transfer count. ETCRH is decremented by 1 each time one transfer is executed. When ETCRH reaches H'00, the value in ETCRL is reloaded into ETCRH and the same operation is repeated.

The ETCRs are not initialized by a reset or in standby mode.

8.2.4 Data Transfer Control Registers (DTCR)

A data transfer control register (DTCR) is an 8-bit readable/writable register that controls the operation of one DMAC channel.



The DTCRs are initialized to H'00 by a reset and in standby mode.

Bit 7—Data Transfer Enable (DTE): Enables or disables data transfer on a channel. When the DTE bit is set to 1, the channel waits for a transfer to be requested, and executes the transfer when activated as specified by bits DTS2 to DTS0. When DTE is 0, the channel is disabled and does not accept transfer requests. DTE is set to 1 by reading the register when DTE is 0, then writing 1.

Bit 7: DTE	Description
0	Data transfer is disabled. In I/O mode or idle mode, DTE is cleared to 0 when the specified number of transfers have been completed. (Initial value)
1	Data transfer is enabled

If DTIE is set to 1, a CPU interrupt is requested when DTE is cleared to 0.

Bit 6—Data Transfer Size (DTSZ): Selects the data size of each transfer.

Bit 6: DTSZ	Description	
0	Byte-size transfer	(Initial value)
1	Word-size transfer	

Bit 5—Data Transfer Increment/Decrement (DTID): Selects whether to increment or decrement the memory address register (MAR) after a data transfer in I/O mode or repeat mode.

Bit 5: DTID	Description
0	MAR is incremented after each data transfer • If DTSZ = 0, MAR is incremented by 1 after each transfer • If DTSZ = 1, MAR is incremented by 2 after each transfer
1	MAR is decremented after each data transfer • If DTSZ = 0, MAR is decremented by 1 after each transfer • If DTSZ = 1, MAR is decremented by 2 after each transfer

MAR is not incremented or decremented in idle mode.

Bit 4—Repeat Enable (RPE): Selects whether to transfer data in I/O mode, idle mode, or repeat mode.

Bit 4: RPE	Bit 3: DTIE	Description	
0	0	I/O mode	(Initial value)
	1		
1	0	Repeat mode	
	1	Idle mode	

Operations in these modes are described in sections 8.4.2, I/O Mode, 8.4.3, Idle Mode, and 8.4.4, Repeat Mode.

Bit 3—Data Transfer Interrupt Enable (DTIE): Enables or disables the CPU interrupt (DEND) requested when the DTE bit is cleared to 0.

Bit 3: DTIE	Description	
0	The DEND interrupt requested by DTE is disabled	(Initial value)
1	The DEND interrupt requested by DTE is enabled	

Bits 2 to 0—Data Transfer Select (DTS2, DTS1, DTS0): These bits select the data transfer activation source. Some of the selectable sources differ between channels A and B.

Note: Refer to 8.3.4, Data Transfer Control Registers (DTCR).

Bit 2: DTS2	Bit 1: DTS1	Bit 0: DTS0	Description
0	0	0	Compare match/input capture A interrupt from ITU channel 0 (Initial value)
		1	Compare match/input capture A interrupt from ITU channel 1
	1	0	Compare match/input capture A interrupt from ITU channel 2
		1	Compare match/input capture A interrupt from ITU channel 3
1	0	0	Transmit-data-empty interrupt from SCI channel 0
		1	Receive-data-full interrupt from SCI channel 0
	1	0	Falling edge of DREQ input (channel B) Transfer in full address mode (channel A)
		1	Low level of DREQ input (channel B) Transfer in full address mode (channel A)

The same internal interrupt can be selected as an activation source for two or more channels at once. In that case the channels are activated in a priority order, highest-priority channel first. For the priority order, see section 8.4.9, DMAC Multiple-Channel Operation.

When a channel is enabled (DTE = 1), its selected DMAC activation source cannot generate a CPU interrupt.

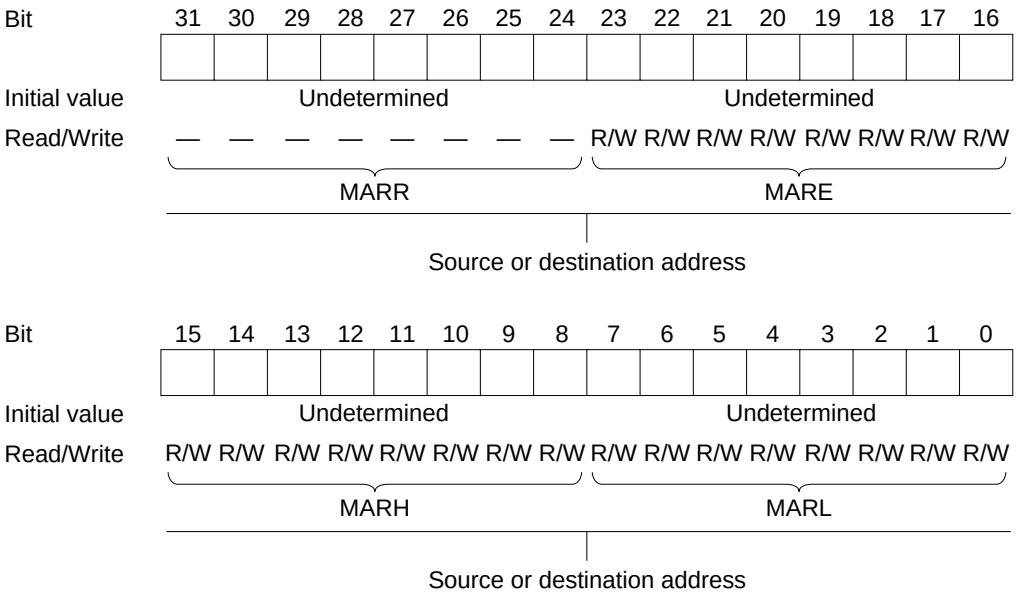
8.3 Register Descriptions (Full Address Mode)

In full address mode the A and B channels operate together. Full address mode is selected as indicated in table 8.4.

8.3.1 Memory Address Registers (MAR)

A memory address register (MAR) is a 32-bit readable/writable register. MARA functions as the source address register of the transfer, and MARB as the destination address register.

An MAR consists of four 8-bit registers designated MARR, MARE, MARH, and MARL. All bits of MARR are reserved: they cannot be modified and always return an undetermined value when read.



The MAR value is incremented or decremented each time one byte or word is transferred, automatically updating the source or destination memory address. For details, see section 8.3.4, Data Transfer Control Registers (DTCR).

The MARs are not initialized by a reset or in standby mode.

8.3.2 I/O Address Registers (IOAR)

The I/O address registers (IOARs) are not used in full address mode.

8.3.3 Execute Transfer Count Registers (ETCR)

An execute transfer count register (ETCR) is a 16-bit readable/writable register that specifies the number of transfers to be executed. The functions of these registers differ between normal mode and block transfer mode.

- Normal mode

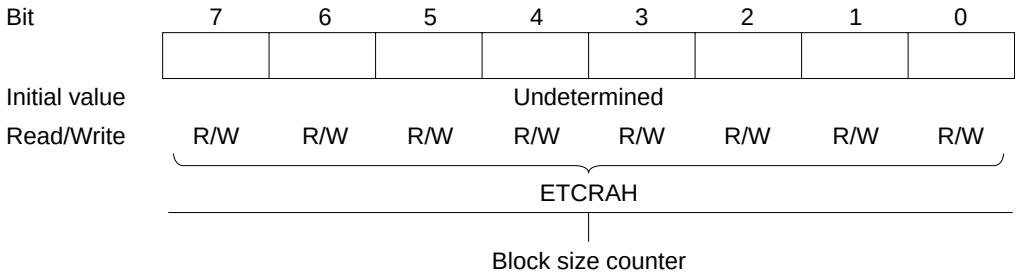
  ETCRA

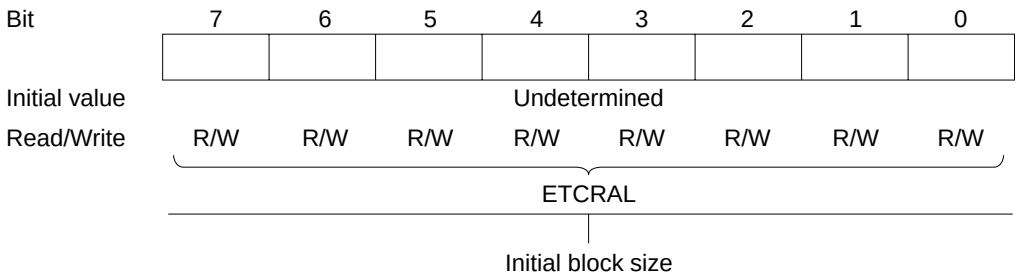
  ETCRB: Is not used in normal mode.

  In normal mode ETCRA functions as a 16-bit transfer counter. The count is decremented by 1 each time one transfer is executed. The transfer ends when the count reaches H'0000. ETCRB is not used.

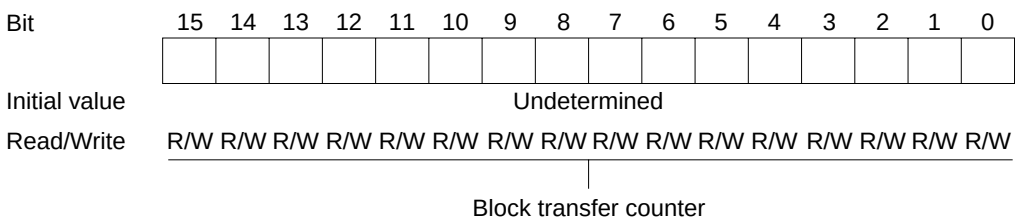
- Block transfer mode

ETCRA





ETCRB



In block transfer mode, ETCRAH functions as an 8-bit block size counter. ETCRAL holds the initial block size. ETCRAH is decremented by 1 each time one byte or word is transferred. When the count reaches H'00, ETCRAH is reloaded from ETCRAL. Blocks consisting of an arbitrary number of bytes or words can be transferred repeatedly by setting the same initial block size value in ETCRAH and ETCRAL.

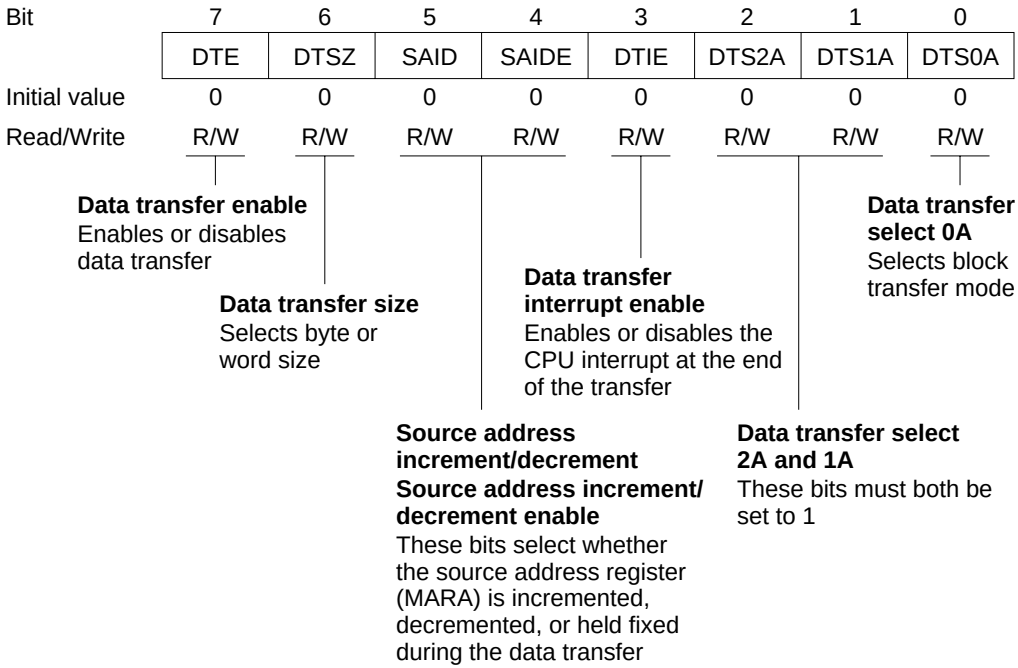
In block transfer mode ETCRB functions as a 16-bit block transfer counter. ETCRB is decremented by 1 each time one block is transferred. The transfer ends when the count reaches H'0000.

The ETCRs are not initialized by a reset or in standby mode.

8.3.4 Data Transfer Control Registers (DTCR)

The data transfer control registers (DTCRs) are 8-bit readable/writable registers that control the operation of the DMAC channels. A channel operates in full address mode when bits DTS2A and DTS1A are both set to 1 in DTCRA. DTCRA and DTCRB have different functions in full address mode.

DTCRA



DTCRA is initialized to H'00 by a reset and in standby mode.

Bit 7—Data Transfer Enable (DTE): Together with the DTME bit in DTCRB, this bit enables or disables data transfer on the channel. When the DTME and DTE bits are both set to 1, the channel is enabled. If auto-request is specified, data transfer begins immediately. Otherwise, the channel waits for transfers to be requested. When the specified number of transfers have been completed, the DTE bit is automatically cleared to 0. When DTE is 0, the channel is disabled and does not accept transfer requests. DTE is set to 1 by reading the register when DTE is 0, then writing 1.

Bit 7: DTE	Description
0	Data transfer is disabled (DTE is cleared to 0 when the specified number of transfers have been completed) (Initial value)
1	Data transfer is enabled

If DTIE is set to 1, a CPU interrupt is requested when DTE is cleared to 0.

Bit 6—Data Transfer Size (DTSZ): Selects the data size of each transfer.

Bit 6: DTSZ	Description
0	Byte-size transfer (Initial value)
1	Word-size transfer

Bit 5—Source Address Increment/Decrement (SAID) and Bit 4—Source Address Increment/Decrement Enable (SAIDE): These bits select whether the source address register (MARA) is incremented, decremented, or held fixed during the data transfer.

Bit 5: SAID	Bit 4: SAIDE	Description
0	0	MARA is held fixed (Initial value)
	1	MARA is incremented after each data transfer • If DTSZ = 0, MARA is incremented by 1 after each transfer • If DTSZ = 1, MARA is incremented by 2 after each transfer
1	0	MARA is held fixed
	1	MARA is decremented after each data transfer • If DTSZ = 0, MARA is decremented by 1 after each transfer • If DTSZ = 1, MARA is decremented by 2 after each transfer

Bit 3—Data Transfer Interrupt Enable (DTIE): Enables or disables the CPU interrupt (DEND) requested when the DTE bit is cleared to 0.

Bit 3: DTIE	Description	
0	The DEND interrupt requested by DTE is disabled	(Initial value)
1	The DEND interrupt requested by DTE is enabled	

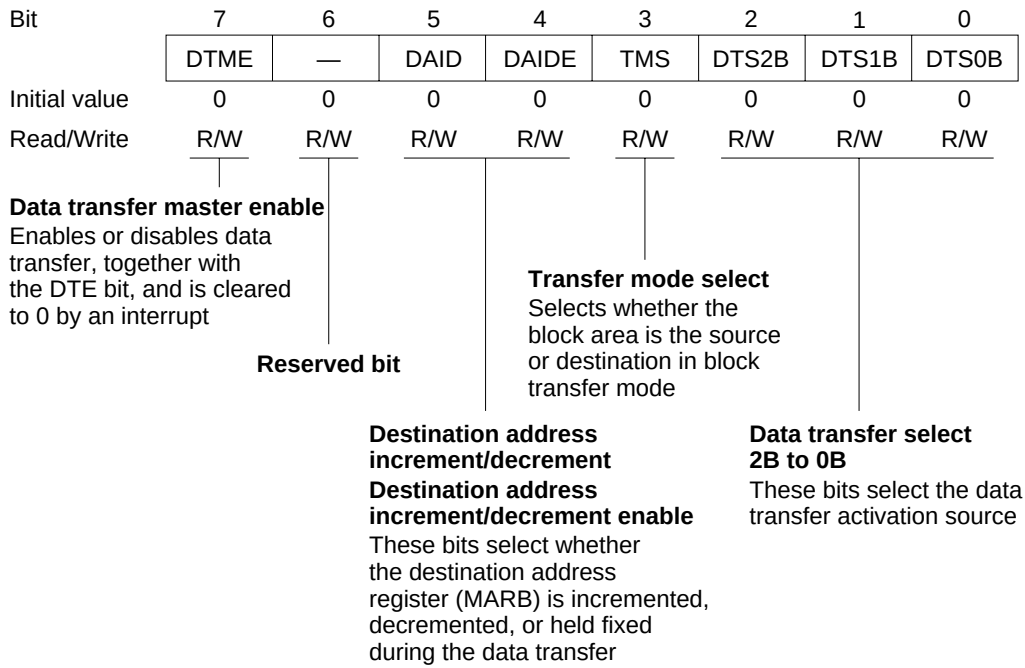
Bits 2 and 1—Data Transfer Select 2A and 1A (DTS2A, DTS1A): A channel operates in full address mode when DTS2A and DTS1A are both set to 1.

Bit 0—Data Transfer Select 0A (DTS0A): Selects normal mode or block transfer mode.

Bit 0: DTS0A	Description	
0	Normal mode	(Initial value)
1	Block transfer mode	

Operations in these modes are described in sections 8.4.5, Normal Mode, and 8.4.6, Block Transfer Mode.

DTCRB



DTCRB is initialized to H'00 by a reset and in standby mode.

Bit 7—Data Transfer Master Enable (DTME): Together with the DTE bit in DTCRA, this bit enables or disables data transfer. When the DTME and DTE bits are both set to 1, the channel is enabled. When an NMI interrupt occurs DTME is cleared to 0, suspending the transfer so that the CPU can use the bus. The suspended transfer resumes when DTME is set to 1 again. For further information on operation in block transfer mode, see section 8.6.6, NMI Interrupts and Block Transfer Mode.

DTME is set to 1 by reading the register while DTME = 0, then writing 1.

Bit 7: DTME	Description
0	Data transfer is disabled (DTME is cleared to 0 when an NMI interrupt occurs) (Initial value)
1	Data transfer is enabled

Bit 6—Reserved: Although reserved, this bit can be written and read.

Bit 5—Destination Address Increment/Decrement (DAID) and Bit 4—Destination Address Increment/Decrement Enable (DAIDE): These bits select whether the destination address register (MARB) is incremented, decremented, or held fixed during the data transfer.

Bit 5: DAID	Bit 4: DAIDE	Description
0	0	MARB is held fixed (Initial value)
	1	MARB is incremented after each data transfer • If DTSZ = 0, MARB is incremented by 1 after each data transfer • If DTSZ = 1, MARB is incremented by 2 after each data transfer
1	0	MARB is held fixed
	1	MARB is decremented after each data transfer • If DTSZ = 0, MARB is decremented by 1 after each data transfer • If DTSZ = 1, MARB is decremented by 2 after each data transfer

Bit 3—Transfer Mode Select (TMS): Selects whether the source or destination is the block area in block transfer mode.

Bit 3: TMS	Description
0	Destination is the block area in block transfer mode (Initial value)
1	Source is the block area in block transfer mode

Bits 2 to 0—Data Transfer Select 2B to 0B (DTS2B, DTS1B, DTS0B): These bits select the data transfer activation source. The selectable activation sources differ between normal mode and block transfer mode.

- Normal mode

Bit 2: DTS2B	Bit 1: DTS1B	Bit 0: DTS0B	Description
0	0	0	Auto-request (burst mode) (Initial value)
		1	Cannot be used
	1	0	Auto-request (cycle-steal mode)
		1	Cannot be used
1	0	0	Cannot be used
		1	Cannot be used
	1	0	Falling edge of $\overline{\text{DREQ}}$
		1	Low level input at $\overline{\text{DREQ}}$

- Block transfer mode

Bit 2: DTS2B	Bit 1: DTS1B	Bit 0: DTS0B	Description
0	0	0	Compare match/input capture A interrupt from ITU channel 0 (Initial value)
		1	Compare match/input capture A interrupt from ITU channel 1
	1	0	Compare match/input capture A interrupt from ITU channel 2
		1	Compare match/input capture A interrupt from ITU channel 3
1	0	0	Cannot be used
		1	Cannot be used
	1	0	Falling edge of $\overline{\text{DREQ}}$
		1	Cannot be used

The same internal interrupt can be selected to activate two or more channels. The channels are activated in a priority order, highest priority first. For the priority order, see section 8.4.9, DMAC Multiple-Channel Operation.

8.4 Operation

8.4.1 Overview

Table 8.5 summarizes the DMAC modes.

Table 8.5 DMAC Modes

Transfer Mode		Activation	Notes
Short address mode	I/O mode Idle mode Repeat mode	Compare match/input capture A interrupt from ITU channels 0 to 3	• Up to four channels can operate independently • Only the B channels support external requests
		Transmit-data-empty and receive-data-full interrupts from SCI channel 0	
		External request	
Full address mode	Normal mode	Auto-request	• A and B channels are paired; up to two channels are available • Burst mode or cycle-steal mode can be selected for auto-requests
		External request	
	Block transfer mode	Compare match/input capture A interrupt from ITU channels 0 to 3	
		External request	

A summary of operations in these modes follows.

I/O Mode: One byte or word is transferred per request. A designated number of these transfers are executed. A CPU interrupt can be requested at completion of the designated number of transfers. One 24-bit address and one 8-bit address are specified. The transfer direction is determined automatically from the activation source.

Idle Mode: One byte or word is transferred per request. A designated number of these transfers are executed. A CPU interrupt can be requested at completion of the designated number of transfers. One 24-bit address and one 8-bit address are specified. The addresses are held fixed. The transfer direction is determined automatically from the activation source.

Repeat Mode: One byte or word is transferred per request. A designated number of these transfers are executed. When the designated number of transfers are completed, the initial address and counter value are restored and operation continues. No CPU interrupt is requested. One 24-bit address and one 8-bit address are specified. The transfer direction is determined automatically from the activation source.

Normal Mode

- Auto-request

  The DMAC is activated by register setup alone, and continues executing transfers until the designated number of transfers have been completed. A CPU interrupt can be requested at completion of the transfers. Both addresses are 24-bit addresses.

  — Cycle-steal mode

    The bus is released to another bus master after each byte or word is transferred.

  — Burst mode

    Unless requested by a higher-priority bus master, the bus is not released until the designated number of transfers have been completed.

- External request

  One byte or word is transferred per request. A designated number of these transfers are executed. A CPU interrupt can be requested at completion of the designated number of transfers. Both addresses are 24-bit addresses.

Block Transfer Mode: One block of a specified size is transferred per request. A designated number of block transfers are executed. At the end of each block transfer, one address is restored to its initial value. When the designated number of blocks have been transferred, a CPU interrupt can be requested. Both addresses are 24-bit addresses.

8.4.2 I/O Mode

I/O mode can be selected independently for each channel.

One byte or word is transferred at each transfer request in I/O mode. A designated number of these transfers are executed. One address is specified in the memory address register (MAR), the other in the I/O address register (IOAR). The direction of transfer is determined automatically from the activation source. The transfer is from the address specified in IOAR to the address specified in MAR if activated by an SCI channel 0 receive-data-full interrupt, and from the address specified in MAR to the address specified in IOAR otherwise.

Table 8.6 indicates the register functions in I/O mode.

Table 8.6 Register Functions in I/O Mode

	Function			
Register	**Activated by SCI 0 Receive-Data-Full Interrupt**	**Other Activation**	**Initial Setting**	**Operation**
	Destination address register	Source address register	Destination or source address	Incremented or decremented once per transfer
	Source address register	Destination address register	Source or destination address	Held fixed
	Transfer counter	Transfer counter	Number of transfers	Decremented once per transfer until H'0000 is reached and transfer ends

Legend:
MAR: Memory address register
IOAR: I/O address register
ETCR: Execute transfer count register

MAR and IOAR specify the source and destination addresses. MAR specifies a 24-bit source or destination address, which is incremented or decremented as each byte or word is transferred. IOAR specifies the lower 8 bits of a fixed address. The upper 16 bits are all 1s. IOAR is not incremented or decremented.

Figure 8.2 illustrates how I/O mode operates.

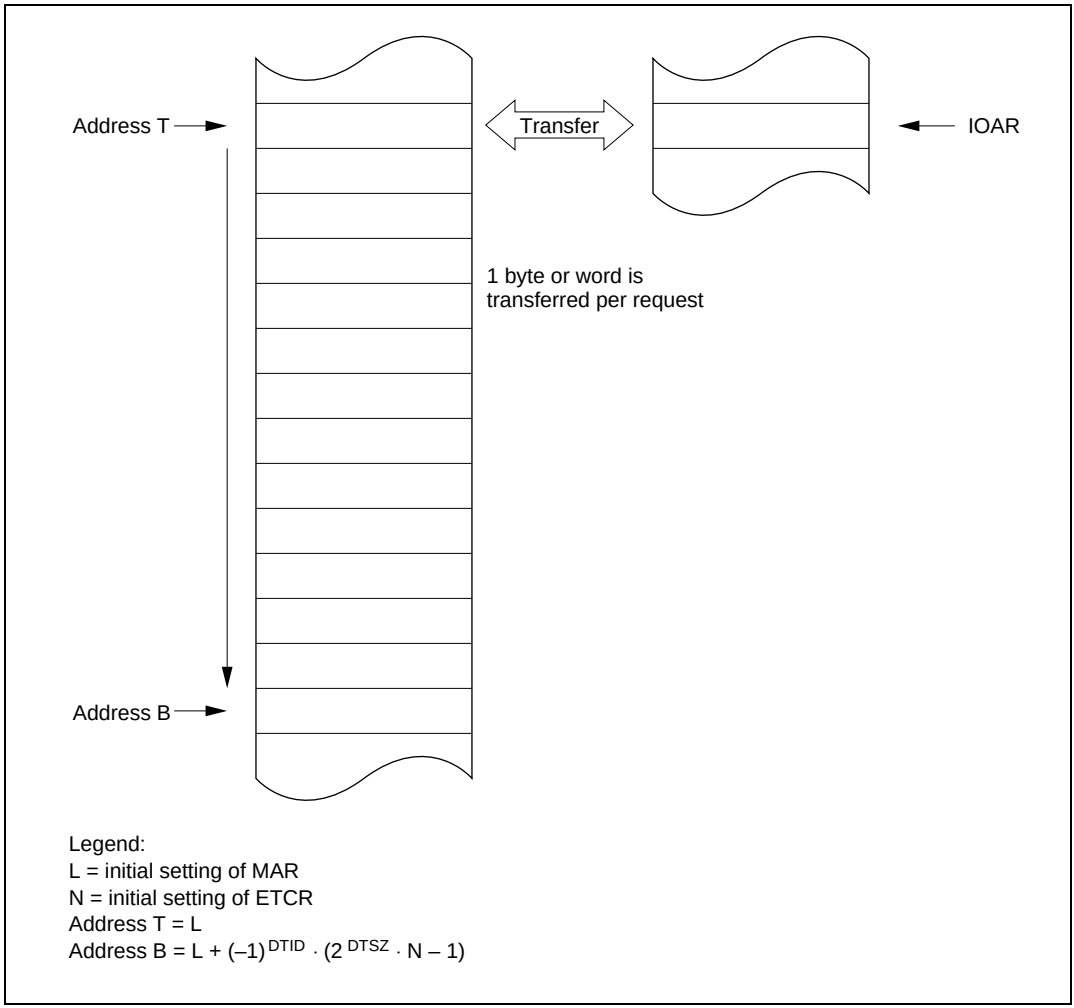


Figure 8.2 Operation in I/O Mode

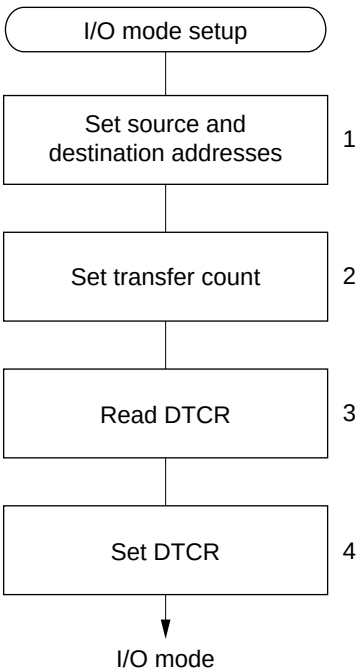
The transfer count is specified as a 16-bit value in ETCR. The ETCR value is decremented by 1 at each transfer. When the ETCR value reaches H'0000, the DTE bit is cleared and the transfer ends. If the DTIE bit is set to 1, a CPU interrupt is requested at this time. The maximum transfer count is 65,536, obtained by setting ETCR to H'0000.

Transfers can be requested (activated) by compare match/input capture A interrupts from ITU channels 0 to 3, transmit-data-empty and receive-data-full interrupts from SCI channel 0, and external request signals.

For the detailed settings see section 8.2.4, Data Transfer Control Registers (DTCR).

Figure 8.3 shows a sample setup procedure for I/O mode.



1. Set the source and destination addresses in MAR and IOAR. The transfer direction is determined automatically from the activation source.
2. Set the transfer count in ETCR.
3. Read DTCR while the DTE bit is cleared to 0.
4. Set the DTCR bits as follows.
   - Select the DMAC activation source with bits DTS2 to DTS0.
   - Set or clear the DTIE bit to enable or disable the CPU interrupt at the end of the transfer.
   - Clear the RPE bit to 0 to select I/O mode.
   - Select MAR increment or decrement with the DTID bit.
   - Select byte size or word size with the DTSZ bit.
   - Set the DTE bit to 1 to enable the transfer.

Figure 8.3 I/O Mode Setup Procedure (Example)

8.4.3 Idle Mode

Idle mode can be selected independently for each channel.

One byte or word is transferred at each transfer request in idle mode. A designated number of these transfers are executed. One address is specified in the memory address register (MAR), the other in the I/O address register (IOAR). The direction of transfer is determined automatically from the activation source. The transfer is from the address specified in IOAR to the address specified in MAR if activated by an SCI channel 0 receive-data-full interrupt, and from the address specified in MAR to the address specified in IOAR otherwise.

Table 8.7 indicates the register functions in idle mode.

Table 8.7 Register Functions in Idle Mode

Register	Function: Activated by SCI 0 Receive-Data-Full Interrupt	Function: Other Activation	Initial Setting	Operation
23 MAR 0	Destination address register	Source address register	Destination or source address	Held fixed
23 All 1s 7 IOAR 0	Source address register	Destination address register	Source or destination address	Held fixed
15 ETCR 0	Transfer counter	Transfer counter	Number of transfers	Decremented once per transfer until H'0000 is reached and transfer ends

Legend:
MAR: Memory address register
IOAR: I/O address register
ETCR: Execute transfer count register

MAR and IOAR specify the source and destination addresses. MAR specifies a 24-bit source or destination address. IOAR specifies the lower 8 bits of a fixed address. The upper 16 bits are all 1s. MAR and IOAR are not incremented or decremented.

Figure 8.4 illustrates how idle mode operates.

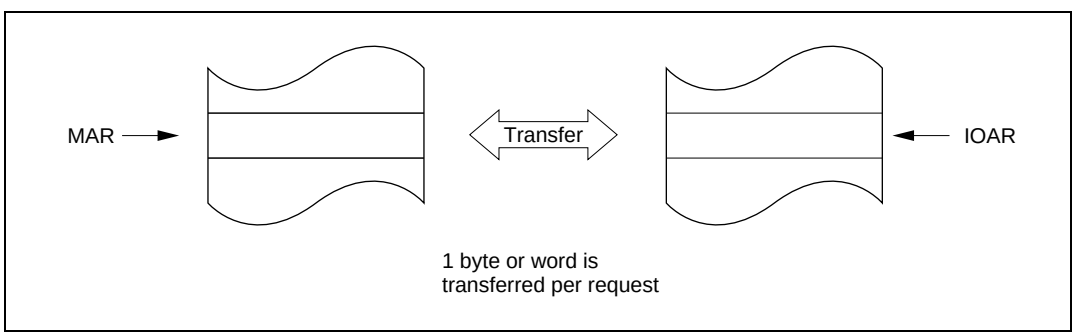


Figure 8.4 Operation in Idle Mode

The transfer count is specified as a 16-bit value in ETCR. The ETCR value is decremented by 1 at each transfer. When the ETCR value reaches H'0000, the DTE bit is cleared, the transfer ends, and a CPU interrupt is requested. The maximum transfer count is 65,536, obtained by setting ETCR to H'0000.

Transfers can be requested (activated) by compare match/input capture A interrupts from ITU channels 0 to 3, transmit-data-empty and receive-data-full interrupts from SCI channel 0, and external request signals.

For the detailed settings see section 8.2.4, Data Transfer Control Registers (DTCR).

Figure 8.5 shows a sample setup procedure for idle mode.

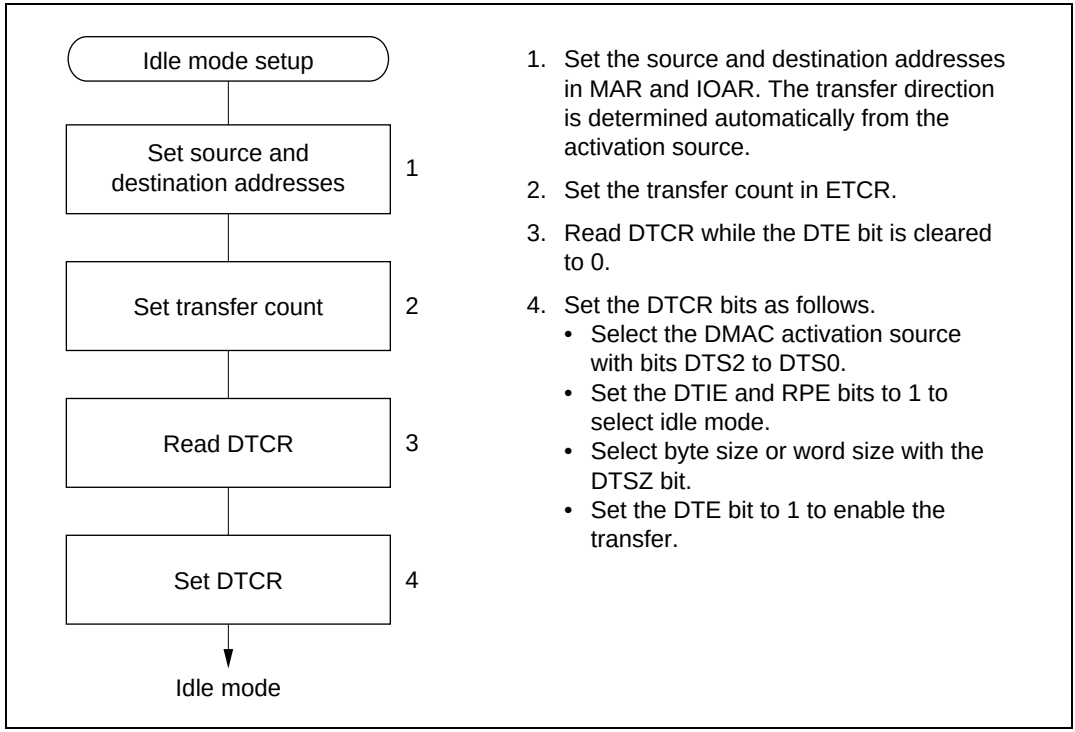

Figure 8.5 Idle Mode Setup Procedure (Example)

8.4.4 Repeat Mode

Repeat mode is useful for cyclically transferring a bit pattern from a table to the programmable timing pattern controller (TPC) in synchronization, for example, with ITU compare match. Repeat mode can be selected for each channel independently.

One byte or word is transferred per request in repeat mode, as in I/O mode. A designated number of these transfers are executed. One address is specified in the memory address register (MAR), the other in the I/O address register (IOAR). At the end of the designated number of transfers, MAR and ETCR are restored to their original values and operation continues. The direction of transfer is determined automatically from the activation source. The transfer is from the address specified in IOAR to the address specified in MAR if activated by an SCI channel 0 receive-data-full interrupt, and from the address specified in MAR to the address specified in IOAR otherwise.

Table 8.8 indicates the register functions in repeat mode.

Table 8.8 Register Functions in Repeat Mode

Register	Function: Activated by SCI 0 Receive-Data-Full Interrupt	Function: Other Activation	Initial Setting	Operation
	Destination address register	Source address register	Destination or source address	Incremented or decremented at each transfer until H'0000, then restored to initial value
	Source address register	Destination address register	Source or destination address	Held fixed
	Transfer counter	Transfer counter	Number of transfers	Decremented once per transfer until H'0000 is reached, then reloaded from ETCRL
	Hold transfer count	Hold transfer count	Number of transfers	Held fixed

Legend:
MAR: Memory address register
IOAR: I/O address register
ETCR: Execute transfer count register

In repeat mode ETCRH is used as the transfer counter while ETCRL holds the initial transfer count. ETCRH is decremented by 1 at each transfer until it reaches H'00, then is reloaded from ETCRL. MAR is also restored to its initial value, which is calculated from the DTSZ and DTID bits in DTCR. Specifically, MAR is restored as follows:

$$MAR \leftarrow MAR - (-1)^{DTID} \cdot 2^{DTSZ} \cdot ETCRL$$

ETCRH and ETCRL should be initially set to the same value.

In repeat mode transfers continue until the CPU clears the DTE bit to 0. After DTE is cleared to 0, if the CPU sets DTE to 1 again, transfers resume from the state at which DTE was cleared. No CPU interrupt is requested.

As in I/O mode, MAR and IOAR specify the source and destination addresses. MAR specifies a 24-bit source or destination address. IOAR specifies the lower 8 bits of a fixed address. The upper 16 bits are all 1s. IOAR is not incremented or decremented.

Figure 8.6 illustrates how repeat mode operates.

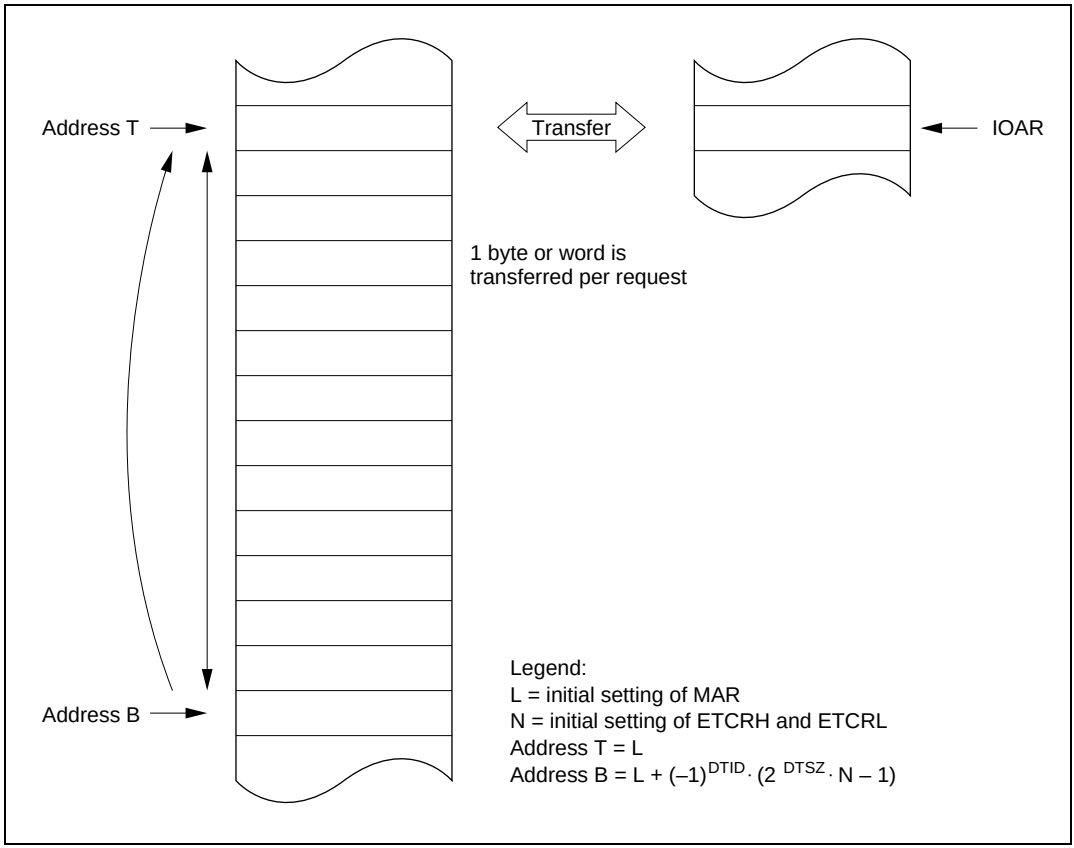

Figure 8.6 Operation in Repeat Mode

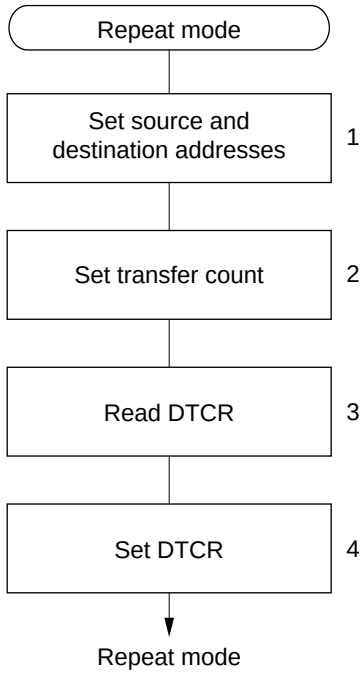
The transfer count is specified as an 8-bit value in ETCRH and ETCRL. The maximum transfer count is 255, obtained by setting both ETCRH and ETCRL to H'FF.

Transfers can be requested (activated) by compare match/input capture A interrupts from ITU channels 0 to 3, transmit-data-empty and receive-data-full interrupts from SCI channel 0, and external request signals.

For the detailed settings see section 8.2.4, Data Transfer Control Registers (DTCR).

Figure 8.7 shows a sample setup procedure for repeat mode.



1. Set the source and destination addresses in MAR and IOAR. The transfer direction is determined automatically from the activation source.
2. Set the transfer count in both ETCRH and ETCRL.
3. Read DTCR while the DTE bit is cleared to 0.
4. Set the DTCR bits as follows.
   - Select the DMAC activation source with bits DTS2 to DTS0.
   - Clear the DTIE bit to 0 and set the RPE bit to 1 to select repeat mode.
   - Select MAR increment or decrement with the DTID bit.
   - Select byte size or word size with the DTSZ bit.
   - Set the DTE bit to 1 to enable the transfer.

Figure 8.7 Repeat Mode Setup Procedure (Example)

8.4.5 Normal Mode

In normal mode the A and B channels are combined. One byte or word is transferred per request. A designated number of these transfers are executed. Addresses are specified in MARA and MARB. Table 8.9 indicates the register functions in I/O mode.

Table 8.9 Register Functions in Normal Mode

Register	Function	Initial Setting	Operation
23 0 MARA	Source address register	Source address	Incremented or decremented once per transfer, or held fixed
23 0 MARB	Destination address register	Destination address	Incremented or decremented once per transfer, or held fixed
15 0 ETCRA	Transfer counter	Number of transfers	Decremented once per transfer

Legend:
MARA: Memory address register A
MARB: Memory address register B
ETCRA: Execute transfer count register A

The source and destination addresses are both 24-bit addresses. MARA specifies the source address. MARB specifies the destination address. MARA and MARB can be independently incremented, decremented, or held fixed as data is transferred.

The transfer count is specified as a 16-bit value in ETCRA. The ETCRA value is decremented by 1 at each transfer. When the ETCRA value reaches H'0000, the DTE bit is cleared and the transfer ends. If the DTIE bit is set, a CPU interrupt is requested at this time. The maximum transfer count is 65,536, obtained by setting ETCRA to H'0000.

Figure 8.8 illustrates how normal mode operates.

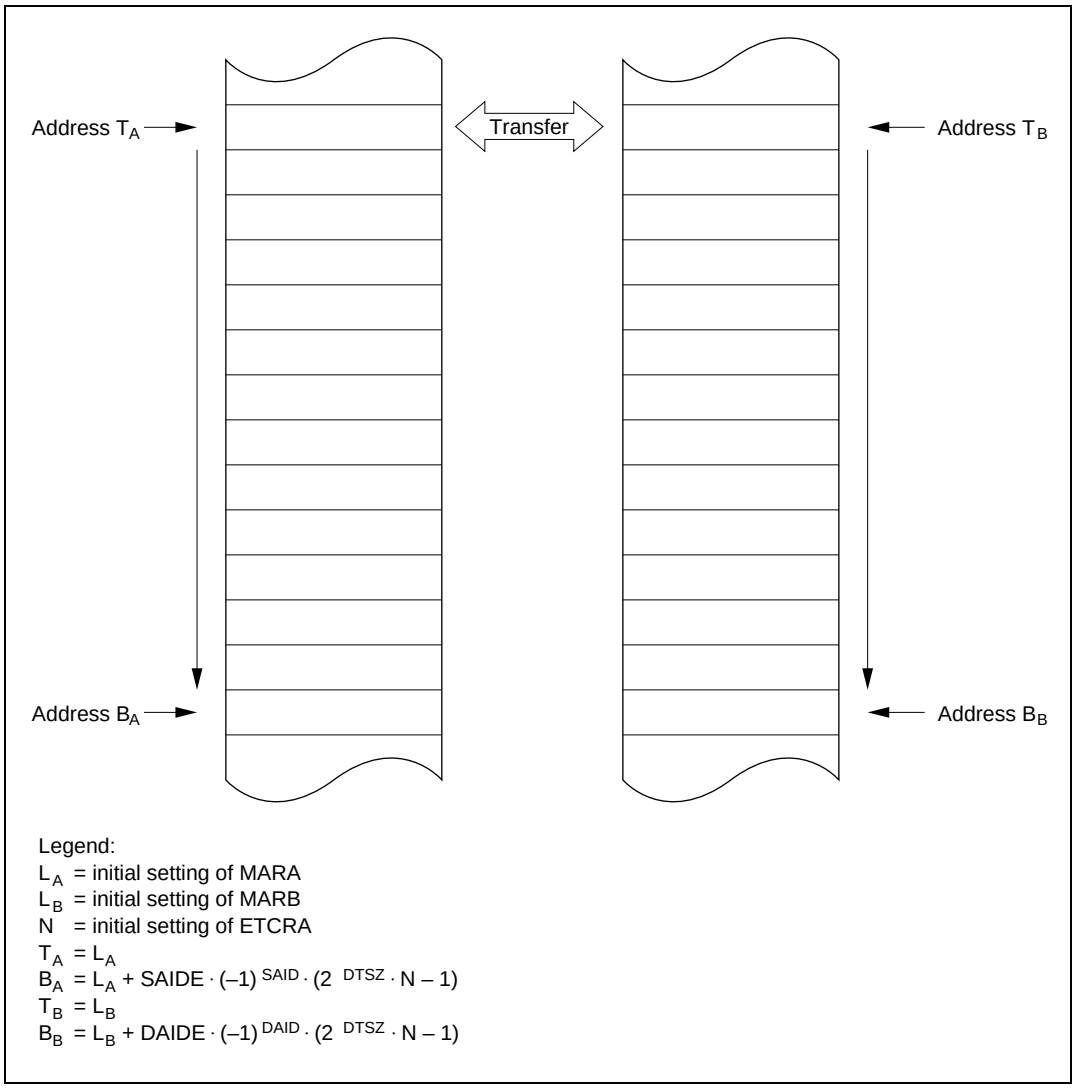


Figure 8.8 Operation in Normal Mode

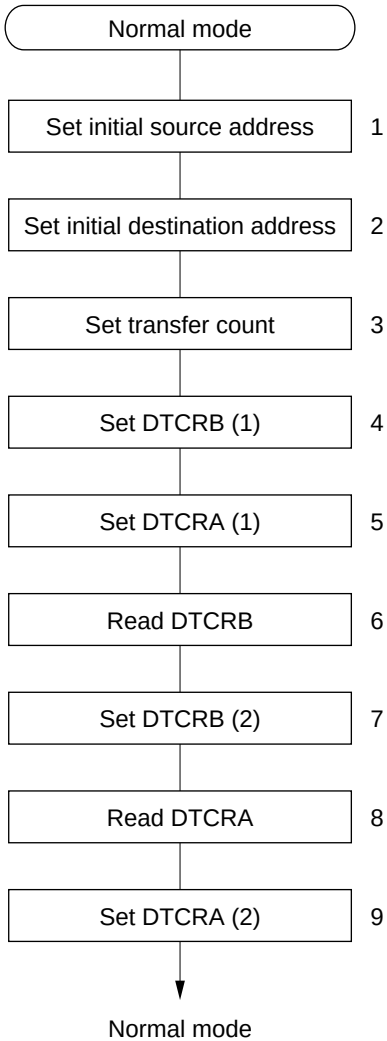
Transfers can be requested (activated) by an external request or auto-request. An auto-requested transfer is activated by the register settings alone. The designated number of transfers are executed automatically. Either cycle-steal or burst mode can be selected. In cycle-steal mode the DMAC releases the bus temporarily after each transfer. In burst mode the DMAC keeps the bus until the transfers are completed, unless there is a bus request from a higher-priority bus master.

For the detailed settings see section 8.3.4, Data Transfer Control Registers (DTCR).

Figure 8.9 shows a sample setup procedure for normal mode.



1. Set the initial source address in MARA.
2. Set the initial destination address in MARB.
3. Set the transfer count in ETCRA.
4. Set the DTCRB bits as follows.
   - Clear the DTME bit to 0.
   - Set the DAID and DAIDE bits to select whether MARB is incremented, decremented, or held fixed.
   - Select the DMAC activation source with bits DTS2B to DTS0B.
5. Set the DTCRA bits as follows.
   - Clear the DTE bit to 0.
   - Select byte or word size with the DTSZ bit.
   - Set the SAID and SAIDE bits to select whether MARA is incremented, decremented, or held fixed.
   - Set or clear the DTIE bit to enable or disable the CPU interrupt at the end of the transfer.
   - Clear the DTS0A bit to 0 and set the DTS2A and DTS1A bits to 1 to select normal mode.
6. Read DTCRB with DTME cleared to 0.
7. Set the DTME bit to 1 in DTCRB.
8. Read DTCRA with DTE cleared to 0.
9. Set the DTE bit to 1 in DTCRA to enable the transfer.

Note: Carry out settings 1 to 9 with the DEND interrupt masked in the CPU.
If an NMI interrupt occurs during the setup procedure, it may clear the DTME bit to 0, in which case the transfer will not start.

Figure 8.9 Normal Mode Setup Procedure (Example)

8.4.6 Block Transfer Mode

In block transfer mode the A and B channels are combined. One block of a specified size is transferred per request. A designated number of block transfers are executed. Addresses are specified in MARA and MARB. The block area address can be either held fixed or cycled.

Table 8.10 indicates the register functions in block transfer mode.

Table 8.10 Register Functions in Block Transfer Mode

Register	Function	Initial Setting	Operation
	Source address register	Source address	Incremented or decremented once per transfer, or held fixed
	Destination address register	Destination address	Incremented or decremented once per transfer, or held fixed
	Block size counter	Block size	Decremented once per transfer until H'00 is reached, then reloaded from ETCRAL
	Initial block size	Block size	Held fixed
	Block transfer counter	Number of block transfers	Decremented once per block transfer until H'0000 is reached and the transfer ends

Legend:
MARA: Memory address register A
MARB: Memory address register B
ETCRA: Execute transfer count register A
ETCRB: Execute transfer count register B

The source and destination addresses are both 24-bit addresses. MARA specifies the source address. MARB specifies the destination address. MARA and MARB can be independently incremented, decremented, or held fixed as data is transferred. One of these registers operates as a block area register: even if it is incremented or decremented, it is restored to its initial value at the end of each block transfer. The TMS bit in DTCRB selects whether the block area is the source or destination.

If M (1 to 255) is the size of the block transferred at each request and N (1 to 65,536) is the number of blocks to be transferred, then ETCRAH and ETCRAL should initially be set to M and ETCRB should initially be set to N.

Figure 8.10 illustrates how block transfer mode operates. In this figure, bit TMS is cleared to 0, meaning the block area is the destination.

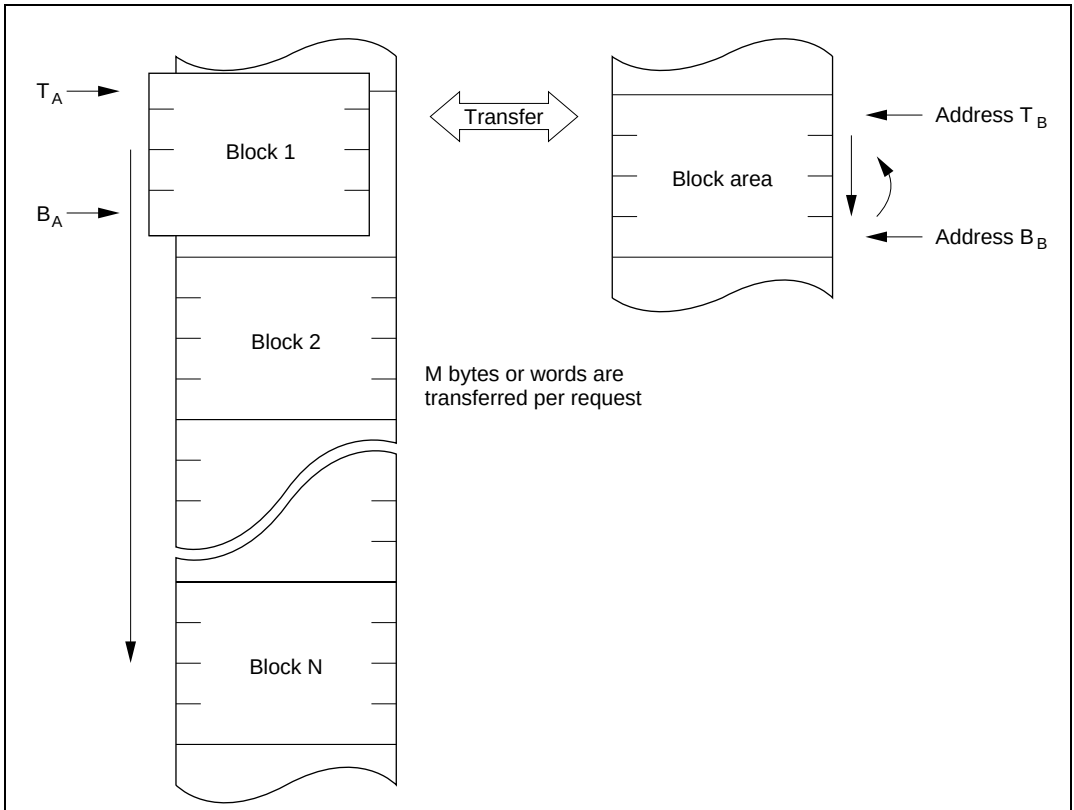


Figure 8.10 Operation in Block Transfer Mode

When activated by a transfer request, the DMAC executes a burst transfer. During the transfer MARA and MARB are updated according to the DTCR settings, and ETCRAH is decremented. When ETCRAH reaches H'00, it is reloaded from ETCRAL to restore the initial value. The memory address register of the block area is also restored to its initial value, and ETCRB is decremented. If ETCRB is not H'0000, the DMAC then waits for the next transfer request. ETCRAH and ETCRAL should be initially set to the same value.

The above operation is repeated until ETCRB reaches H'0000, at which point the DTE bit is cleared to 0 and the transfer ends. If the DTIE bit is set to 1, a CPU interrupt is requested at this time.

Figure 8.11 shows examples of a block transfer with byte data size when the block area is the destination. In (a) the block area address is cycled. In (b) the block area address is held fixed.

Transfers can be requested (activated) by compare match/input capture A interrupts from ITU channels 0 to 3, and by external request signals.

For the detailed settings see section 8.3.4, Data Transfer Control Registers (DTCR).

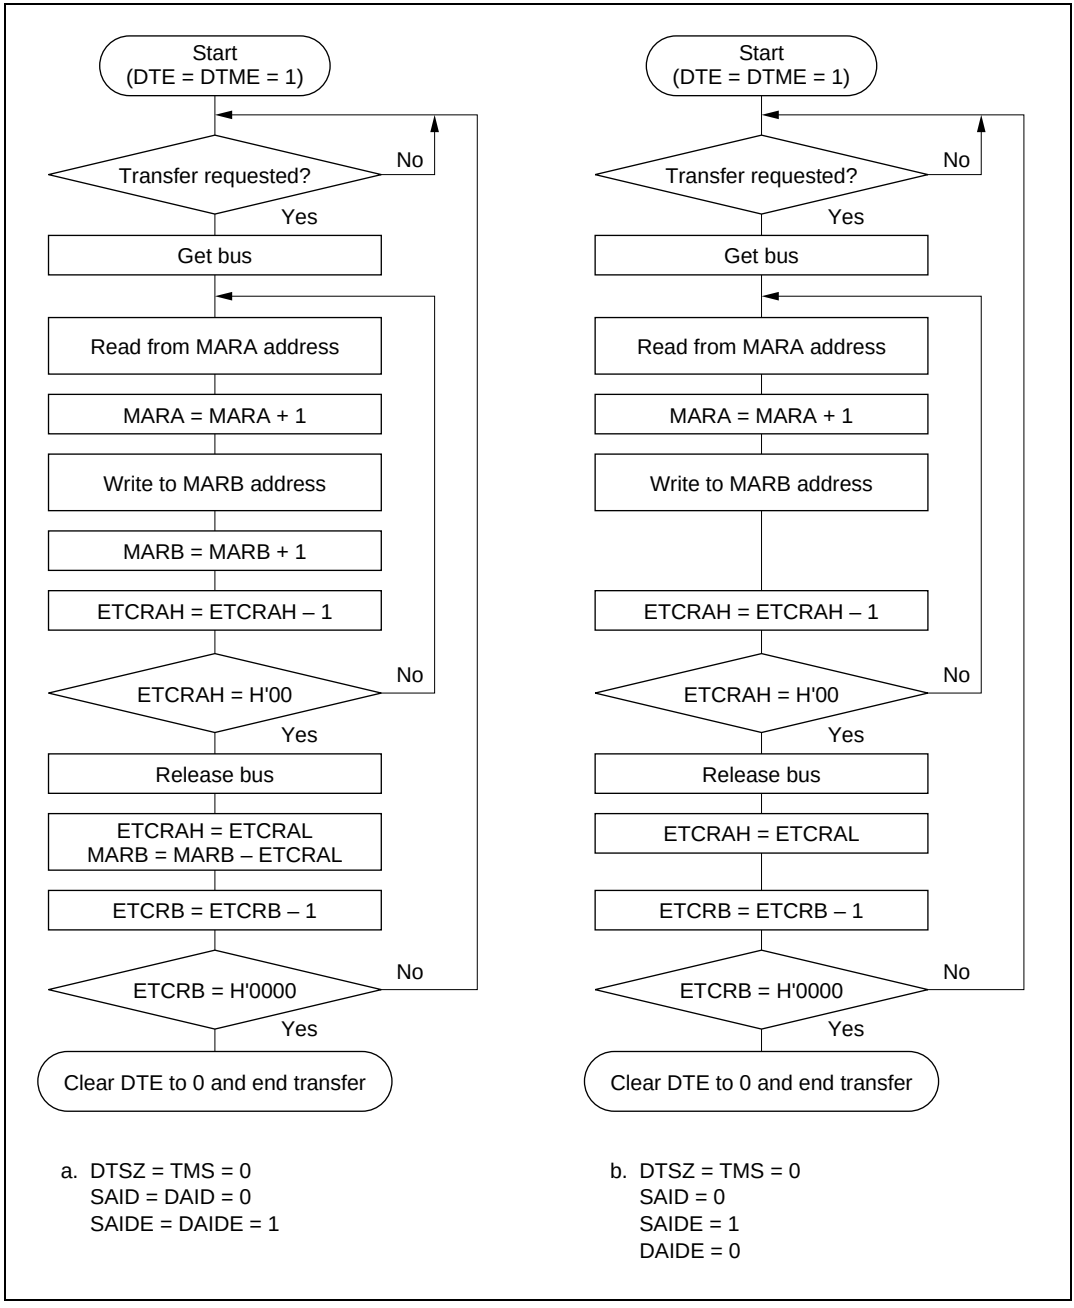

Figure 8.11 Block Transfer Mode Flowcharts (Examples)

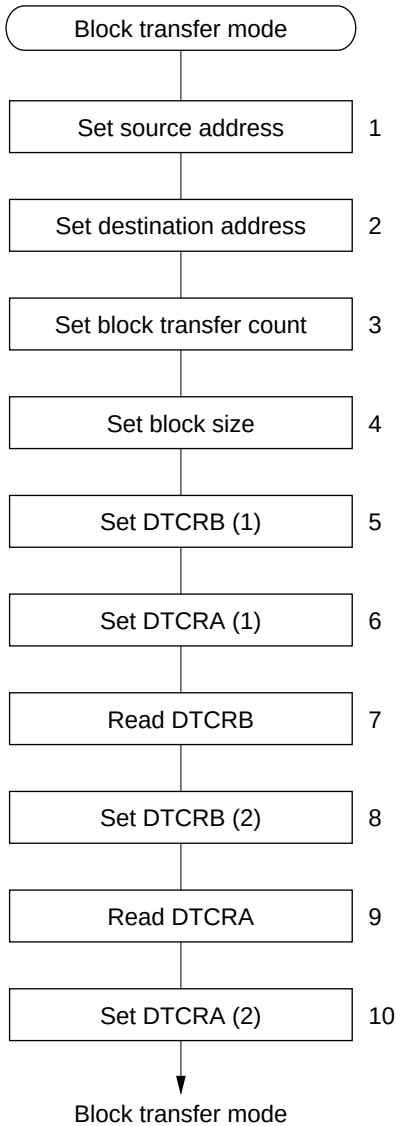
Figure 8.12 shows a sample setup procedure for block transfer mode.



1. Set the source address in MARA.
2. Set the destination address in MARB.
3. Set the block transfer count in ETCRB.
4. Set the block size (number of bytes or words) in both ETCRAH and ETCRAL.
5. Set the DTCRB bits as follows.
   - Clear the DTME bit to 0.
   - Set the DAID and DAIDE bits to select whether MARB is incremented, decremented, or held fixed.
   - Set or clear the TMS bit to make the block area the source or destination.
   - Select the DMAC activation source with bits DTS2B to DTS0B.
6. Set the DTCRA bits as follows.
   - Clear the DTE to 0.
   - Select byte size or word size with the DTSZ bit.
   - Set the SAID and SAIDE bits to select whether MARA is incremented, decremented, or held fixed.
   - Set or clear the DTIE bit to enable or disable the CPU interrupt at the end of the transfer.
   - Set bits DTS2A to DTS0A all to 1 to select block transfer mode.
7. Read DTCRB with DTME cleared to 0.
8. Set the DTME bit to 1 in DTCRB.
9. Read DTCRA with DTE cleared to 0.
10. Set the DTE bit to 1 in DTCRA to enable the transfer.

Note: Carry out settings 1 to 10 with the DEND interrupt masked in the CPU.
If an NMI interrupt occurs during the setup procedure, it may clear the DTME bit to 0, in which case the transfer will not start.

Figure 8.12 Block Transfer Mode Setup Procedure (Example)

8.4.7 DMAC Activation

The DMAC can be activated by an internal interrupt, external request, or auto-request. The available activation sources differ depending on the transfer mode and channel as indicated in table 8.11.

Table 8.11 DMAC Activation Sources

		Short Address Mode		Full Address Mode	
Activation Source		**Channels 0A and 1A**	**Channels 0B and 1B**	**Normal**	**Block**
Internal interrupts	IMIA0	Yes	Yes	No	Yes
	IMIA1	Yes	Yes	No	Yes
	IMIA2	Yes	Yes	No	Yes
	IMIA3	Yes	Yes	No	Yes
	TXI0	Yes	Yes	No	No
	RXI0	Yes	Yes	No	No
External requests	Falling edge of $\overline{\text{DREQ}}$	No	Yes	Yes	Yes
	Low input at $\overline{\text{DREQ}}$	No	Yes	Yes	No
Auto-request		No	No	Yes	No

Activation by Internal Interrupts: When an interrupt request is selected as a DMAC activation source and the DTE bit is set to 1, that interrupt request is not sent to the CPU. It is not possible for an interrupt request to activate the DMAC and simultaneously generate a CPU interrupt.

When the DMAC is activated by an interrupt request, the interrupt request flag is cleared automatically. If the same interrupt is selected to activate two or more channels, the interrupt request flag is cleared when the highest-priority channel is activated, but the transfer request is held pending on the other channels in the DMAC, which are activated in their priority order.

Activation by External Request: If an external request ($\overline{\text{DREQ}}$ pin) is selected as an activation source, the $\overline{\text{DREQ}}$ pin becomes an input pin and the corresponding $\overline{\text{TEND}}$ pin becomes an output pin, regardless of the port data direction register (DDR) settings. The $\overline{\text{DREQ}}$ input can be level-sensitive or edge-sensitive.

In short address mode and normal mode, an external request operates as follows. If edge sensing is selected, one byte or word is transferred each time a high-to-low transition of the $\overline{\text{DREQ}}$ input is detected. If the next edge is input before the transfer is completed, the next transfer may not be executed. If level sensing is selected, the transfer continues while $\overline{\text{DREQ}}$ is low, until the transfer is completed. The bus is released temporarily after each byte or word has been transferred, however. If the $\overline{\text{DREQ}}$ input goes high during a transfer, the transfer is suspended after the current byte or word has been transferred. When $\overline{\text{DREQ}}$ goes low, the request is held internally until one byte or word has been transferred. The $\overline{\text{TEND}}$ signal goes low during the last write cycle.

In block transfer mode, an external request operates as follows. Only edge-sensitive transfer requests are possible in block transfer mode. Each time a high-to-low transition of the $\overline{\text{DREQ}}$ input is detected, a block of the specified size is transferred. The $\overline{\text{TEND}}$ signal goes low during the last write cycle in each block.

Activation by Auto-Request: The transfer starts as soon as enabled by register setup, and continues until completed. Cycle-steal mode or burst mode can be selected.

In cycle-steal mode the DMAC releases the bus temporarily after transferring each byte or word. Normally, DMAC cycles alternate with CPU cycles.

In burst mode the DMAC keeps the bus until the transfer is completed, unless there is a higher-priority bus request. If there is a higher-priority bus request, the bus is released after the current byte or word has been transferred.

8.4.8 DMAC Bus Cycle

Figure 8.13 shows an example of the timing of the basic DMAC bus cycle. This example shows a word-size transfer from a 16-bit two-state access area to an 8-bit three-state access area. When the DMAC gets the bus from the CPU, after one dead cycle (Td), it reads from the source address and writes to the destination address. During these read and write operations the bus is not released even if there is another bus request. DMAC cycles comply with bus controller settings in the same way as CPU cycles.

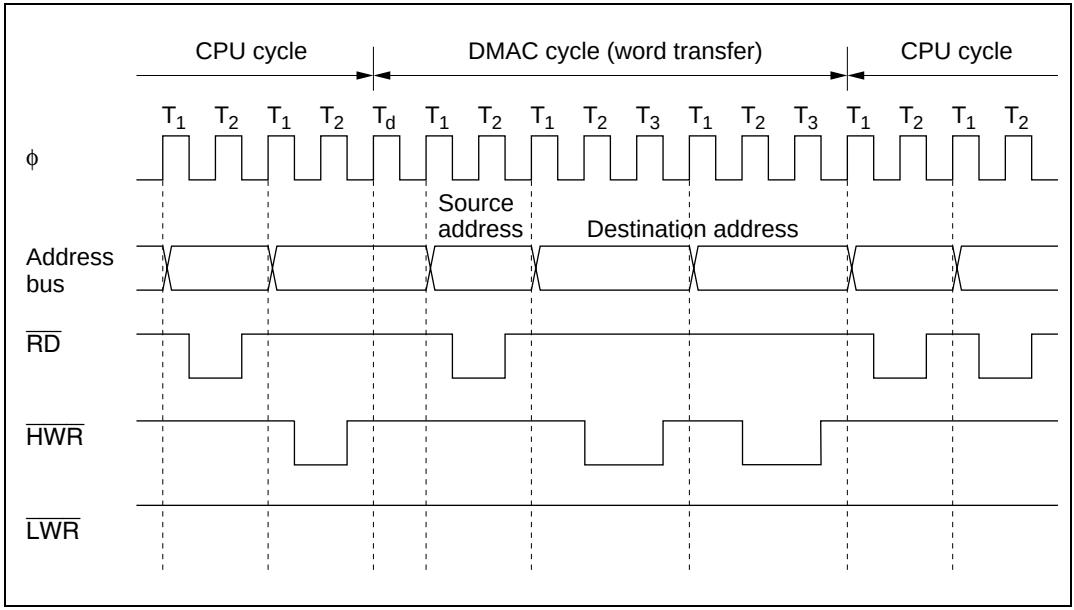


Figure 8.13 DMA Transfer Bus Timing (Example)

Figure 8.14 shows the timing when the DMAC is activated by low input at a $\overline{\text{DREQ}}$ pin. This example shows a word-size transfer from a 16-bit two-state access area to another 16-bit two-state access area. The DMAC continues the transfer while the $\overline{\text{DREQ}}$ pin is held low.

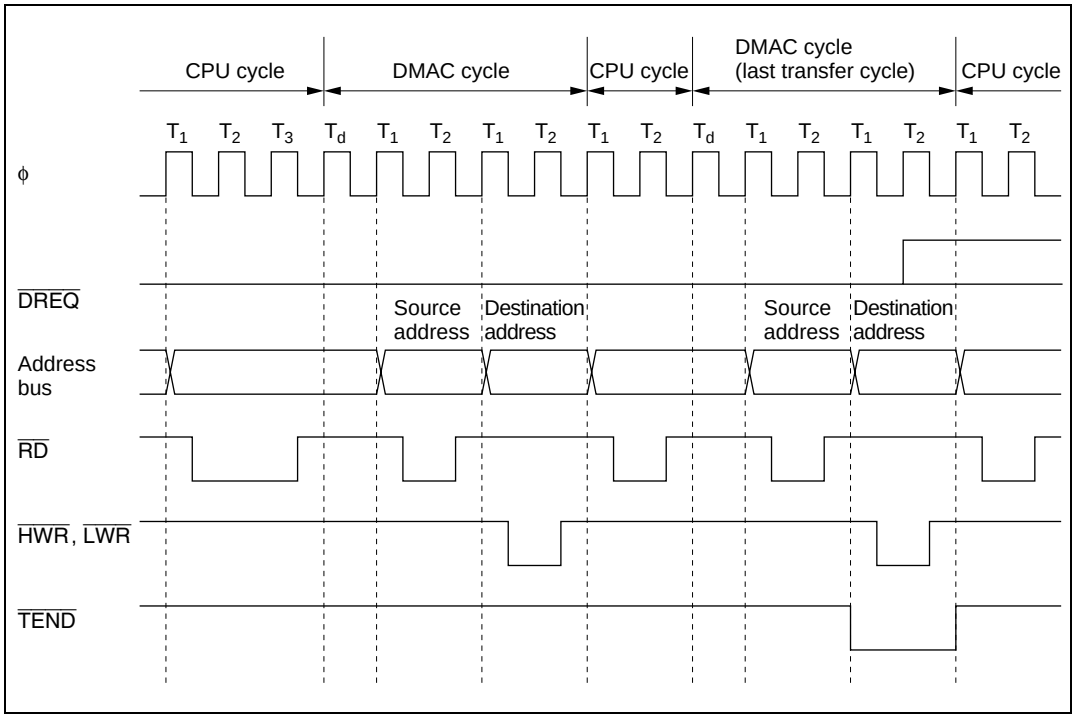

Figure 8.14 Bus Timing of DMA Transfer Requested by Low $\overline{\text{DREQ}}$ Input

Figure 8.15 shows an auto-requested burst-mode transfer. This example shows a transfer of three words from a 16-bit two-state access area to another 16-bit two-state access area.

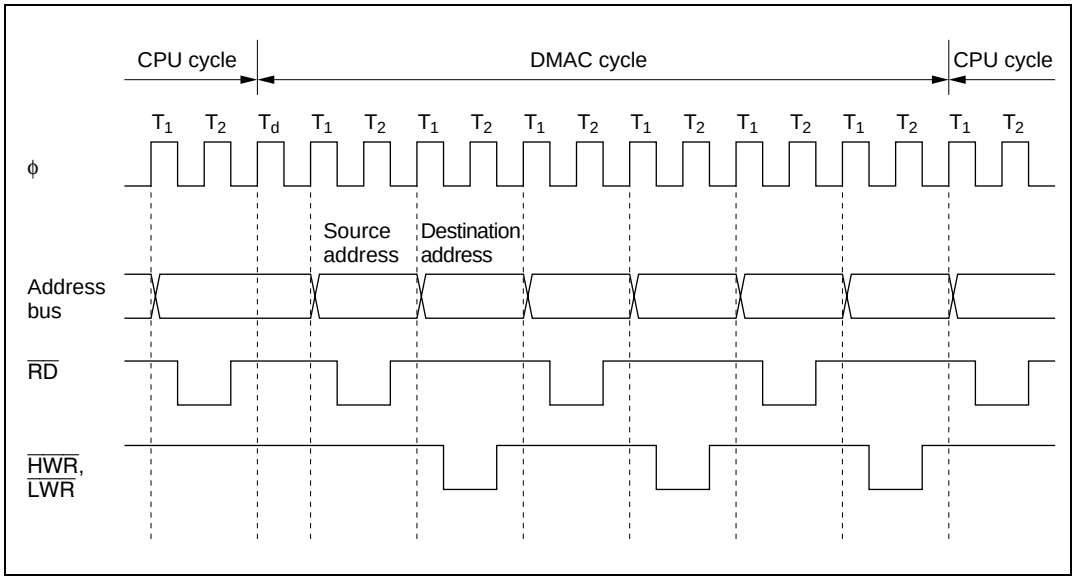

Figure 8.15 Burst DMA Bus Timing

When the DMAC is activated from a $\overline{\text{DREQ}}$ pin there is a minimum interval of four states from when the transfer is requested until the DMAC starts operating. The $\overline{\text{DREQ}}$ pin is not sampled during the time between the transfer request and the start of the transfer. In short address mode and normal mode, the pin is next sampled at the end of the read cycle. In block transfer mode, the pin is next sampled at the end of one block transfer.

Figure 8.16 shows the timing when the DMAC is activated by the falling edge of $\overline{\text{DREQ}}$ in normal mode.

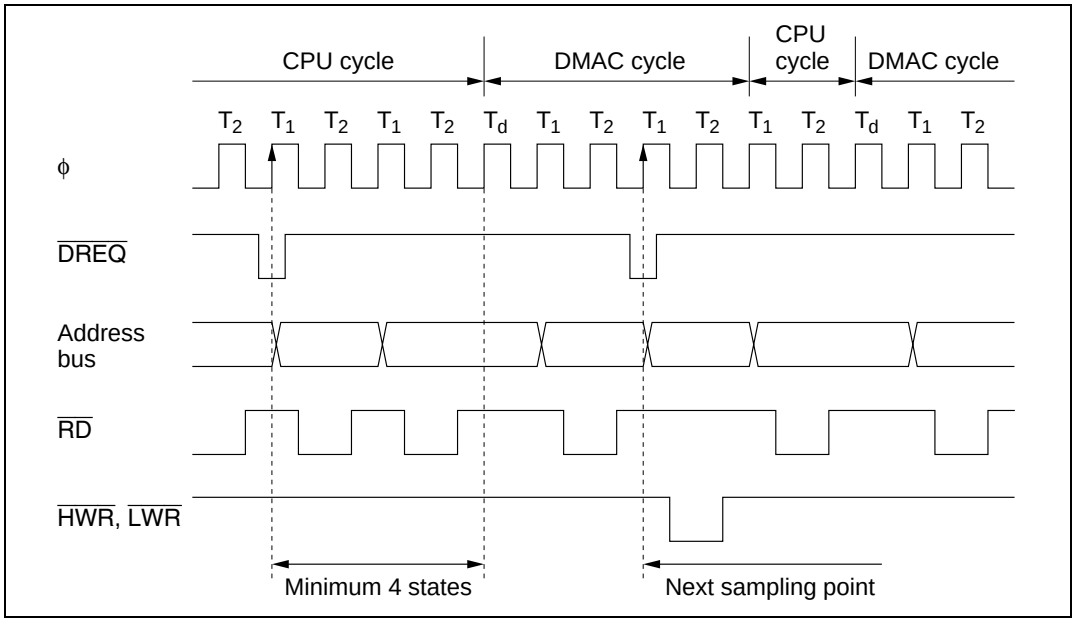

Figure 8.16 Timing of DMAC Activation by Falling Edge of $\overline{\text{DREQ}}$ in Normal Mode

Figure 8.17 shows the timing when the DMAC is activated by level-sensitive low $\overline{\text{DREQ}}$ input in normal mode.

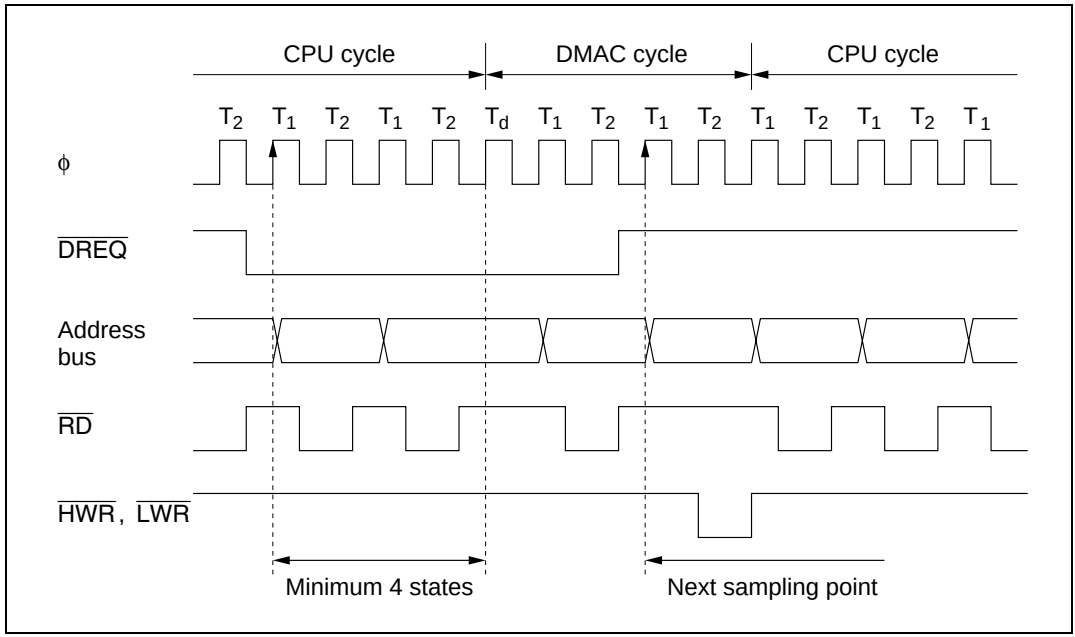

Figure 8.17 Timing of DMAC Activation by Low $\overline{\text{DREQ}}$ Level in Normal Mode

Figure 8.18 shows the timing when the DMAC is activated by the falling edge of $\overline{\text{DREQ}}$ in block transfer mode.

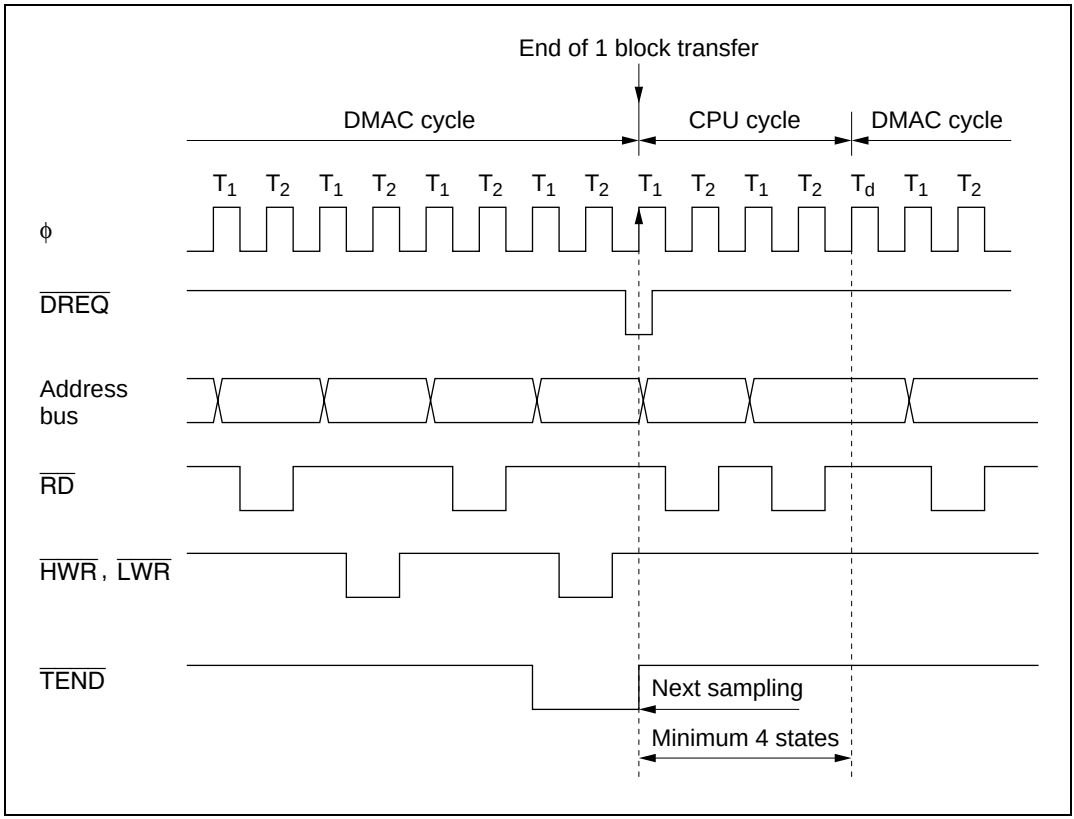

Figure 8.18 Timing of DMAC Activation by Falling Edge of $\overline{\text{DREQ}}$ in Block Transfer Mode

8.4.9 DMAC Multiple-Channel Operation

The DMAC channel priority order is: channel 0 > channel 1 and channel A > channel B.

Table 8.12 shows the complete priority order.

Table 8.12 Channel Priority Order

Short Address Mode	Full Address Mode	Priority
Channel 0A	Channel 0	High
Channel 0B		↑
Channel 1A	Channel 1	
Channel 1B		Low

If transfers are requested on two or more channels simultaneously, or if a transfer on one channel is requested during a transfer on another channel, the DMAC operates as follows.

1. When a transfer is requested, the DMAC requests the bus right. When it gets the bus right, it starts a transfer on the highest-priority channel at that time.
2. Once a transfer starts on one channel, requests to other channels are held pending until that channel releases the bus.
3. After each transfer in short address mode, and each externally-requested or cycle-steal transfer in normal mode, the DMAC releases the bus and returns to step 1. After releasing the bus, if there is a transfer request for another channel, the DMAC requests the bus again.
4. After completion of a burst-mode transfer, or after transfer of one block in block transfer mode, the DMAC releases the bus and returns to step 1. If there is a transfer request for a higher-priority channel or a bus request from a higher-priority bus master, however, the DMAC releases the bus after completing the transfer of the current byte or word. After releasing the bus, if there is a transfer request for another channel, the DMAC requests the bus again.

Figure 8.19 shows the timing when channel 0A is set up for I/O mode and channel 1 for burst mode, and a transfer request for channel 0A is received while channel 1 is active.

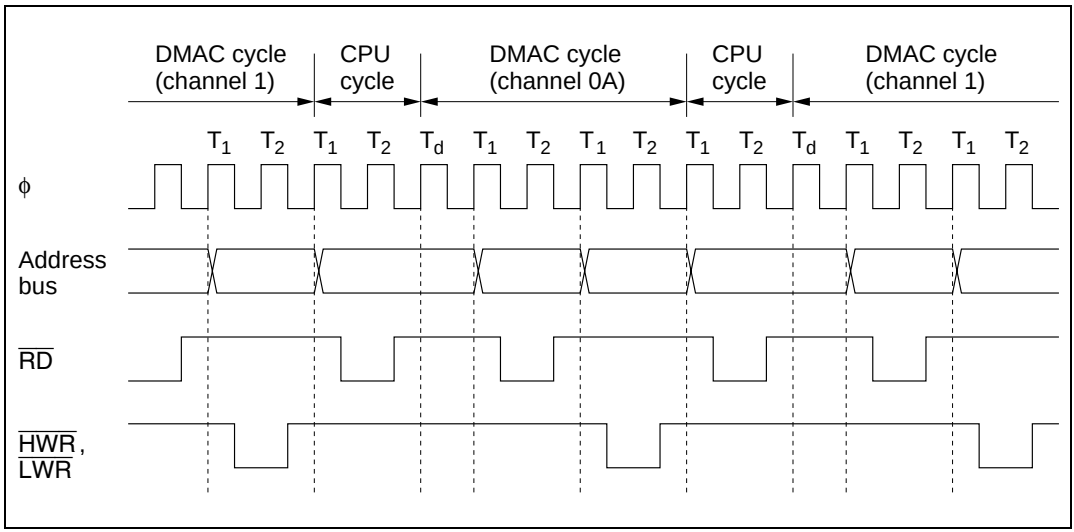

Figure 8.19 Timing of Multiple-Channel Operations

8.4.10 External Bus Requests, Refresh Controller, and DMAC

During a DMA transfer, if the bus right is requested by an external bus request signal ($\overline{\text{BREQ}}$) or by the refresh controller, the DMAC releases the bus after completing the transfer of the current byte or word. If there is a transfer request at this point, the DMAC requests the bus right again. Figure 8.20 shows an example of the timing of insertion of a refresh cycle during a burst transfer on channel 0.

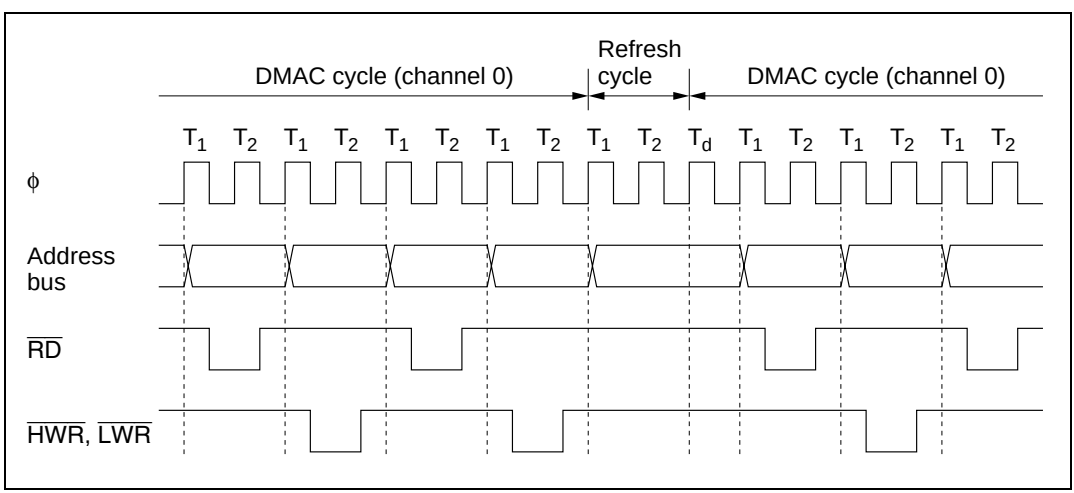

Figure 8.20 Bus Timing of Refresh Controller and DMAC

8.4.11 NMI Interrupts and DMAC

NMI interrupts do not affect DMAC operations in short address mode.

If an NMI interrupt occurs during a transfer in full address mode, the DMAC suspends operations. In full address mode, a channel is enabled when its DTE and DTME bits are both set to 1. NMI input clears the DTME bit to 0. After transferring the current byte or word, the DMAC releases the bus to the CPU. In normal mode, the suspended transfer resumes when the CPU sets the DTME bit to 1 again. Check that the DTE bit is set to 1 and the DTME bit is cleared to 0 before setting the DTME bit to 1.

Figure 8.21 shows the procedure for resuming a DMA transfer in normal mode on channel 0 after the transfer was halted by NMI input.

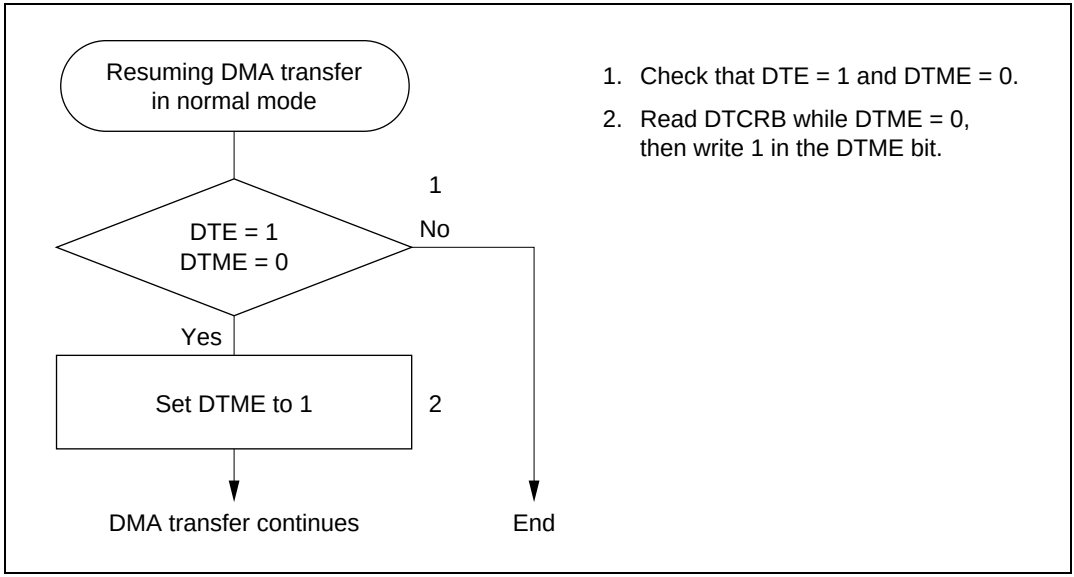

Figure 8.21 Procedure for Resuming a DMA Transfer Halted by NMI (Example)

For information about NMI interrupts in block transfer mode, see section 8.6.6, NMI Interrupts and Block Transfer Mode.

8.4.12 Aborting a DMA Transfer

When the DTE bit in an active channel is cleared to 0, the DMAC halts after transferring the current byte or word. The DMAC starts again when the DTE bit is set to 1. In full address mode, the DTME bit can be used for the same purpose. Figure 8.22 shows the procedure for aborting a DMA transfer by software.

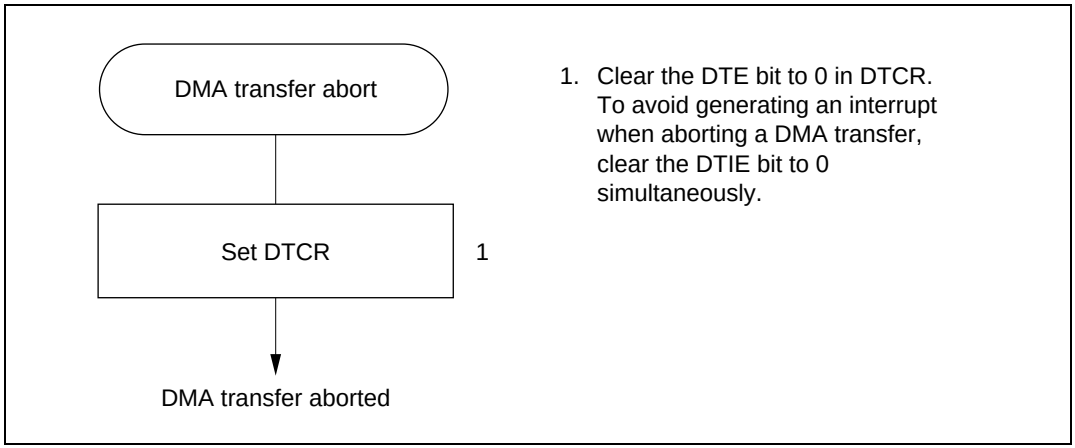

Figure 8.22 Procedure for Aborting a DMA Transfer

8.4.13 Exiting Full Address Mode

Figure 8.23 shows the procedure for exiting full address mode and initializing the pair of channels. To set the channels up in another mode after exiting full address mode, follow the setup procedure for the relevant mode.

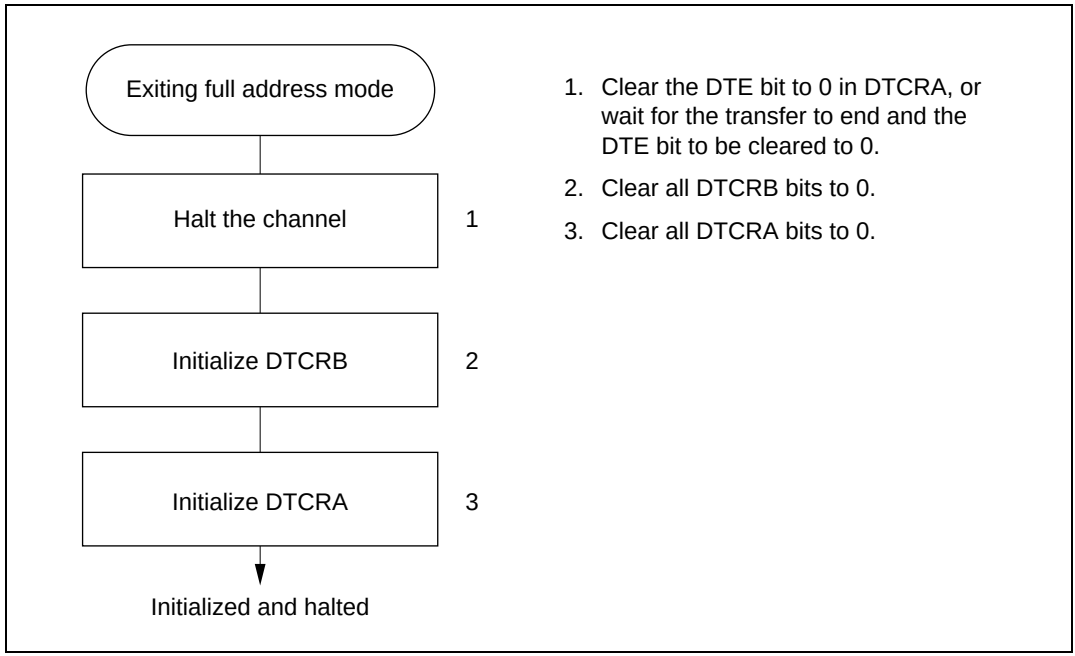

Figure 8.23 Procedure for Exiting Full Address Mode (Example)

8.4.14 DMAC States in Reset State, Standby Modes, and Sleep Mode

When the chip is reset or enters hardware or software standby mode, the DMAC is initialized and halts. DMAC operations continue in sleep mode. Figure 8.24 shows the timing of a cycle-steal transfer in sleep mode.

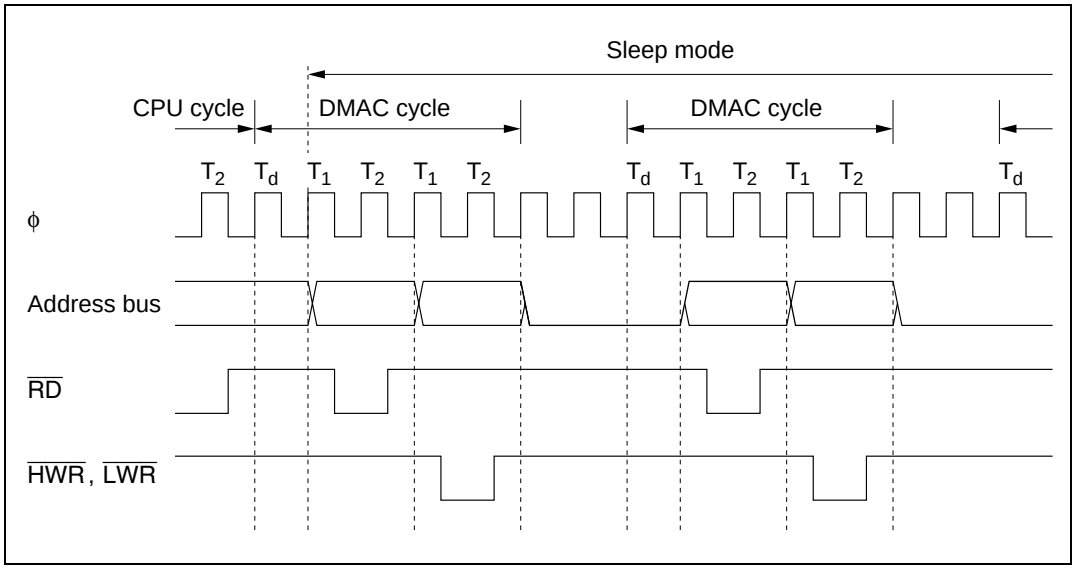

Figure 8.24 Timing of Cycle-Steal Transfer in Sleep Mode

8.5 Interrupts

The DMAC generates only DMA-end interrupts. Table 8.13 lists the interrupts and their priority.

Table 8.13 DMAC Interrupts

Interrupt	Description		Interrupt Priority
	Short Address Mode	Full Address Mode	
DEND0A	End of transfer on channel 0A	End of transfer on channel 0	High
DEND0B	End of transfer on channel 0B	—	↑
DEND1A	End of transfer on channel 1A	End of transfer on channel 1	
DEND1B	End of transfer on channel 1B	—	Low

Each interrupt is enabled or disabled by the DTIE bit in the corresponding data transfer control register (DTCR). Separate interrupt signals are sent to the interrupt controller.

The interrupt priority order among channels is channel 0 > channel 1 and channel A > channel B.

Figure 8.25 shows the DMA-end interrupt logic. An interrupt is requested whenever DTE = 0 and DTIE = 1.

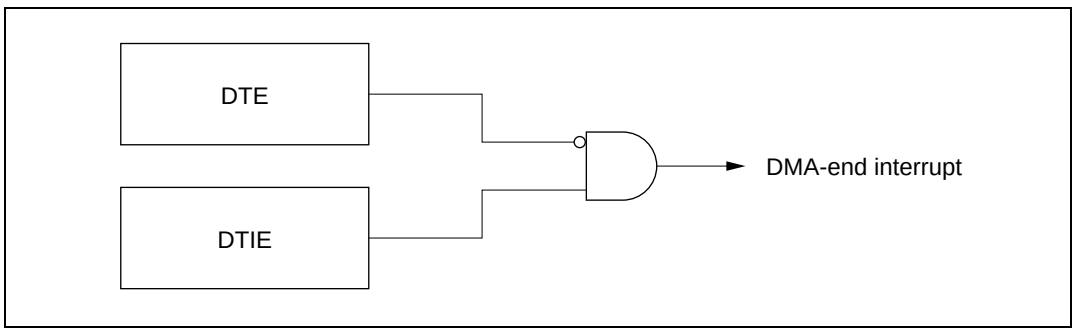

Figure 8.25 DMA-End Interrupt Logic

The DMA-end interrupt for the B channels (DENDB) is unavailable in full address mode. The DTME bit does not affect interrupt operations.

8.6 Usage Notes

8.6.1 Note on Word Data Transfer

Word data cannot be accessed starting at an odd address. When word-size transfer is selected, set even values in the memory and I/O address registers (MAR and IOAR).

8.6.2 DMAC Self-Access

The DMAC itself cannot be accessed during a DMAC cycle. DMAC registers cannot be specified as source or destination addresses.

8.6.3 Longword Access to Memory Address Registers

A memory address register can be accessed as longword data at the MARR address.

Example

```
MOV.L  #LBL, ER0
MOV.L  ER0, @MARR
```

Four byte accesses are performed. Note that the CPU may release the bus between the second byte (MARE) and third byte (MARH).

Memory address registers should be written and read only when the DMAC is halted.

8.6.4 Note on Full Address Mode Setup

Full address mode is controlled by two registers: DTCRA and DTCRB. Care must be taken to prevent the B channel from operating in short address mode during the register setup. The enable bits (DTE and DTME) should not be set to 1 until the end of the setup procedure.

8.6.5 Note on Activating DMAC by Internal Interrupts

When using an internal interrupt to activate the DMAC, make sure that the interrupt selected as the activating source does not occur during the interval after it has been selected but before the DMAC has been enabled. The on-chip supporting module that will generate the interrupt should not be activated until the DMAC has been enabled. If the DMAC must be enabled while the on-chip supporting module is active, follow the procedure in figure 8.26.

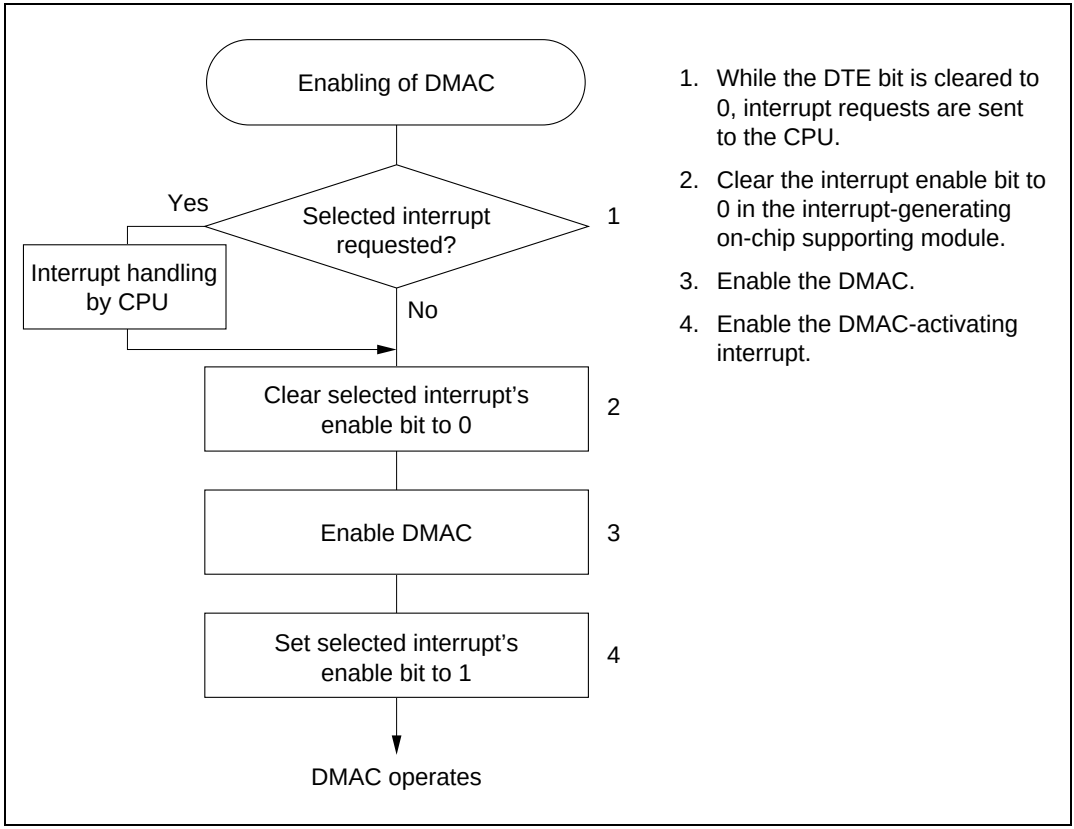

Figure 8.26 Procedure for Enabling DMAC while On-Chip Supporting Module Is Operating (Example)

If the DTE bit is set to 1 but the DTME bit is cleared to 0, the DMAC is halted and the selected activating source cannot generate a CPU interrupt. If the DMAC is halted by an NMI interrupt, for example, the selected activating source cannot generate CPU interrupts. To terminate DMAC operations in this state, clear the DTE bit to 0 to allow CPU interrupts to be requested. To continue DMAC operations, carry out steps 2 and 4 in figure 8.26 before and after setting the DTME bit to 1.

When an ITU interrupt activates the DMAC, make sure the next interrupt does not occur before the DMA transfer ends. If one ITU interrupt activates two or more channels, make sure the next interrupt does not occur before the DMA transfers end on all the activated channels. If the next interrupt occurs before a transfer ends, the channel or channels for which that interrupt was selected may fail to accept further activation requests.

8.6.6 NMI Interrupts and Block Transfer Mode

If an NMI interrupt occurs in block transfer mode, the DMAC operates as follows.

- When the NMI interrupt occurs, the DMAC finishes transferring the current byte or word, then clears the DTME bit to 0 and halts. The halt may occur in the middle of a block.

  It is possible to find whether a transfer was halted in the middle of a block by checking the block size counter. If the block size counter does not have its initial value, the transfer was halted in the middle of a block.
- If the transfer is halted in the middle of a block, the activating interrupt flag is cleared to 0. The activation request is not held pending.
- While the DTE bit is set to 1 and the DTME bit is cleared to 0, the DMAC is halted and does not accept activating interrupt requests. If an activating interrupt occurs in this state, the DMAC does not operate and does not hold the transfer request pending internally. Neither is a CPU interrupt requested.

  For this reason, before setting the DTME bit to 1, first clear the enable bit of the activating interrupt to 0. Then, after setting the DTME bit to 1, set the interrupt enable bit to 1 again. See section 8.6.5, Note on Activating DMAC by Internal Interrupts.
- When the DTME bit is set to 1, the DMAC waits for the next transfer request. If it was halted in the middle of a block transfer, the rest of the block is transferred when the next transfer request occurs. Otherwise, the next block is transferred when the next transfer request occurs.

8.6.7 Memory and I/O Address Register Values

Table 8.14 indicates the address ranges that can be specified in the memory and I/O address registers (MAR and IOAR).

Table 8.14 Address Ranges Specifiable in MAR and IOAR

	1-Mbyte Mode	16-Mbyte Mode
MAR	H'00000 to H'FFFFF (0 to 1048575)	H'000000 to H'FFFFFF (0 to 16777215)
IOAR	H'FFF00 to H'FFFFF (1048320 to 1048575)	H'FFFF00 to H'FFFFFF (16776960 to 16777215)

MAR bits 23 to 20 are ignored in 1-Mbyte mode.

8.6.8 Bus Cycle when Transfer Is Aborted

When a transfer is aborted by clearing the DTE bit or suspended by an NMI that clears the DTME bit, if this halts a channel for which the DMAC has a transfer request pending internally, a dead cycle may occur. This dead cycle does not update the halted channel's address register or counter value. Figure 8.27 shows an example in which an auto-requested transfer in cycle-steal mode on channel 0 is aborted by clearing the DTE bit in channel 0.

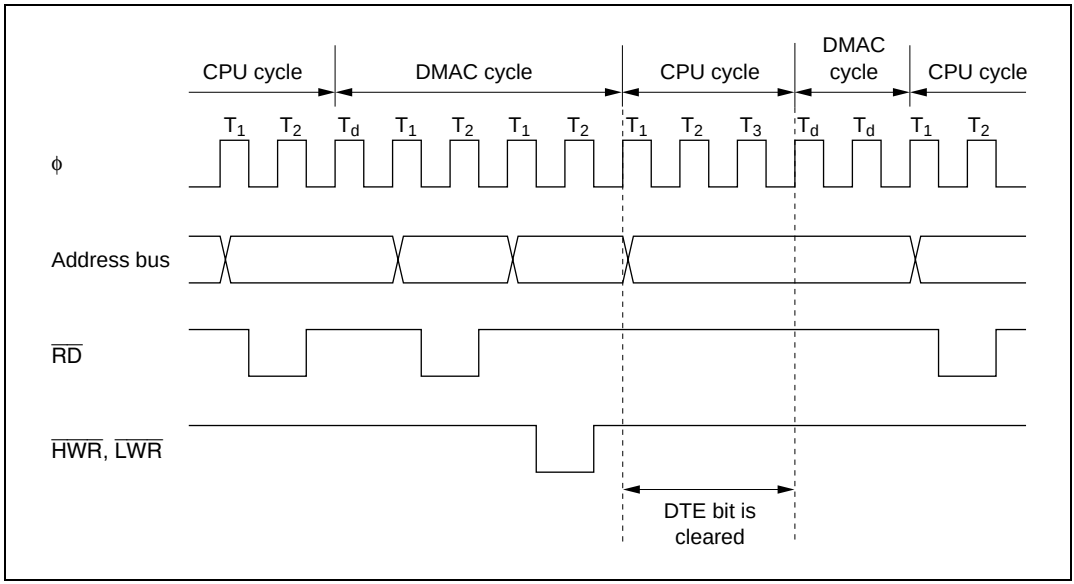

Figure 8.27 Bus Timing at Abort of DMA Transfer in Cycle-Steal Mode

Section 9 I/O Ports

9.1 Overview

The H8/3052BF has 10 input/output ports (ports 1, 2, 3, 4, 5, 6, 8, 9, A, and B) and one input port (port 7). Table 9.1 summarizes the port functions. The pins in each port are multiplexed as shown in table 9.1.

Each port has a data direction register (DDR) for selecting input or output, and a data register (DR) for storing output data. In addition to these registers, ports 2, 4, and 5 have an input pull-up MOS control register (PCR) for switching input pull-up MOS transistors on and off.

Ports 1 to 6 and port 8 can drive one TTL load and a 90-pF capacitive load. Ports 9, A, and B can drive one TTL load and a 30-pF capacitive load. Ports 1 to 6 and 8 to B can drive a darlington pair. Ports 1, 2, 5, and B can drive LEDs (with 10-mA current sink). Pins $P8_2$ to $P8_0$, PA_7 to PA_0, and PB_3 to PB_0 have Schmitt-trigger input circuits.

For block diagrams of the ports see appendix C, I/O Port Block Diagrams.

Table 9.1 Port Functions

Port	Description	Pins	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
Port 1	• 8-bit I/O port • Can drive LEDs	$P1_7$ to $P1_0$/ A_7 to A_0	Address output pins (A_7 to A_0)				Address output (A_7 to A_0) and generic input DDR = 0: generic input DDR = 1: address output		Generic input/ output
Port 2	• 8-bit I/O port • Input pull-up MOS • Can drive LEDs	$P2_7$ to $P2_0$/ A_{15} to A_8	Address output pins (A_{15} to A_8)				Address output (A_{15} to A_8) and generic input DDR = 0: generic input DDR = 1: address output		Generic input/ output
Port 3	• 8-bit I/O port	$P3_7$ to $P3_0$/ D_{15} to D_8	Data input/output (D_{15} to D_8)						Generic input/ output
Port 4	• 8-bit I/O port • Input pull-up MOS	$P4_7$ to $P4_0$/ D_7 to D_0	Data input/output (D_7 to D_0) and 8-bit generic input/output 8-bit bus mode: generic input/output 16-bit bus mode: data input/output						Generic input/ output
Port 5	• 4-bit I/O port • Input pull-up MOS • Can drive LEDs	$P5_3$ to $P5_0$/ A_{19} to A_{16}	Address output (A_{19} to A_{16})				Address output (A_{19} to A_{16}) and 4-bit generic input DDR = 0: generic input DDR = 1: address output		Generic input/ output
Port 6	• 7-bit I/O port	$P6_6$/$\overline{LWR}$, $P6_5$/$\overline{HWR}$, $P6_4$/$\overline{RD}$, $P6_3$/$\overline{AS}$	Bus control signal output ($\overline{LWR}$, $\overline{HWR}$, $\overline{RD}$, $\overline{AS}$)						Generic input/ output
		$P6_2$/$\overline{BACK}$, $P6_1$/$\overline{BREQ}$, $P6_0$/$\overline{WAIT}$	Bus control signal input/output ($\overline{BACK}$, $\overline{BREQ}$, $\overline{WAIT}$) and 3-bit generic input/output						
Port 7	• o8-bit I/O port	$P7_7$/AN_7/DA_1, $P7_6$/AN_6/DA_0	Analog input (AN_7, AN_6) to A/D converter, analog output (DA_1, DA_0) from D/A converter, and generic input						
		$P7_5$ to $P7_0$/ AN_5 to AN_0	Analog input (AN_5 to AN_0) to A/D converter, and generic input						

Port	Description	Pins	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
Port 8	• 5-bit I/O port • $P8_2$ to $P8_0$ have Schmitt inputs	$P8_4/\overline{CS_0}$	DDR = 0: generic input DDR = 1 (reset value): $\overline{CS_0}$ output						Generic input/ output

9.2 Port 1

9.2.1 Overview

Port 1 is an 8-bit input/output port with the pin configuration shown in figure 9.1. The pin functions differ between the expanded modes with on-chip ROM disabled, expanded modes with on-chip ROM enabled, and single-chip mode. In modes 1 to 4 (expanded modes with on-chip ROM disabled), they are address bus output pins (A_7 to A_0).

In modes 5 and 6 (expanded modes with on-chip ROM enabled), settings in the port 1 data direction register (P1DDR) can designate pins for address bus output (A_7 to A_0) or generic input. In mode 7 (single-chip mode), port 1 is a generic input/output port.

When DRAM is connected to area 3, A_7 to A_0 output row and column addresses in read and write cycles. For details see section 7, Refresh Controller.

Pins in port 1 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

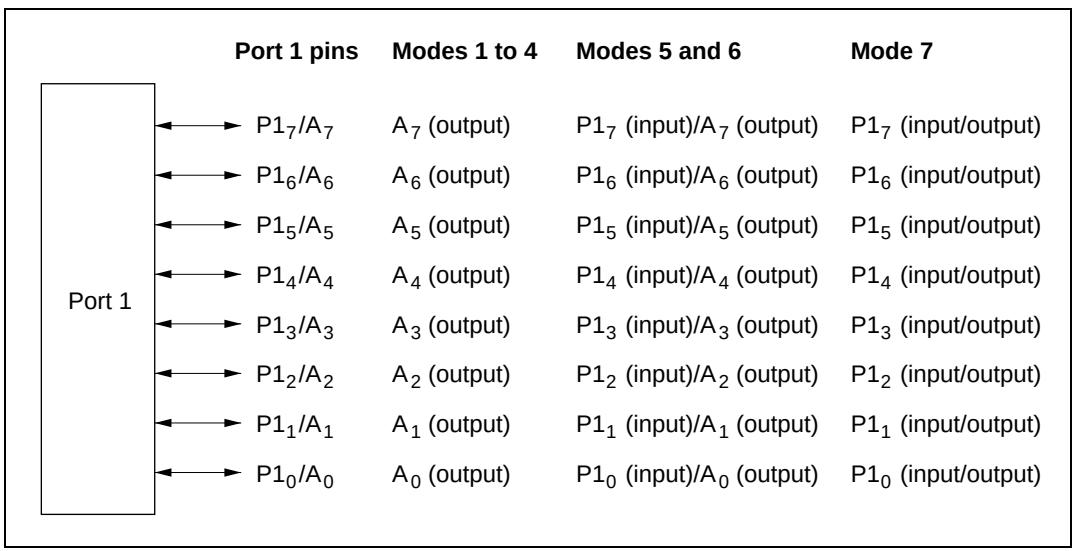

Figure 9.1 Port 1 Pin Configuration

9.2.2 Register Configuration

Table 9.2 summarizes the registers of port 1.

Table 9.2 Port 1 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'FFC0	Port 1 data direction register	P1DDR	W	H'FF	H'00
H'FFC2	Port 1 data register	P1DR	R/W	H'00	H'00

Note: * Lower 16 bits of the address.

Port 1 Data Direction Register (P1DDR)

P1DDR is an 8-bit write-only register that can select input or output for each pin in port 1.

Bit		7	6	5	4	3	2	1	0
		$P1_7DDR$	$P1_6DDR$	$P1_5DDR$	$P1_4DDR$	$P1_3DDR$	$P1_2DDR$	$P1_1DDR$	$P1_0DDR$
Modes 1 to 4	Initial value	1	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W	W

Port 1 data direction 7 to 0
These bits select input or output for port 1 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)
  P1DDR values are fixed at 1 and cannot be modified. Port 1 functions as an address bus.
- Modes 5 and 6 (Expanded Modes with On-Chip ROM Enabled)
  A pin in port 1 becomes an address output pin if the corresponding P1DDR bit is set to 1, and a generic input pin if this bit is cleared to 0.
- Mode 7 (Single-Chip Mode)
  Port 1 functions as an input/output port. A pin in port 1 becomes an output pin if the corresponding P1DDR bit is set to 1, and an input pin if this bit is cleared to 0.

In modes 5 to 7, P1DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P1DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P1DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 1 Data Register (P1DR)

P1DR is an 8-bit readable/writable register that stores port 1 output data. When this register is read, the pin logic level of a pin is read for bits for which the P1DDR setting is 0, and the P1DR value is read for bits for which the P1DDR setting is 1.

Bit	7	6	5	4	3	2	1	0
	$P1_7$	$P1_6$	$P1_5$	$P1_4$	$P1_3$	$P1_2$	$P1_1$	$P1_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 1 data 7 to 0
These bits store data for port 1 pins

P1DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

9.3 Port 2

9.3.1 Overview

Port 2 is an 8-bit input/output port with the pin configuration shown in figure 9.2. The pin functions differ according to the operating mode.

In modes 1 to 4 (expanded modes with on-chip ROM disabled), port 2 consists of address bus output pins (A_{15} to A_8). In modes 5 and 6 (expanded modes with on-chip ROM enabled), settings in the port 2 data direction register (P2DDR) can designate pins for address bus output (A_{15} to A_8) or generic input. In mode 7 (single-chip mode), port 2 is a generic input/output port.

When DRAM is connected to area 3, A_9 and A_8 output row and column addresses in read and write cycles. For details see section 7, Refresh Controller.

Port 2 has software-programmable built-in pull-up MOS. Pins in port 2 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

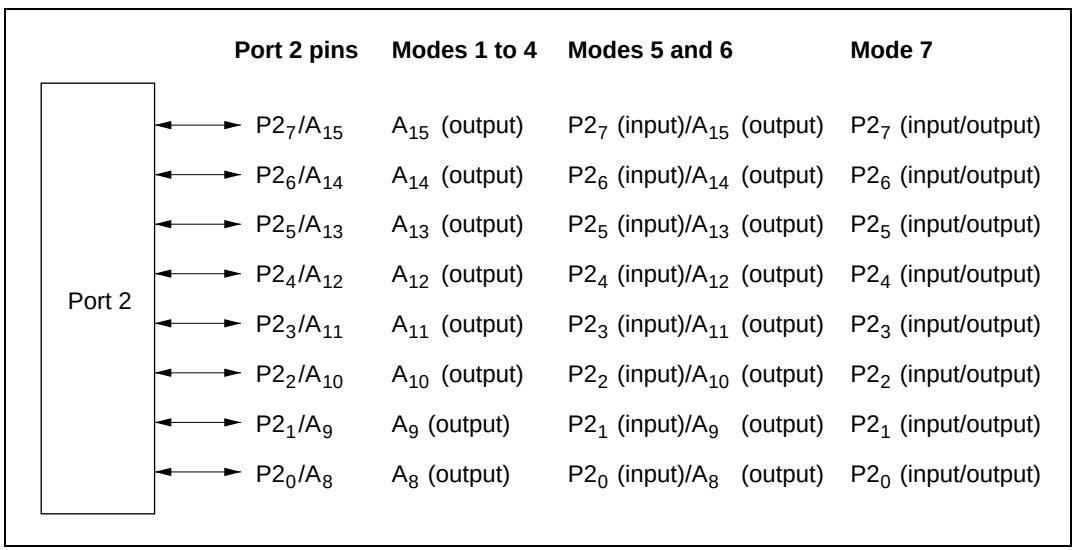

Figure 9.2 Port 2 Pin Configuration

9.3.2 Register Configuration

Table 9.3 summarizes the registers of port 2.

Table 9.3 Port 2 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'FFC1	Port 2 data direction register	P2DDR	W	H'FF	H'00
H'FFC3	Port 2 data register	P2DR	R/W	H'00	H'00
H'FFD8	Port 2 input pull-up MOS control register	P2PCR	R/W	H'00	H'00

Note: * Lower 16 bits of the address.

Port 2 Data Direction Register (P2DDR)

P2DDR is an 8-bit write-only register that can select input or output for each pin in port 2.

Bit		7	6	5	4	3	2	1	0
		$P2_7DDR$	$P2_6DDR$	$P2_5DDR$	$P2_4DDR$	$P2_3DDR$	$P2_2DDR$	$P2_1DDR$	$P2_0DDR$
Modes 1 to 4	Initial value	1	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W	W

Port 2 data direction 7 to 0
These bits select input or output for port 2 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)
  P2DDR values are fixed at 1 and cannot be modified. Port 2 functions as an address bus.
- Modes 5 and 6 (Expanded Modes with On-Chip ROM Enabled)
  Following a reset, port 2 is an input port. A pin in port 2 becomes an address output pin if the corresponding P2DDR bit is set to 1, and a generic input port if this bit is cleared to 0.
- Mode 7 (Single-Chip Mode)
  Port 2 functions as an input/output port. A pin in port 2 becomes an output port if the corresponding P2DDR bit is set to 1, and an input port if this bit is cleared to 0.

In modes 5 to 7, P2DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P2DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P2DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 2 Data Register (P2DR)

P2DR is an 8-bit readable/writable register that stores output data for pins $P2_7$ to $P2_0$. When a bit in P2DDR is set to 1, if port 2 is read the value of the corresponding P2DR bit is returned. When a bit in P2DDR is cleared to 0, if port 2 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	$P2_7$	$P2_6$	$P2_5$	$P2_4$	$P2_3$	$P2_2$	$P2_1$	$P2_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 data 7 to 0
These bits store data for port 2 pins

P2DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 2 Input Pull-Up MOS Control Register (P2PCR)

P2PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 2.

Bit	7	6	5	4	3	2	1	0
	$P2_7$PCR	$P2_6$PCR	$P2_5$PCR	$P2_4$PCR	$P2_3$PCR	$P2_2$PCR	$P2_1$PCR	$P2_0$PCR
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 input pull-up MOS control 7 to 0
These bits control input pull-up transistors built into port 2

In modes 5 to 7, when a P2DDR bit is cleared to 0 (selecting generic input), if the corresponding bit from $P2_7$PCR to $P2_0$PCR is set to 1, the input pull-up MOS is turned on.

P2PCR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.4 Input Pull-Up MOS States (Port 2)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1	Off	Off	Off	Off
2				
3				
4				
5	Off	Off	On/off	On/off
6				
7				

Legend:
Off: The input pull-up MOS is always off.
On/off: The input pull-up MOS is on if P2PCR = 1 and P2DDR = 0. Otherwise, it is off.

9.4 Port 3

9.4.1 Overview

Port 3 is an 8-bit input/output port with the pin configuration shown in figure 9.3. Port 3 is a data bus in modes 1 to 6 (expanded modes) and a generic input/output port in mode 7 (single-chip mode).

Pins in port 3 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

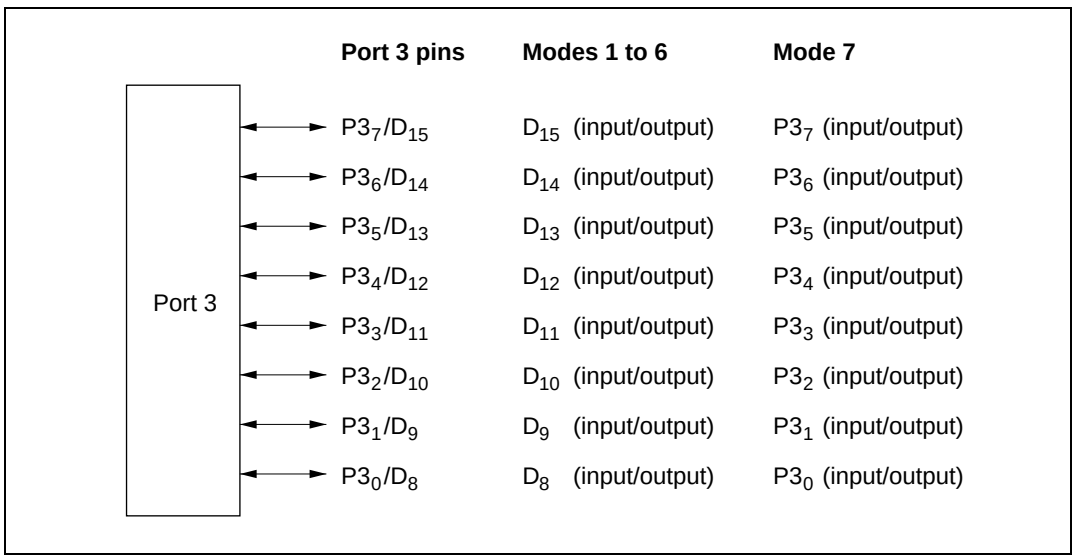

Figure 9.3 Port 3 Pin Configuration

9.4.2 Register Configuration

Table 9.5 summarizes the registers of port 3.

Table 9.5 Port 3 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC4	Port 3 data direction register	P3DDR	W	H'00
H'FFC6	Port 3 data register	P3DR	R/W	H'00

Note: * Lower 16 bits of the address.

Port 3 Data Direction Register (P3DDR)

P3DDR is an 8-bit write-only register that can select input or output for each pin in port 3.

Bit	7	6	5	4	3	2	1	0
	$P3_7DDR$	$P3_6DDR$	$P3_5DDR$	$P3_4DDR$	$P3_3DDR$	$P3_2DDR$	$P3_1DDR$	$P3_0DDR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 3 data direction 7 to 0
These bits select input or output for port 3 pins

- Modes 1 to 6 (Expanded Modes)
  Port 3 functions as a data bus. P3DDR is ignored.
- Mode 7 (Single-Chip Mode)
  Port 3 functions as an input/output port. A pin in port 3 becomes an output port if the corresponding P3DDR bit is set to 1, and an input port if this bit is cleared to 0.

P3DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P3DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P3DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 3 Data Register (P3DR)

P3DR is an 8-bit readable/writable register that stores output data for pins $P3_7$ to $P3_0$. When a bit in P3DDR is set to 1, if port 3 is read the value of the corresponding P3DR bit is returned. When a bit in P3DDR is cleared to 0, if port 3 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	$P3_7$	$P3_6$	$P3_5$	$P3_4$	$P3_3$	$P3_2$	$P3_1$	$P3_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 3 data 7 to 0
These bits store data for port 3 pins

P3DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

9.5 Port 4

9.5.1 Overview

Port 4 is an 8-bit input/output port with the pin configuration shown in figure 9.4. The pin functions differ according to the operating mode.

In modes 1 to 6 (expanded modes), when the bus width control register (ABWCR) designates areas 0 to 7 all as 8-bit-access areas, the chip operates in 8-bit bus mode and port 4 is a generic input/output port. When at least one of areas 0 to 7 is designated as a 16-bit-access area, the chip operates in 16-bit bus mode and port 4 becomes part of the data bus. In mode 7 (single-chip mode), port 4 is a generic input/output port.

Port 4 has software-programmable built-in pull-up MOS.

Pins in port 4 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

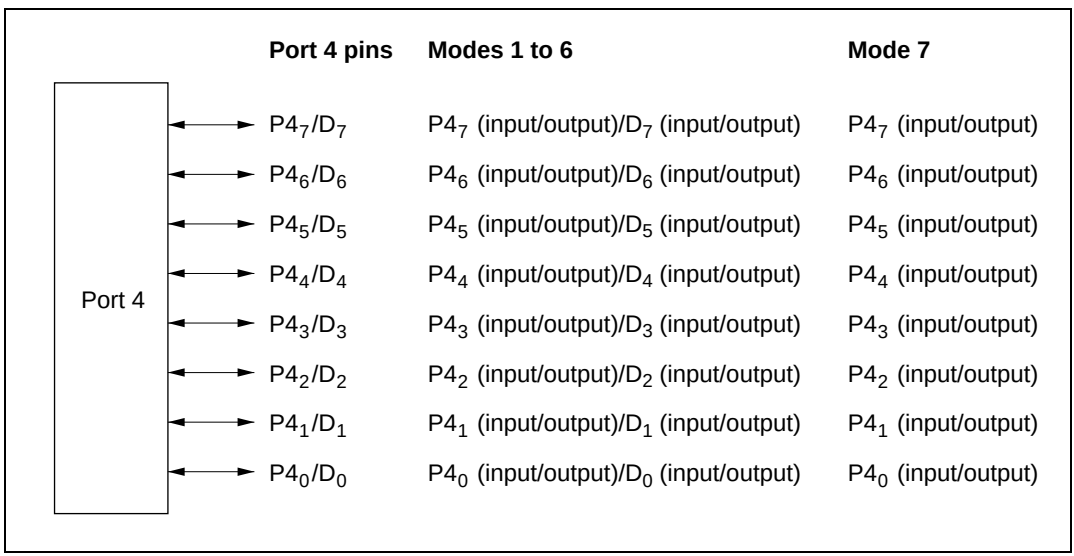

Figure 9.4 Port 4 Pin Configuration

9.5.2 Register Configuration

Table 9.6 summarizes the registers of port 4.

Table 9.6 Port 4 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC5	Port 4 data direction register	P4DDR	W	H'00
H'FFC7	Port 4 data register	P4DR	R/W	H'00
H'FFDA	Port 4 input pull-up MOS control register	P4PCR	R/W	H'00

Note: * Lower 16 bits of the address.

Port 4 Data Direction Register (P4DDR)

P4DDR is an 8-bit write-only register that can select input or output for each pin in port 4.

Bit	7	6	5	4	3	2	1	0
	$P4_7DDR$	$P4_6DDR$	$P4_5DDR$	$P4_4DDR$	$P4_3DDR$	$P4_2DDR$	$P4_1DDR$	$P4_0DDR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 4 data direction 7 to 0
These bits select input or output for port 4 pins

- Modes 1 to 6 (Expanded Modes)

  When all areas are designated as 8-bit-access areas, selecting 8-bit bus mode, port 4 functions as a generic input/output port. A pin in port 4 becomes an output port if the corresponding P4DDR bit is set to 1, and an input port if this bit is cleared to 0.

  When at least one area is designated as a 16-bit-access area, selecting 16-bit bus mode, port 4 functions as part of the data bus.
- Mode 7 (Single-Chip Mode)

  Port 4 functions as an input/output port. A pin in port 4 becomes an output port if the corresponding P4DDR bit is set to 1, and an input port if this bit is cleared to 0.

P4DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P4DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

ABWCR and P4DDR are not initialized in software standby mode. When port 4 functions as a generic input/output port, if a P4DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 4 Data Register (P4DR)

P4DR is an 8-bit readable/writable register that stores output data for pins $P4_7$ to $P4_0$. When a bit in P4DDR is set to 1, if port 4 is read the value of the corresponding P4DR bit is returned. When a bit in P4DDR is cleared to 0, if port 4 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	$P4_7$	$P4_6$	$P4_5$	$P4_4$	$P4_3$	$P4_2$	$P4_1$	$P4_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 4 data 7 to 0
These bits store data for port 4 pins

P4DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 4 Input Pull-Up MOS Control Register (P4PCR)

P4PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 4.

Bit	7	6	5	4	3	2	1	0
	$P4_7$PCR	$P4_6$PCR	$P4_5$PCR	$P4_4$PCR	$P4_3$PCR	$P4_2$PCR	$P4_1$PCR	$P4_0$PCR
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 4 input pull-up MOS control 7 to 0
These bits control input pull-up MOS transistors built into port 4

In mode 7 (single-chip mode), and in 8-bit bus mode in modes 1 to 6 (expanded modes), when a P4DDR bit is cleared to 0 (selecting generic input), if the corresponding P4PCR bit is set to 1, the input pull-up MOS transistor is turned on.

P4PCR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.7 summarizes the states of the input pull-ups MOS in the 8-bit and 16-bit bus modes.

Table 9.7 Input Pull-Up MOS Transistor States (Port 4)

Mode		Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1 to 6	8-bit bus mode	Off	Off	On/off	On/off
	16-bit bus mode			Off	Off
7				On/off	On/off

Legend:

Off: The input pull-up MOS transistor is always off.

On/off: The input pull-up MOS transistor is on if P4PCR = 1 and P4DDR = 0. Otherwise, it is off.

9.6 Port 5

9.6.1 Overview

Port 5 is a 4-bit input/output port with the pin configuration shown in figure 9.5. The pin functions differ depending on the operating mode.

In modes 1 to 4 (expanded modes with on-chip ROM disabled), port 5 consists of address output pins (A_{19} to A_{16}). In modes 5 and 6 (expanded modes with on-chip ROM enabled), settings in the port 5 data direction register (P5DDR) designate pins for address bus output (A_{19} to A_{16}) or generic input. In mode 7 (single-chip mode), port 5 is a generic input/output port.

Port 5 has software-programmable built-in pull-up MOS transistors.

Pins in port 5 can drive one TTL load and a 90-pF capacitive load. They can also drive an LED or a darlington transistor pair.

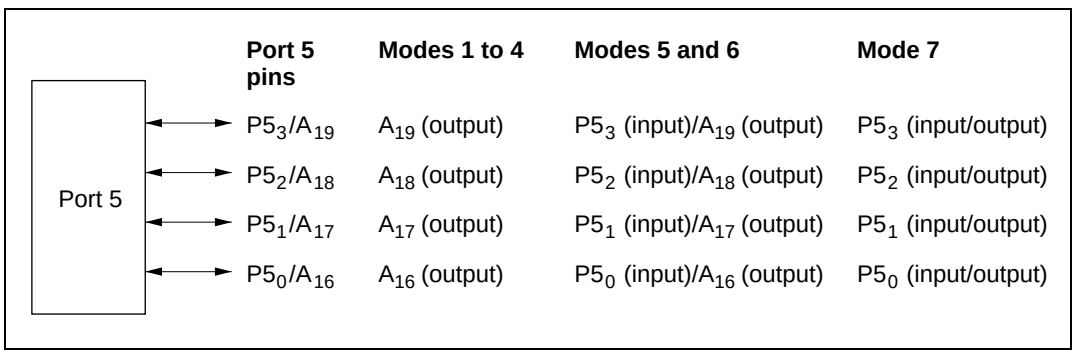

Figure 9.5 Port 5 Pin Configuration

9.6.2 Register Configuration

Table 9.8 summarizes the registers of port 5.

Table 9.8 Port 5 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Modes 1 to 4	Modes 5 to 7
H'FFC8	Port 5 data direction register	P5DDR	W	H'FF	H'F0
H'FFCA	Port 5 data register	P5DR	R/W	H'F0	H'F0
H'FFDB	Port 5 input pull-up MOS control register	P5PCR	R/W	H'F0	H'F0

Note: * Lower 16 bits of the address.

Port 5 Data Direction Register (P5DDR)

P5DDR is an 8-bit write-only register that can select input or output for each pin in port 5.

Bit		7	6	5	4	3	2	1	0
		—	—	—	—	$P5_3DDR$	$P5_2DDR$	$P5_1DDR$	$P5_0DDR$
Modes 1 to 4	Initial value	1	1	1	1	1	1	1	1
	Read/Write	—	—	—	—	—	—	—	—
Modes 5 to 7	Initial value	1	1	1	1	0	0	0	0
	Read/Write	—	—	—	—	W	W	W	W

Reserved bits

Port 5 data direction 3 to 0
These bits select input or output for port 5 pins

- Modes 1 to 4 (Expanded Modes with On-Chip ROM Disabled)

  P5DDR values are fixed at 1 and cannot be modified. Port 5 functions as an address bus. The reserved bits ($P5_7DDR$ to $P5_4DDR$) are also fixed at 1.
- Modes 5 and 6 (Expanded Modes with On-Chip ROM Enabled)

  Following a reset, port 5 is an input port. A pin in port 5 becomes an address output pin if the corresponding P5DDR bit is set to 1, and an input port if this bit is cleared to 0.
- Mode 7 (Single-Chip Mode)

  Port 5 functions as an input/output port. A pin in port 5 becomes an output port if the corresponding P5DDR bit is set to 1, and an input port if this bit is cleared to 0.

P5DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P5DDR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting, so if a P5DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 5 Data Register (P5DR)

P5DR is an 8-bit readable/writable register that stores output data for pins $P5_3$ to $P5_0$. When a bit in P5DDR is set to 1, if port 5 is read the value of the corresponding P5DR bit is returned. When a bit in P5DDR is cleared to 0, if port 5 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3$	$P5_2$	$P5_1$	$P5_0$
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Port 5 data 3 to 0
These bits store data for port 5 pins

Bits 7 to 4 are reserved. They cannot be modified and are always read as 1.

P5DR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 5 Input Pull-Up MOS Control Register (P5PCR)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3$PCR	$P5_2$PCR	$P5_1$PCR	$P5_0$PCR
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Port 5 input pull-up MOS control 3 to 0
These bits control input pull-up MOS transistors built into port 5

P5PCR is an 8-bit readable/writable register that controls the MOS input pull-up MOS transistors in port 5.

In modes 5 to 7, when a P5DDR bit is cleared (selecting the input port function), if the corresponding bit in P5PCR is set up 1, the input pull-up MOS transistor is turned on.

P5PCR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.9 summarizes the states of the input pull-ups MOS in each mode.

Table 9.9 Input Pull-Up MOS Transistor States (Port 5)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1	Off	Off	Off	Off
2				
3				
4				
5	Off	Off	On/off	On/off
6				
7				

Legend:

Off: The input pull-up MOS transistor is always off.

On/off: The input pull-up MOS transistor is on if P5PCR = 1 and P5DDR = 0. Otherwise, it is off.

9.7 Port 6

9.7.1 Overview

Port 6 is a 7-bit input/output port that is also used for input and output of bus control signals ($\overline{\text{LWR}}$, $\overline{\text{HWR}}$, $\overline{\text{RD}}$, $\overline{\text{AS}}$, $\overline{\text{BACK}}$, $\overline{\text{BREQ}}$, and $\overline{\text{WAIT}}$). When DRAM is connected to area 3, $\overline{\text{LWR}}$, $\overline{\text{HWR}}$, and $\overline{\text{RD}}$ also function as $\overline{\text{LW}}$, $\overline{\text{UW}}$, and $\overline{\text{CAS}}$, or $\overline{\text{LCAS}}$, $\overline{\text{UCAS}}$, and $\overline{\text{WE}}$, respectively. For details see section 7, Refresh Controller.

Figure 9.6 shows the pin configuration of port 6. In modes 1 to 6 (expanded modes) the pin functions are $\overline{\text{LWR}}$, $\overline{\text{HWR}}$, $\overline{\text{RD}}$, $\overline{\text{AS}}$, $P6_2/\overline{\text{BACK}}$, $P6_1/\overline{\text{BREQ}}$, and $P6_0/\overline{\text{WAIT}}$. See table 9.11 for the method of selecting the pin states. In mode 7 (single-chip mode) port 6 is a generic input/output port.

Pins in port 6 can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair.

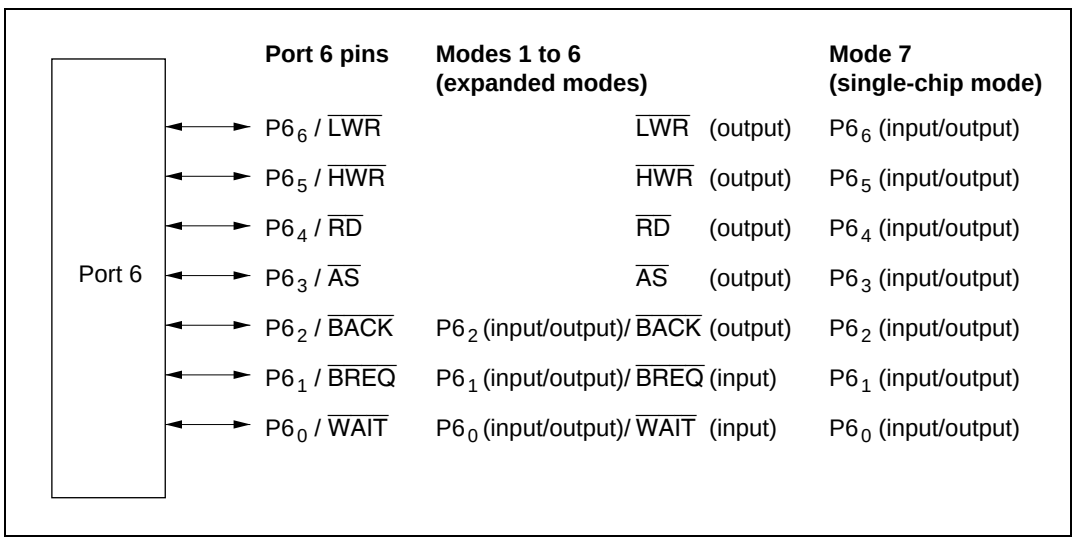

Figure 9.6 Port 6 Pin Configuration

9.7.2 Register Configuration

Table 9.10 summarizes the registers of port 6.

Table 9.10 Port 6 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Mode 1 to 5	Mode 6, 7
H'FFC9	Port 6 data direction register	P6DDR	W	H'F8	H'80
H'FFCB	Port 6 data register	P6DR	R/W	H'80	H'80

Note: * Lower 16 bits of the address.

Port 6 Data Direction Register (P6DDR)

P6DDR is an 8-bit write-only register that can select input or output for each pin in port 6.

Bit	7	6	5	4	3	2	1	0
	—	$P6_6DDR$	$P6_5DDR$	$P6_4DDR$	$P6_3DDR$	$P6_2DDR$	$P6_1DDR$	$P6_0DDR$
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	W	W	W	W	W	W	W

Reserved bit

Port 6 data direction 6 to 0
These bits select input or output for port 6 pins

- Modes 1 to 6 (Expanded Modes)
  $P6_6$ to $P6_3$ function as bus control output pins ($\overline{LWR}$, $\overline{HWR}$, $\overline{RD}$, $\overline{AS}$). $P6_2$ to $P6_0$ are generic input/output pins, functioning as output port when bits $P6_2DDR$ to $P6_0DDR$ are set to 1 and input port when these bits are cleared to 0.
- Mode 7 (Single-Chip Mode)
  Port 6 is a generic input/output port. A pin in port 6 becomes an output port if the corresponding P6DDR bit is set to 1, and an input port if this bit is cleared to 0.

Bit 7 is reserved.

P6DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P6DDR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P6DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 6 Data Register (P6DR)

P6DR is an 8-bit readable/writable register that stores output data for pins $P6_6$ to $P6_0$. When this register is read, the pin logic level is read for a bit with the corresponding P6DDR bit cleared to 0, and the P6DR value is read for a bit with the corresponding P6DDR bit set to 1.

Bit	7	6	5	4	3	2	1	0
	—	$P6_6$	$P6_5$	$P6_4$	$P6_3$	$P6_2$	$P6_1$	$P6_0$
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit

Port 6 data 6 to 0
These bits store data for port 6 pins

Bit 7 is reserved, cannot be modified, and always read as 1.

P6DR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.11 Port 6 Pin Functions in Modes 1 to 6

Pin	Pin Functions and Selection Method		
$P6_6$/$\overline{LWR}$	Functions as follows regardless of $P6_6$DDR		
	$P6_6$DDR	0	1
	Pin function	$\overline{LWR}$ output	
$P6_5$/$\overline{HWR}$	Functions as follows regardless of $P6_5$DDR		
	$P6_5$DDR	0	1
	Pin function	$\overline{HWR}$ output	
$P6_4$/$\overline{RD}$	Functions as follows regardless of $P6_4$DDR		
	$P6_4$DDR	0	1
	Pin function	$\overline{RD}$ output	

Pin	Pin Functions and Selection Method

$P6_3/\overline{AS}$

Functions as follows regardless of $P6_3DDR$

$P6_3DDR$	0	1
Pin function	$\overline{AS}$ output	

$P6_2/\overline{BACK}$

Bit BRLE in BRCR and bit $P6_2DDR$ select the pin function as follows

BRLE	0		1
$P6_2DDR$	0	1	—
Pin function	$P6_2$ input	$P6_2$ output	$\overline{BACK}$ output

$P6_1/\overline{BREQ}$

Bit BRLE in BRCR and bit $P6_1DDR$ select the pin function as follows

BRLE	0		1
$P6_1DDR$	0	1	—
Pin function	$P6_1$ input	$P6_1$ output	$\overline{BREQ}$ input

$P6_0/\overline{WAIT}$

Bits WCE7 to WCE0 in WCER, bit WMS1 in WCR, and bit $P6_0DDR$ select the pin function as follows

WCER	All 1s			Not all 1s
WMS1	0		1	—
$P6_0DDR$	0	1	0*	0*
Pin function	$P6_0$ input	$P6_0$ output	$\overline{WAIT}$ input	

Note: * Do not set bit $P6_0DDR$ to 1.

9.8 Port 7

9.8.1 Overview

Port 7 is an 8-bit input port that is also used for analog input to the A/D converter and analog output from the D/A converter. The pin functions are the same in all operating modes. Figure 9.7 shows the pin configuration of port 7.

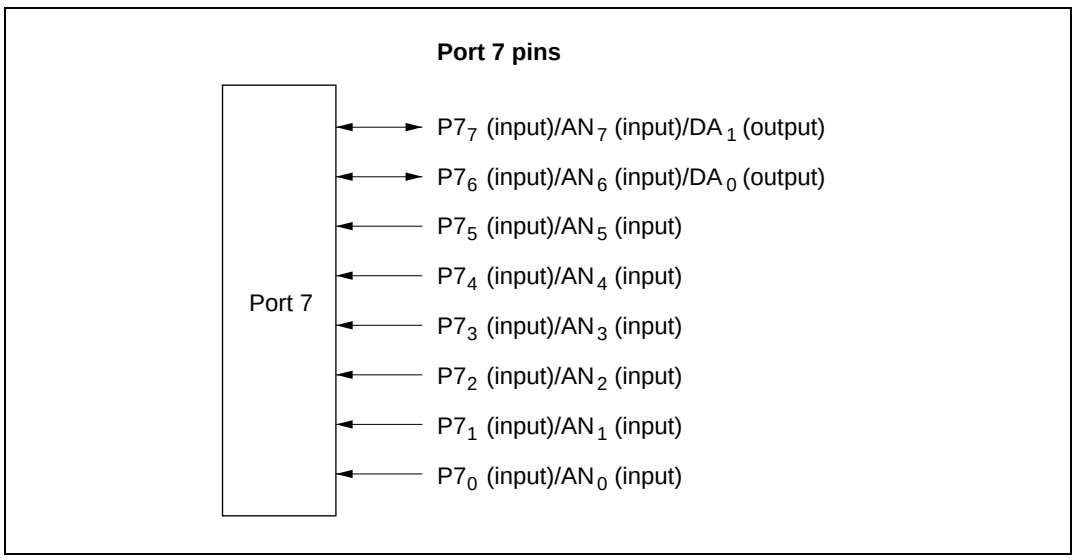

Figure 9.7 Port 7 Pin Configuration

9.8.2 Register Configuration

Table 9.12 summarizes the port 7 register. Port 7 is an input-only port, so it has no data direction register.

Table 9.12 Port 7 Data Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFCE	Port 7 data register	P7DR	R	Undetermined

Note: * Lower 16 bits of the address.

Port 7 Data Register (P7DR)

Bit	7	6	5	4	3	2	1	0
	$P7_7$	$P7_6$	$P7_5$	$P7_4$	$P7_3$	$P7_2$	$P7_1$	$P7_0$
Initial value	—*	—*	—*	—*	—*	—*	—*	—*
Read/Write	R	R	R	R	R	R	R	R

Note: * Determined by pins $P7_7$ to $P7_0$.

When port 7 is read, the pin levels are always read.

9.9 Port 8

9.9.1 Overview

Port 8 is a 5-bit input/output port that is also used for $\overline{CS}_3$ to $\overline{CS}_0$ output, $\overline{RFSH}$ output, and $\overline{IRQ}_3$ to $\overline{IRQ}_0$ input. Figure 9.8 shows the pin configuration of port 8.

In modes 1 to 6 (expanded modes), port 8 can provide $\overline{CS}_3$ to $\overline{CS}_0$ output, RFSH output, and $\overline{IRQ}_3$ to $\overline{IRQ}_0$ input. See table 9.14 for the selection of pin functions in expanded modes.

In mode 7 (single-chip mode), port 8 can provide $\overline{IRQ}_3$ to $\overline{IRQ}_0$ input. See table 9.15 for the selection of pin functions in single-chip mode.

The $\overline{IRQ}_3$ to $\overline{IRQ}_0$ functions are selected by IER settings, regardless of whether the pin is used for input or output. For details see section 5, Interrupt Controller.

Pins in port 8 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

Pins $P8_2$ to $P8_0$ have Schmitt-trigger inputs.

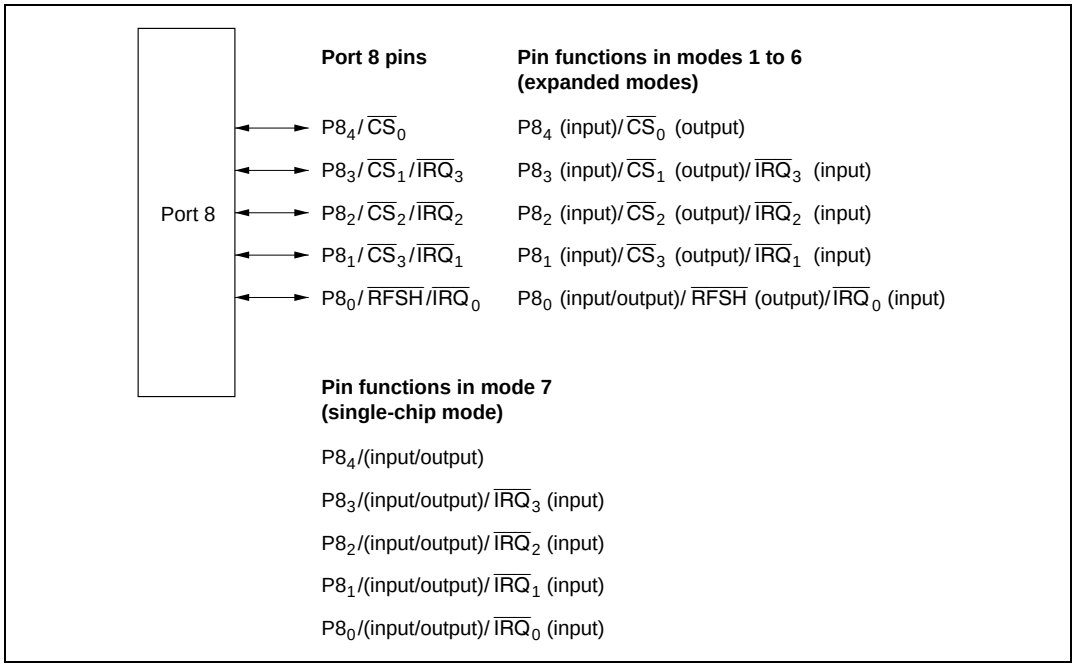

Figure 9.8 Port 8 Pin Configuration

9.9.2 Register Configuration

Table 9.13 summarizes the registers of port 8.

Table 9.13 Port 8 Registers

Address*	Name	Abbreviation	R/W	Initial Value	
				Mode 1 to 4	Mode 5 to 7
H'FFCD	Port 8 data direction register	P8DDR	W	H'F0	H'E0
H'FFCF	Port 8 data register	P8DR	R/W	H'E0	H'E0

Note: * Lower 16 bits of the address.

Port 8 Data Direction Register (P8DDR)

P8DDR is an 8-bit write-only register that can select input or output for each pin in port 8.

Bit		7	6	5	4	3	2	1	0
		—	—	—	$P8_4DDR$	$P8_3DDR$	$P8_2DDR$	$P8_1DDR$	$P8_0DDR$
Modes 1 to 4	Initial value	1	1	1	1	0	0	0	0
	Read/Write	—	—	—	W	W	W	W	W
Modes 5 to 7	Initial value	1	1	1	0	0	0	0	0
	Read/Write	—	—	—	W	W	W	W	W

Reserved bits

Port 8 data direction 4 to 0
These bits select input or output for port 8 pins

- Modes 1 to 6 (Expanded Modes)

  When bits in P8DDR bit are set to 1, $P8_4$ to $P8_1$ become $\overline{CS}_0$ to $\overline{CS}_3$ output pins. When bits in P8DDR are cleared to 0, the corresponding pins become input ports. In modes 1 to 4 (expanded modes with on-chip ROM disabled), following a reset only $\overline{CS}_0$ is output. The other three pins are input ports. In modes 5 and 6 (expanded modes with on-chip ROM enabled), following a reset all four pins are input ports.

  When the refresh controller is enabled, $P8_0$ is used unconditionally for $\overline{RFSH}$ output. When the refresh controller is disabled, $P8_0$ becomes a generic input/output port according to the P8DDR setting. For details see table 9.15.

- Mode 7 (Single-Chip Mode)

  Port 8 is a generic input/output port. A pin in port 8 becomes an output port if the corresponding P8DDR bit is set to 1, and an input port if this bit is cleared to 0.

P8DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P8DDR is initialized to H'E0 or H'F0 by a reset and in hardware standby mode. The reset value depends on the operating mode. In software standby mode P8DDR retains its previous setting. If a P8DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 8 Data Register (P8DR)

P8DR is an 8-bit readable/writable register that stores output data for pins $P8_4$ to $P8_0$. When a bit in P8DDR is set to 1, if port 8 is read the value of the corresponding P8DR bit is returned. When a bit in P8DDR is cleared to 0, if port 8 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	—	—	—	$P8_4$	$P8_3$	$P8_2$	$P8_1$	$P8_0$
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits

Port 8 data 4 to 0
These bits store data for port 8 pins

Bits 7 to 5 are reserved. They cannot be modified and always are read as 1.

P8DR is initialized to H'E0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.14 Port 8 Pin Functions in Modes 1 to 6

Pin	Pin Functions and Selection Method		
$P8_4/\overline{CS_0}$	Bit $P8_4DDR$ selects the pin function as follows		
	$P8_4DDR$	0	1
	Pin function	$P8_4$ input	$\overline{CS_0}$ output
$P8_3/\overline{CS_1}/\overline{IRQ_3}$	Bit $P8_3DDR$ selects the pin function as follows		
	$P8_3DDR$	0	1
	Pin function	$P8_3$ input	$\overline{CS_1}$ output
		$\overline{IRQ_3}$ input	
$P8_2/\overline{CS_2}/\overline{IRQ_2}$	Bit $P8_2DDR$ selects the pin function as follows		
	$P8_2DDR$	0	1
	Pin function	$P8_2$ input	$\overline{CS_2}$ output
		$\overline{IRQ_2}$ input	
$P8_1/\overline{CS_3}/\overline{IRQ_1}$	Bit $P8_1DDR$ selects the pin function as follows		
	$P8_1DDR$	0	1
	Pin function	$P8_1$ input	$\overline{CS_3}$ output
		$\overline{IRQ_1}$ input	
$P8_0/\overline{RFSH}/\overline{IRQ_0}$	Bit RFSHE in RFSHCR and bit $P8_0DDR$ select the pin function as follows		
	RFSHE	0	1
	$P8_0DDR$	0	1	—
	Pin function	$P8_0$ input	$P8_0$ output	$\overline{RFSH}$ output
		$\overline{IRQ_0}$ input		

Table 9.15 Port 8 Pin Functions in Mode 7

Pin	Pin Functions and Selection Method		
$P8_4$	Bit $P8_4$DDR selects the pin function as follows		
	$P8_4$DDR	0	1
	Pin function	$P8_4$ input	$P8_4$ output
$P8_3/\overline{IRQ}_3$	Bit $P8_3$DDR selects the pin function as follows		
	$P8_3$DDR	0	1
	Pin function	$P8_3$ input	$P8_3$ output
		$\overline{IRQ}_3$ input	
$P8_2/\overline{IRQ}_2$	Bit $P8_2$DDR selects the pin function as follows		
	$P8_2$DDR	0	1
	Pin function	$P8_2$ input	$P8_2$ output
		$\overline{IRQ}_2$ input	
$P8_1/\overline{IRQ}_1$	Bit $P8_1$DDR selects the pin function as follows		
	$P8_1$DDR	0	1
	Pin function	$P8_1$ input	$P8_1$ output
		$\overline{IRQ}_1$ input	
$P8_0/\overline{IRQ}_0$	Bit $P8_0$DDR select the pin function as follows		
	$P8_0$DDR	0	1
	Pin function	$P8_0$ input	$P8_0$ output
		$\overline{IRQ}_0$ input	

9.10 Port 9

9.10.1 Overview

Port 9 is a 6-bit input/output port that is also used for input and output (TxD_0, TxD_1, RxD_0, RxD_1, SCK_0, SCK_1) by serial communication interface channels 0 and 1 (SCI0 and SCI1), and for $\overline{IRQ}_5$ and $\overline{IRQ}_4$ input. See table 9.17 for the selection of pin functions.

The $\overline{IRQ}_5$ and $\overline{IRQ}_4$ functions are selected by IER settings, regardless of whether the pin is used for input or output. For details see section 5, Interrupt Controller.

Port 9 has the same set of pin functions in all operating modes. Figure 9.9 shows the pin configuration of port 9.

Pins in port 9 can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair.

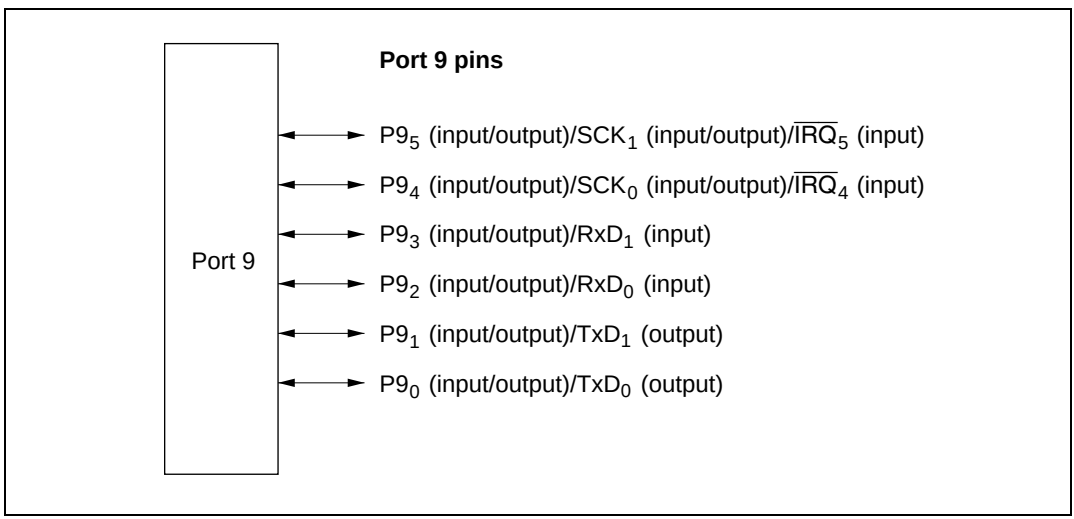

Figure 9.9 Port 9 Pin Configuration

9.10.2 Register Configuration

Table 9.16 summarizes the registers of port 9.

Table 9.16 Port 9 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFD0	Port 9 data direction register	P9DDR	W	H'C0
H'FFD2	Port 9 data register	P9DR	R/W	H'C0

Note: * Lower 16 bits of the address.

Port 9 Data Direction Register (P9DDR)

P9DDR is an 8-bit write-only register that can select input or output for each pin in port 9.

Bit	7	6	5	4	3	2	1	0
	—	—	$P9_5DDR$	$P9_4DDR$	$P9_3DDR$	$P9_2DDR$	$P9_1DDR$	$P9_0DDR$
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	W	W	W	W	W	W

Reserved bits

Port 9 data direction 5 to 0
These bits select input or output for port 9 pins

A pin in port 9 becomes an output port if the corresponding P9DDR bit is set to 1, and an input port if this bit is cleared to 0.

P9DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P9DDR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P9DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 9 Data Register (P9DR)

P9DR is an 8-bit readable/writable register that stores output data for pins $P9_5$ to $P9_0$. When a bit in P9DDR is set to 1, if port 9 is read the value of the corresponding P9DR bit is returned. When a bit in P9DDR is cleared to 0, if port 9 is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	—	—	$P9_5$	$P9_4$	$P9_3$	$P9_2$	$P9_1$	$P9_0$
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Port 9 data 5 to 0
These bits store data for port 9 pins

Bits 7 and 6 are reserved. They cannot be modified and are always read as 1.

P9DR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Table 9.17 Port 9 Pin Functions

Pin	Pin Functions and Selection Method

$P9_5/SCK_1/\overline{IRQ}_5$ Bit C/$\overline{A}$ in SMR of SCI1, bits CKE0 and CKE1 in SCR of SCI1, and bit $P9_5$DDR select the pin function as follows

CKE1	0				1
C/$\overline{A}$	0			1	—
CKE0	0		1	—	—
$P9_5$DDR	0	1	—	—	—
Pin function	$P9_5$ input	$P9_5$ output	SCK_1 output	SCK_1 output	SCK_1 input
	$\overline{IRQ}_5$ input				

$P9_4/SCK_0/\overline{IRQ}_4$ Bit C/$\overline{A}$ in SMR of SCI0, bits CKE0 and CKE1 in SCR of SCI0, and bit $P9_4$DDR select the pin function as follows

CKE1	0				1
C/$\overline{A}$	0			1	—
CKE0	0		1	—	—
$P9_4$DDR	0	1	—	—	—
Pin function	$P9_4$ input	$P9_4$ output	SCK_0 output	SCK_0 output	SCK_0 input
	$\overline{IRQ}_4$ input				

$P9_3/RxD_1$ Bit RE in SCR of SCI1 and bit $P9_3$DDR select the pin function as follows

RE	0		1
$P9_3$DDR	0	1	—
Pin function	$P9_3$ input	$P9_3$ output	RxD_1 input

$P9_2/RxD_0$ Bit RE in SCR of SCI0, bit SMIF in SCMR, and bit $P9_2$DDR select the pin function as follows

SMIF	0			1
RE	0		1	—
$P9_2$DDR	0	1	—	—
Pin function	$P9_2$ input	$P9_2$ output	RxD_0 input	RxD_0 input

Pin	Pin Functions and Selection Method
$P9_1$/TxD_1	Bit TE in SCR of SCI1 and bit $P9_1$DDR select the pin function as follows

TE	0		1
$P9_1$DDR	0	1	—
Pin function	$P9_1$ input	$P9_1$ output	TxD_1 output

$P9_0$/TxD_0 Bit TE in SCR of SCI0, bit SMIF in SCMR, and bit $P9_0$DDR select the pin function as follows

SMIF	0			1
TE	0		1	—
$P9_0$DDR	0	1	—	—
Pin function	$P9_0$ input	$P9_0$ output	TxD_0 output	TxD_0 output*

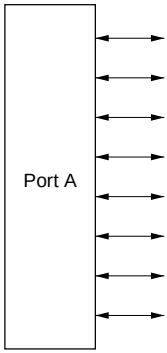
Note: * Functions as the TxD_0 output pin, but there are two states: one in which the pin is driven, and another in which the pin is at high-impedance.

9.11 Port A

9.11.1 Overview

Port A is an 8-bit input/output port that is also used for output (TP_7 to TP_0) from the programmable timing pattern controller (TPC), input and output ($TIOCB_2$, $TIOCA_2$, $TIOCB_1$, $TIOCA_1$, $TIOCB_0$, $TIOCA_0$, TCLKD, TCLKC, TCLKB, TCLKA) by the 16-bit integrated timer unit (ITU), output ($\overline{TEND}_1$, $\overline{TEND}_0$) from the DMA controller (DMAC), $\overline{CS}_4$ to $\overline{CS}_6$ output, and address output (A_{23} to A_{20}). A reset or hardware standby leaves port A as an input port, except that in modes 3, 4, and 6, one pin is always used for A_{20} output. Usage of pins for TPC, ITU, and DMAC input and output is described in the sections on those modules. For output of address bits A_{23} to A_{21} in modes 3, 4, and 6, see section 6.2.5, Bus Release Control Register (BRCR). For output of $\overline{CS}_4$ to $\overline{CS}_6$ in modes 1 to 6, see section 6.3.2, Chip Select Signals. Pins not assigned to any of these functions are available for generic input/output. Figure 9.10 shows the pin configuration of port A.

Pins in port A can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair. Port A has Schmitt-trigger inputs.



Port A pins

$PA_7/TP_7/TIOCB_2/A_{20}$
$PA_6/TP_6/TIOCA_2/A_{21}/\overline{CS}_4$
$PA_5/TP_5/TIOCB_1/A_{22}/\overline{CS}_5$
$PA_4/TP_4/TIOCA_1/A_{23}/\overline{CS}_6$
$PA_3/TP_3/TIOCB_0/TCLKD$
$PA_2/TP_2/TIOCA_0/TCLKC$
$PA_1/TP_1/\overline{TEND}_1/TCLKB$
$PA_0/TP_0/\overline{TEND}_0/TCLKA$

Pin functions in modes 1, 2, and 5

PA_7 (input/output)/TP_7 (output)/$TIOCB_2$ (input/output)

Figure 9.10 Port A Pin Configuration

9.11.2 Register Configuration

Table 9.18 summarizes the registers of port A.

Table 9.18 Port A Registers

Address*	Name	Abbreviation	R/W	Initial Value: Modes 1, 2, 5 and 7	Initial Value: Modes 3, 4, and 6
H'FFD1	Port A data direction register	PADDR	W	H'00	H'80
H'FFD3	Port A data register	PADR	R/W	H'00	H'00

Note: * Lower 16 bits of the address.

Port A Data Direction Register (PADDR)

PADDR is an 8-bit write-only register that can select input or output for each pin in port A. When pins are used for TPC output, the corresponding PADDR bits must also be set.

Bit		7	6	5	4	3	2	1	0
		PA_7DDR	PA_6DDR	PA_5DDR	PA_4DDR	PA_3DDR	PA_2DDR	PA_1DDR	PA_0DDR
Modes 3, 4, and 6	Initial value	1	0	0	0	0	0	0	0
	Read/Write	—	W	W	W	W	W	W	W
Modes 1, 2, 5, and 7	Initial value	0	0	0	0	0	0	0	0
	Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0
These bits select input or output for port A pins

A pin in port A becomes an output pin if the corresponding PADDR bit is set to 1, and an input pin if this bit is cleared to 0. In modes 3, 4, and 6, PA_7DDR is fixed at 1 and PA_7 functions as an address output pin.

PADDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PADDR is initialized to H'00 by a reset and in hardware standby mode in modes 1, 2, 5, and 7.

It is initialized to H'80 by a reset and in hardware standby mode in modes 3, 4, and 6. In software standby mode it retains its previous setting. If a PADDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port A Data Register (PADR)

PADR is an 8-bit readable/writable register that stores output data for pins PA_7 to PA_0. When a bit in PADDR is set to 1, if port A is read the value of the corresponding PADR bit is returned. When a bit in PADDR is cleared to 0, if port A is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	PA_7	PA_6	PA_5	PA_4	PA_3	PA_2	PA_1	PA_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port A data 7 to 0
These bits store data for port A pins

PADR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

9.11.3 Pin Functions

Table 9.19 describes the selection of pin functions.

Table 9.19 Port A Pin Functions

Pin	Pin Functions and Selection Method
$PA_7/TP_7/TIOCB_2/A_{20}$	The mode setting, ITU channel 2 settings (bit PWM2 in TMDR and bits IOB2 to IOB0 in TIOR2), bit NDER7 in NDERA, and bit PA_7DDR in PADDR select the pin function as follows

Mode	1, 2, 5, 7				3, 4, 6

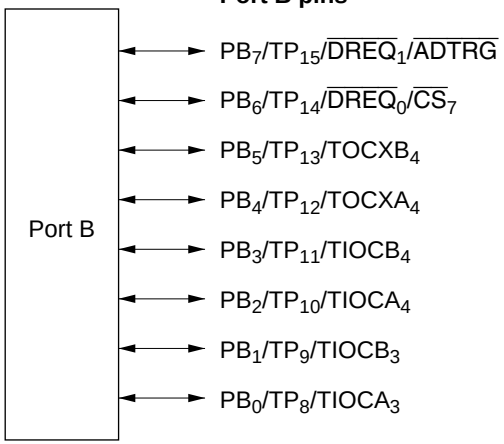
9.12 Port B

9.12.1 Overview

Port B is an 8-bit input/output port that is also used for output (TP_{15} to TP_8) from the programmable timing pattern controller (TPC), input/output ($TIOCB_4$, $TIOCB_3$, $TIOCA_4$, $TIOCA_3$) and output ($TOCXB_4$, $TOCXA_4$) by the 16-bit integrated timer unit (ITU), input ($\overline{DREQ}_1$, $\overline{DREQ}_0$) to the DMA controller (DMAC), $\overline{ADTRG}$ input to the A/D converter, and $\overline{CS}_7$ output. A reset or hardware standby leaves port B as an input port. Usage of pins for TPC, ITU, DMAC, and A/D converter input and output is described in the sections on those modules. For output of $\overline{CS}_7$ in modes 1 to 6, see section 6.3.2, Chip Select Signals. Pins not assigned to any of these functions are available for generic input/output. Figure 9.11 shows the pin configuration of port B.

Pins in port B can drive one TTL load and a 30-pF capacitive load. They can also drive an LED or darlington transistor pair. Pins PB_3 to PB_0 have Schmitt-trigger inputs.



Pin functions in modes 1 to 6

PB_7 (input/output)/TP_{15} (output)/$\overline{DREQ}_1$ (input)/$\overline{ADTRG}$ (input)
PB_6 (input/output)/TP_{14} (output)/$\overline{DREQ}_0$ (input)/$\overline{CS}_7$ (output)
PB_5 (input/output)/TP_{13} (output)/$TOCXB_4$ (output)
PB_4 (input/output)/TP_{12} (output)/$TOCXA_4$ (output)
PB_3 (input/output)/TP_{11} (output)/$TIOCB_4$ (input/output)
PB_2 (input/output)/TP_{10} (output)/$TIOCA_4$ (input/output)
PB_1 (input/output)/TP_9 (output)/$TIOCB_3$ (input/output)
PB_0 (input/output)/TP_8 (output)/$TIOCA_3$ (input/output)

Pin functions in mode 7

PB_6 (input/output)/TP_{14} (output)/$\overline{DREQ}_0$ (input)
PB_5 (input/output)/TP_{13} (output)/$TOCXB_4$ (output)
PB_4 (input/output)/TP_{12} (output)/$TOCXA_4$ (output)
PB_3 (input/output)/TP_{11} (output)/$TIOCB_4$ (input/output)
PB_2 (input/output)/TP_{10} (output)/$TIOCA_4$ (input/output)
PB_1 (input/output)/TP_9 (output)/$TIOCB_3$ (input/output)
PB_0 (input/output)/TP_8 (output)/$TIOCA_3$ (input/output)

Figure 9.11 Port B Pin Configuration

9.12.2 Register Configuration

Table 9.20 summarizes the registers of port B.

Table 9.20 Port B Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFD4	Port B data direction register	PBDDR	W	H'00
H'FFD6	Port B data register	PBDR	R/W	H'00

Note: * Lower 16 bits of the address.

Port B Data Direction Register (PBDDR)

PBDDR is an 8-bit write-only register that can select input or output for each pin in port B. When pins are used for TPC output, the corresponding PBDDR bits must also be set.

Bit	7	6	5	4	3	2	1	0
	PB_7DDR	PB_6DDR	PB_5DDR	PB_4DDR	PB_3DDR	PB_2DDR	PB_1DDR	PB_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0
These bits select input or output for port B pins

A pin in port B becomes an output pin if the corresponding PBDDR bit is set to 1, and an input pin if this bit is cleared to 0.

PBDDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PBDDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a PBDDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port B Data Register (PBDR)

PBDR is an 8-bit readable/writable register that stores output data for pins PB7 to PB0. When a bit in PBDDR is set to 1, if port B is read the value of the corresponding PBDR bit is returned. When a bit in PBDDR is cleared to 0, if port B is read the corresponding pin level is read.

Bit	7	6	5	4	3	2	1	0
	PB_7	PB_6	PB_5	PB_4	PB_3	PB_2	PB_1	PB_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port B data 7 to 0
These bits store data for port B pins

PBDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

9.12.3 Pin Functions

Table 9.21 describes the selection of pin functions.

Table 9.21 Port B Pin Functions

Pin	Pin Functions and Selection Method
PB_7/TP_{15}/ $\overline{DREQ_1}$/ $\overline{ADTRG}$	DMAC channel 1 settings (bits DTS2/1/0A and DTS2/1/0B in DTCR1A and DTCR1B), bit TRGE in ADCR, bit NDER15 in NDERB, and bit PB_7DDR in PBDDR select the pin function as follows

PB_7DDR	0	1	1
NDER15	—	0	1
Pin function	PB_7 input	PB_7 output	TP_{15} output
	$\overline{DREQ_1}$ input*1		
	$\overline{ADTRG}$ input*2		

Notes: 1. $\overline{DREQ_1}$ input under DMAC channel 1 settings (1) in the table below.
2. $\overline{ADTRG}$ input when TRGE = 1.

Section 10 16-Bit Integrated Timer Unit (ITU)

10.1 Overview

The H8/3052BF has a built-in 16-bit integrated timer unit (ITU) with five 16-bit timer channels.

When the ITU is not used, it can be independently halted to conserve power. For details see section 20.6, Module Standby Function.

10.1.1 Features

ITU features are listed below.

- Capability to process up to 12 pulse outputs or 10 pulse inputs
- Ten general registers (GRs, two per channel) with independently-assignable output compare or input capture functions
- Selection of eight counter clock sources for each channel:
  Internal clocks: ϕ, $\phi/2$, $\phi/4$, $\phi/8$
  External clocks: TCLKA, TCLKB, TCLKC, TCLKD
- Five operating modes selectable in all channels:
  - Waveform output by compare match
    Selection of 0 output, 1 output, or toggle output (only 0 or 1 output in channel 2)
  - Input capture function
    Rising edge, falling edge, or both edges (selectable)
  - Counter clearing function
    Counters can be cleared by compare match or input capture
  - Synchronization
    Two or more timer counters (TCNTs) can be preset simultaneously, or cleared simultaneously by compare match or input capture. Counter synchronization enables synchronous register input and output.
  - PWM mode
    PWM output can be provided with an arbitrary duty cycle. With synchronization, up to five-phase PWM output is possible
- Phase counting mode selectable in channel 2
  Two-phase encoder output can be counted automatically.

- Three additional modes selectable in channels 3 and 4
  - — Reset-synchronized PWM mode

    If channels 3 and 4 are combined, three-phase PWM output is possible with three pairs of complementary waveforms.
  - — Complementary PWM mode

    If channels 3 and 4 are combined, three-phase PWM output is possible with three pairs of non-overlapping complementary waveforms.
  - — Buffering

    Input capture registers can be double-buffered. Output compare registers can be updated automatically.
- High-speed access via internal 16-bit bus

  The 16-bit timer counters, general registers, and buffer registers can be accessed at high speed via a 16-bit bus.
- Fifteen interrupt sources

  Each channel has two compare match/input capture interrupts and an overflow interrupt. All interrupts can be requested independently.
- Activation of DMA controller (DMAC)

  Four of the compare match/input capture interrupts from channels 0 to 3 can start the DMAC.
- Output triggering of programmable timing pattern controller (TPC)

  Compare match/input capture signals from channels 0 to 3 can be used as TPC output triggers.

Table 10.1 summarizes the ITU functions.

Table 10.1 ITU Functions

Item		Channel 0	Channel 1	Channel 2	Channel 3	Channel 4

Notes: 1. The lower 16 bits of the address are indicated.
2. Only 0 can be written, to clear flags.

10.2 Register Descriptions

10.2.1 Timer Start Register (TSTR)

TSTR is an 8-bit readable/writable register that starts and stops the timer counter (TCNT) in channels 0 to 4.

Bit	7	6	5	4	3	2	1	0
	—	—	—	STR4	STR3	STR2	STR1	STR0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits

Counter start 4 to 0
These bits start and stop TCNT4 to TCNT0

TSTR is initialized to H'E0 by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—Counter Start 4 (STR4): Starts and stops timer counter 4 (TCNT4).

Bit 4: STR4	Description	
0	TCNT4 is halted	(Initial value)
1	TCNT4 is counting	

Bit 3—Counter Start 3 (STR3): Starts and stops timer counter 3 (TCNT3).

Bit 3: STR3	Description	
0	TCNT3 is halted	(Initial value)
1	TCNT3 is counting	

Bit 2—Counter Start 2 (STR2): Starts and stops timer counter 2 (TCNT2).

Bit 2: STR2	Description	
0	TCNT2 is halted	(Initial value)
1	TCNT2 is counting	

Bit 1—Counter Start 1 (STR1): Starts and stops timer counter 1 (TCNT1).

Bit 1: STR1	Description	
0	TCNT1 is halted	(Initial value)
1	TCNT1 is counting	

Bit 0—Counter Start 0 (STR0): Starts and stops timer counter 0 (TCNT0).

Bit 0: STR0	Description	
0	TCNT0 is halted	(Initial value)
1	TCNT0 is counting	

10.2.2 Timer Synchro Register (TSNC)

TSNC is an 8-bit readable/writable register that selects whether channels 0 to 4 operate independently or synchronously. Channels are synchronized by setting the corresponding bits to 1.

Bit	7	6	5	4	3	2	1	0
	—	—	—	SYNC4	SYNC3	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits

Timer sync 4 to 0
These bits synchronize channels 4 to 0

TSNC is initialized to H'E0 by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—Timer Sync 4 (SYNC4): Selects whether channel 4 operates independently or synchronously.

Bit 4: SYNC4	Description	
0	Channel 4's timer counter (TCNT4) operates independently TCNT4 is preset and cleared independently of other channels	(Initial value)
1	Channel 4 operates synchronously TCNT4 can be synchronously preset and cleared	

Bit 3—Timer Sync 3 (SYNC3): Selects whether channel 3 operates independently or synchronously.

Bit 3: SYNC3	Description	
0	Channel 3's timer counter (TCNT3) operates independently TCNT3 is preset and cleared independently of other channels	(Initial value)
1	Channel 3 operates synchronously TCNT3 can be synchronously preset and cleared	

Bit 2—Timer Sync 2 (SYNC2): Selects whether channel 2 operates independently or synchronously.

Bit 2: SYNC2	Description	
0	Channel 2's timer counter (TCNT2) operates independently TCNT2 is preset and cleared independently of other channels	(Initial value)
1	Channel 2 operates synchronously TCNT2 can be synchronously preset and cleared	

Bit 1—Timer Sync 1 (SYNC1): Selects whether channel 1 operates independently or synchronously.

Bit 1: SYNC1	Description	
0	Channel 1's timer counter (TCNT1) operates independently TCNT1 is preset and cleared independently of other channels	(Initial value)
1	Channel 1 operates synchronously TCNT1 can be synchronously preset and cleared	

Bit 0—Timer Sync 0 (SYNC0): Selects whether channel 0 operates independently or synchronously.

Bit 0: SYNC0	Description	
0	Channel 0's timer counter (TCNT0) operates independently TCNT0 is preset and cleared independently of other channels	(Initial value)
1	Channel 0 operates synchronously TCNT0 can be synchronously preset and cleared	

10.2.3 Timer Mode Register (TMDR)

TMDR is an 8-bit readable/writable register that selects PWM mode for channels 0 to 4. It also selects phase counting mode and the overflow flag (OVF) setting conditions for channel 2.

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	PWM4	PWM3	PWM2	PWM1	PWM0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

PWM mode 4 to 0
These bits select PWM mode for channels 4 to 0

Flag direction
Selects the setting condition for the overflow flag (OVF) in timer status register 2 (TSR2)

Phase counting mode flag
Selects phase counting mode for channel 2

Reserved bit

TMDR is initialized to H'80 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bit 6—Phase Counting Mode Flag (MDF): Selects whether channel 2 operates normally or in phase counting mode.

Bit 6: MDF	Description	
0	Channel 2 operates normally	(Initial value)
1	Channel 2 operates in phase counting mode	

When MDF is set to 1 to select phase counting mode, TCNT2 operates as an up/down-counter and pins TCLKA and TCLKB become counter clock input pins. TCNT2 counts both rising and falling edges of TCLKA and TCLKB, and counts up or down as follows.

Counting Direction	Down-Counting				Up-Counting			
TCLKA pin	↑	High	↓	Low	↑	Low	↓	High
TCLKB pin	Low	↑	High	↓	High	↑	Low	↓

In phase counting mode channel 2 operates as above regardless of the external clock edges selected by bits CKEG1 and CKEG0 and the clock source selected by bits TPSC2 to TPSC0 in TCR2. Phase counting mode takes precedence over these settings.

The counter clearing condition selected by the CCLR1 and CCLR0 bits in TCR2 and the compare match/input capture settings and interrupt functions of TIOR2, TIER2, and TSR2 remain effective in phase counting mode.

Bit 5—Flag Direction (FDIR): Designates the setting condition for the OVF flag in TSR2. The FDIR designation is valid in all modes in channel 2.

Bit 5: FDIR	Description	
0	OVF is set to 1 in TSR2 when TCNT2 overflows or underflows	(Initial value)
1	OVF is set to 1 in TSR2 when TCNT2 overflows	

Bit 4—PWM Mode 4 (PWM4): Selects whether channel 4 operates normally or in PWM mode.

Bit 4: PWM4	Description	
0	Channel 4 operates normally	(Initial value)
1	Channel 4 operates in PWM mode	

When bit PWM4 is set to 1 to select PWM mode, pin $TIOCA_4$ becomes a PWM output pin. The output goes to 1 at compare match with GRA4, and to 0 at compare match with GRB4.

If complementary PWM mode or reset-synchronized PWM mode is selected by bits CMD1 and CMD0 in TFCR, the CMD1 and CMD0 setting takes precedence and the PWM4 setting is ignored.

Bit 3—PWM Mode 3 (PWM3): Selects whether channel 3 operates normally or in PWM mode.

Bit 3: PWM3	Description	
0	Channel 3 operates normally	(Initial value)
1	Channel 3 operates in PWM mode	

When bit PWM3 is set to 1 to select PWM mode, pin $TIOCA_3$ becomes a PWM output pin. The output goes to 1 at compare match with GRA3, and to 0 at compare match with GRB3.

If complementary PWM mode or reset-synchronized PWM mode is selected by bits CMD1 and CMD0 in TFCR, the CMD1 and CMD0 setting takes precedence and the PWM3 setting is ignored.

Bit 2—PWM Mode 2 (PWM2): Selects whether channel 2 operates normally or in PWM mode.

Bit 2: PWM2	Description	
0	Channel 2 operates normally	(Initial value)
1	Channel 2 operates in PWM mode	

When bit PWM2 is set to 1 to select PWM mode, pin $TIOCA_2$ becomes a PWM output pin. The output goes to 1 at compare match with GRA2, and to 0 at compare match with GRB2.

Bit 1—PWM Mode 1 (PWM1): Selects whether channel 1 operates normally or in PWM mode.

Bit 1: PWM1	Description	
0	Channel 1 operates normally	(Initial value)
1	Channel 1 operates in PWM mode	

When bit PWM1 is set to 1 to select PWM mode, pin $TIOCA_1$ becomes a PWM output pin. The output goes to 1 at compare match with GRA1, and to 0 at compare match with GRB1.

Bit 0—PWM Mode 0 (PWM0): Selects whether channel 0 operates normally or in PWM mode.

Bit 0: PWM0	Description	
0	Channel 0 operates normally	(Initial value)
1	Channel 0 operates in PWM mode	

When bit PWM0 is set to 1 to select PWM mode, pin $TIOCA_0$ becomes a PWM output pin. The output goes to 1 at compare match with GRA0, and to 0 at compare match with GRB0.

10.2.4 Timer Function Control Register (TFCR)

TFCR is an 8-bit readable/writable register that selects complementary PWM mode, reset-synchronized PWM mode, and buffering for channels 3 and 4.

Bit	7	6	5	4	3	2	1	0
	—	—	CMD1	CMD0	BFB4	BFA4	BFB3	BFA3
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Combination mode 1/0
These bits select complementary PWM mode or reset-synchronized PWM mode for channels 3 and 4

Buffer mode B4 and A4
These bits select buffering of general registers (GRB4 and GRA4) by buffer registers (BRB4 and BRA4) in channel 4

Buffer mode B3 and A3
These bits select buffering of general registers (GRB3 and GRA3) by buffer registers (BRB3 and BRA3) in channel 3

TFCR is initialized to H'C0 by a reset and in standby mode.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bits 5 and 4—Combination Mode 1 and 0 (CMD1, CMD0): These bits select whether channels 3 and 4 operate in normal mode, complementary PWM mode, or reset-synchronized PWM mode.

Bit 5: CMD1	Bit 4: CMD0	Description
0	0	Channels 3 and 4 operate normally (Initial value)
	1	
1	0	Channels 3 and 4 operate together in complementary PWM mode
	1	Channels 3 and 4 operate together in reset-synchronized PWM mode

Before selecting reset-synchronized PWM mode or complementary PWM mode, halt the timer counter or counters that will be used in these modes.

When these bits select complementary PWM mode or reset-synchronized PWM mode, they take precedence over the setting of the PWM mode bits (PWM4 and PWM3) in TMDR. Settings of timer sync bits SYNC4 and SYNC3 in TSNC are valid in complementary PWM mode and reset-synchronized PWM mode, however. When complementary PWM mode is selected, channels 3 and 4 must not be synchronized (do not set bits SYNC3 and SYNC4 both to 1 in TSNC).

Bit 3—Buffer Mode B4 (BFB4): Selects whether GRB4 operates normally in channel 4, or whether GRB4 is buffered by BRB4.

Bit 3: BFB4	Description	
0	GRB4 operates normally	(Initial value)
1	GRB4 is buffered by BRB4	

Bit 2—Buffer Mode A4 (BFA4): Selects whether GRA4 operates normally in channel 4, or whether GRA4 is buffered by BRA4.

Bit 2: BFA4	Description	
0	GRA4 operates normally	(Initial value)
1	GRA4 is buffered by BRA4	

Bit 1—Buffer Mode B3 (BFB3): Selects whether GRB3 operates normally in channel 3, or whether GRB3 is buffered by BRB3.

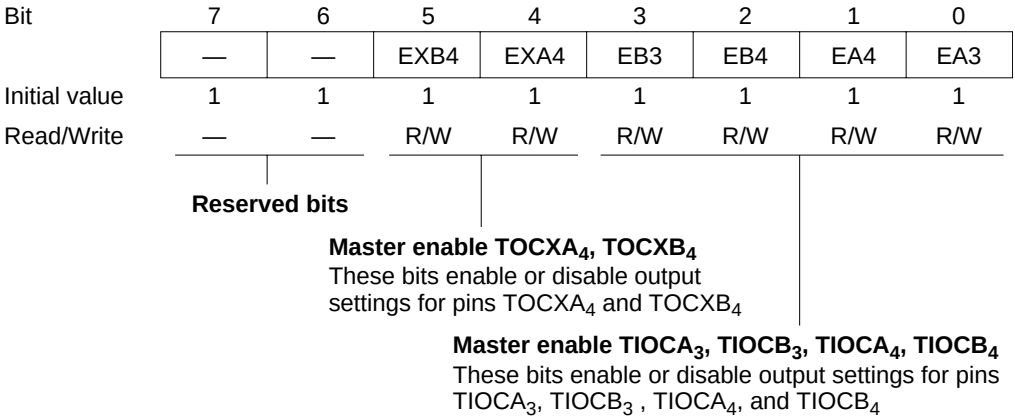
Bit 1: BFB3	Description	
0	GRB3 operates normally	(Initial value)
1	GRB3 is buffered by BRB3	

Bit 0—Buffer Mode A3 (BFA3): Selects whether GRA3 operates normally in channel 3, or whether GRA3 is buffered by BRA3.

Bit 0: BFA3	Description	
0	GRA3 operates normally	(Initial value)
1	GRA3 is buffered by BRA3	

10.2.5 Timer Output Master Enable Register (TOER)

TOER is an 8-bit readable/writable register that enables or disables output settings for channels 3 and 4.



TOER is initialized to H'FF by a reset and in standby mode.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bit 5—Master Enable TOCXB4 (EXB4): Enables or disables ITU output at pin $TOCXB_4$.

Bit 5: EXB4	Description
0	$TOCXB_4$ output is disabled regardless of TFCR settings ($TOCXB_4$ operates as a generic input/output pin). If XTGD = 0, EXB4 is cleared to 0 when input capture A occurs in channel 1.
1	$TOCXB_4$ is enabled for output according to TFCR settings (Initial value)

Bit 4—Master Enable TOCXA4 (EXA4): Enables or disables ITU output at pin $TOCXA_4$.

Bit 4: EXA4	Description
0	$TOCXA_4$ output is disabled regardless of TFCR settings ($TOCXA_4$ operates as a generic input/output pin). If XTGD = 0, EXA4 is cleared to 0 when input capture A occurs in channel 1.
1	$TOCXA_4$ is enabled for output according to TFCR settings (Initial value)

Bit 3—Master Enable TIOCB3 (EB3): Enables or disables ITU output at pin $TIOCB_3$.

Bit 3: EB3	Description
0	$TIOCB_3$ output is disabled regardless of TIOR3 and TFCR settings ($TIOCB_3$ operates as a generic input/output pin). If XTGD = 0, EB3 is cleared to 0 when input capture A occurs in channel 1.
1	$TIOCB_3$ is enabled for output according to TIOR3 and TFCR settings (Initial value)

Bit 2—Master Enable TIOCB4 (EB4): Enables or disables ITU output at pin $TIOCB_4$.

Bit 2: EB4	Description
0	$TIOCB_4$ output is disabled regardless of TIOR4 and TFCR settings ($TIOCB_4$ operates as a generic input/output pin). If XTGD = 0, EB4 is cleared to 0 when input capture A occurs in channel 1.
1	$TIOCB_4$ is enabled for output according to TIOR4 and TFCR settings (Initial value)

Bit 1—Master Enable TIOCA4 (EA4): Enables or disables ITU output at pin $TIOCA_4$.

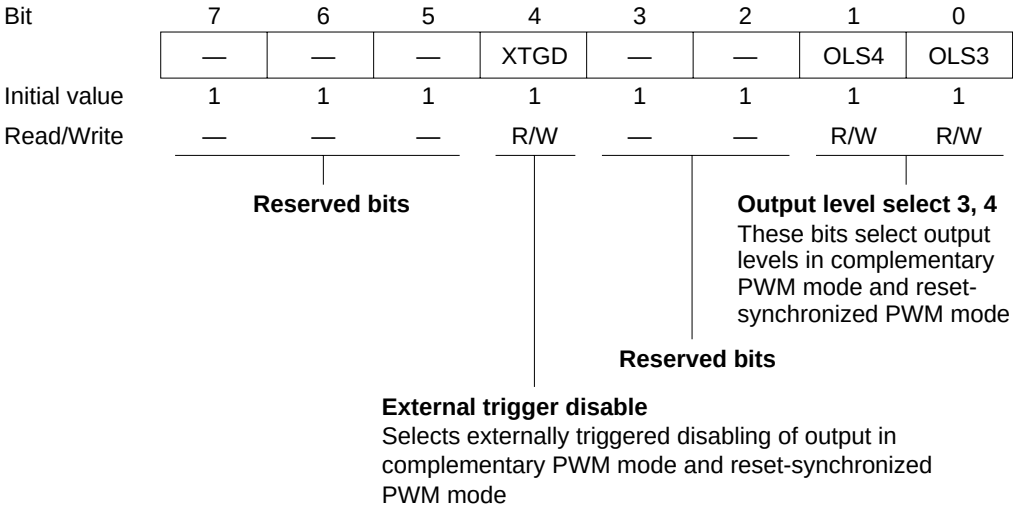
Bit 1: EA4	Description
0	$TIOCA_4$ output is disabled regardless of TIOR4, TMDR, and TFCR settings ($TIOCA_4$ operates as a generic input/output pin). If XTGD = 0, EA4 is cleared to 0 when input capture A occurs in channel 1.
1	$TIOCA_4$ is enabled for output according to TIOR4, TMDR, and TFCR settings (Initial value)

Bit 0—Master Enable TIOCA3 (EA3): Enables or disables ITU output at pin $TIOCA_3$.

Bit 0: EA3	Description
0	$TIOCA_3$ output is disabled regardless of TIOR3, TMDR, and TFCR settings ($TIOCA_3$ operates as a generic input/output pin). If XTGD = 0, EA3 is cleared to 0 when input capture A occurs in channel 1.
1	$TIOCA_3$ is enabled for output according to TIOR3, TMDR, and TFCR settings (Initial value)

10.2.6 Timer Output Control Register (TOCR)

TOCR is an 8-bit readable/writable register that selects externally triggered disabling of output in complementary PWM mode and reset-synchronized PWM mode, and inverts the output levels.



The settings of the XTGD, OLS4, and OLS3 bits are valid only in complementary PWM mode and reset-synchronized PWM mode. These settings do not affect other modes.

TOCR is initialized to H'FF by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—External Trigger Disable (XTGD): Selects externally triggered disabling of ITU output in complementary PWM mode and reset-synchronized PWM mode.

Bit 4: XTGD	Description
0	Input capture A in channel 1 is used as an external trigger signal in complementary PWM mode and reset-synchronized PWM mode. When an external trigger occurs, bits 5 to 0 in TOER are cleared to 0, disabling ITU output.
1	External triggering is disabled (Initial value)

Bits 3 and 2—Reserved: Read-only bits, always read as 1.

Bit 1—Output Level Select 4 (OLS4): Selects output levels in complementary PWM mode and reset-synchronized PWM mode.

Bit 1: OLS4	Description	
0	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are inverted	
1	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are not inverted	(Initial value)

Bit 0—Output Level Select 3 (OLS3): Selects output levels in complementary PWM mode and reset-synchronized PWM mode.

Bit 0: OLS3	Description	
0	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are inverted	
1	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are not inverted	(Initial value)

10.2.7 Timer Counters (TCNT)

TCNT is a 16-bit counter. The ITU has five TCNTs, one for each channel.

Channel	Abbreviation	Function
0	TCNT0	Up-counter
1	TCNT1	
2	TCNT2	Phase counting mode: up/down-counter
		Other modes: up-counter
3	TCNT3	Complementary PWM mode: up/down-counter
4	TCNT4	Other modes: up-counter

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Each TCNT is a 16-bit readable/writable register that counts pulse inputs from a clock source. The clock source is selected by bits TPSC2 to TPSC0 in TCR.

TCNT0 and TCNT1 are up-counters. TCNT2 is an up/down-counter in phase counting mode and an up-counter in other modes. TCNT3 and TCNT4 are up/down-counters in complementary PWM mode and up-counters in other modes.

TCNT can be cleared to H'0000 by compare match with GRA or GRB or by input capture to GRA or GRB (counter clearing function) in the same channel.

When TCNT overflows (changes from H'FFFF to H'0000), the OVF flag is set to 1 in TSR of the corresponding channel.

When TCNT underflows (changes from H'0000 to H'FFFF), the OVF flag is set to 1 in TSR of the corresponding channel.

The TCNTs are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

Each TCNT is initialized to H'0000 by a reset and in standby mode.

10.2.8 General Registers (GRA, GRB)

The general registers are 16-bit registers. The ITU has 10 general registers, two in each channel.

Channel	Abbreviation	Function
0	GRA0, GRB0	Output compare/input capture register
1	GRA1, GRB1	
2	GRA2, GRB2	
3	GRA3, GRB3	Output compare/input capture register; can be buffered by buffer registers BRA and BRB
4	GRA4, GRB4	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A general register is a 16-bit readable/writable register that can function as either an output compare register or an input capture register. The function is selected by settings in TIOR.

When a general register is used as an output compare register, its value is constantly compared with the TCNT value. When the two values match (compare match), the IMFA or IMFB flag is set to 1 in TSR. Compare match output can be selected in TIOR.

When a general register is used as an input capture register, rising edges, falling edges, or both edges of an external input capture signal are detected and the current TCNT value is stored in the

general register. The corresponding IMFA or IMFB flag in TSR is set to 1 at the same time. The valid edge or edges of the input capture signal are selected in TIOR.

TIOR settings are ignored in PWM mode, complementary PWM mode, and reset-synchronized PWM mode.

General registers are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

General registers are initialized to the output compare function (with no output signal) by a reset and in standby mode. The initial value is H'FFFF.

10.2.9 Buffer Registers (BRA, BRB)

The buffer registers are 16-bit registers. The ITU has four buffer registers, two each in channels 3 and 4.

Channel	Abbreviation	Function
3	BRA3, BRB3	Used for buffering
4	BRA4, BRB4	• When the corresponding GRA or GRB functions as an output compare register, BRA or BRB can function as an output compare buffer register: the BRA or BRB value is automatically transferred to GRA or GRB at compare match • When the corresponding GRA or GRB functions as an input capture register, BRA or BRB can function as an input capture buffer register: the GRA or GRB value is automatically transferred to BRA or BRB at input capture

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A buffer register is a 16-bit readable/writable register that is used when buffering is selected. Buffering can be selected independently by bits BFB4, BFA4, BFB3, and BFA3 in TFCR.

The buffer register and general register operate as a pair. When the general register functions as an output compare register, the buffer register functions as an output compare buffer register. When the general register functions as an input capture register, the buffer register functions as an input capture buffer register.

The buffer registers are linked to the CPU by an internal 16-bit bus and can be written or read by either word or byte access.

Buffer registers are initialized to H'FFFF by a reset and in standby mode.

10.2.10 Timer Control Registers (TCR)

TCR is an 8-bit register. The ITU has five TCRs, one in each channel.

Channel	Abbreviation	Function
0	TCR0	TCR controls the timer counter. The TCRs in all channels are functionally identical. When phase counting mode is selected in channel 2, the settings of bits CKEG1 and CKEG0 and TPSC2 to TPSC0 in TCR2 are ignored.
1	TCR1	
2	TCR2	
3	TCR3	
4	TCR4	

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Timer prescaler 2 to 0
These bits select the counter clock

Clock edge 1/0
These bits select external clock edges

Counter clear 1/0
These bits select the counter clear source

Reserved bit

Each TCR is an 8-bit readable/writable register that selects the timer counter clock source, selects the edge or edges of external clock sources, and selects how the counter is cleared.

TCR is initialized to H'80 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bits 6 and 5—Counter Clear 1/0 (CCLR1, CCLR0): These bits select how TCNT is cleared.

Bit 6: CCLR1	Bit 5: CCLR0	Description	
0	0	TCNT is not cleared	(Initial value)
	1	TCNT is cleared by GRA compare match or input capture*1	
1	0	TCNT is cleared by GRB compare match or input capture*1	
	1	Synchronous clear: TCNT is cleared in synchronization with other synchronized timers*2	

Notes: 1. TCNT is cleared by compare match when the general register functions as an output compare register, and by input capture when the general register functions as an input capture register.
2. Selected in TSNC.

Bits 4 and 3—Clock Edge 1/0 (CKEG1, CKEG0): These bits select external clock input edges when an external clock source is used.

Bit 4: CKEG1	Bit 3: CKEG0	Description	
0	0	Count rising edges	(Initial value)
	1	Count falling edges	
1	—	Count both edges	

When channel 2 is set to phase counting mode, bits CKEG1 and CKEG0 in TCR2 are ignored. Phase counting takes precedence.

Bits 2 to 0—Timer Prescaler 2 to 0 (TPSC2 to TPSC0): These bits select the counter clock source.

Bit 2: TPSC2	Bit 1: TPSC1	Bit 0: TPSC0	Description	
0	0	0	Internal clock: ϕ	(Initial value)
		1	Internal clock: $\phi/2$	
	1	0	Internal clock: $\phi/4$	
		1	Internal clock: $\phi/8$	
1	0	0	External clock A: TCLKA input	
		1	External clock B: TCLKB input	
	1	0	External clock C: TCLKC input	
		1	External clock D: TCLKD input	

When bit TPSC2 is cleared to 0 an internal clock source is selected, and the timer counts only falling edges. When bit TPSC2 is set to 1 an external clock source is selected, and the timer counts the edge or edges selected by bits CKEG1 and CKEG0.

When channel 2 is set to phase counting mode (MDF = 1 in TMDR), the settings of bits TPSC2 to TPSC0 in TCR2 are ignored. Phase counting takes precedence.

10.2.11 Timer I/O Control Register (TIOR)

TIOR is an 8-bit register. The ITU has five TIORs, one in each channel.

Channel	Abbreviation	Function
0	TIOR0	TIOR controls the general registers. Some functions differ in PWM mode. TIOR3 and TIOR4 settings are ignored when complementary PWM mode or reset-synchronized PWM mode is selected in channels 3 and 4.
1	TIOR1	
2	TIOR2	
3	TIOR3	
4	TIOR4	

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

I/O control A2 to A0
These bits select GRA functions

Reserved bit

I/O control B2 to B0
These bits select GRB functions

Reserved bit

Each TIOR is an 8-bit readable/writable register that selects the output compare or input capture function for GRA and GRB, and specifies the functions of the TIOCA and TIOCB pins. If the output compare function is selected, TIOR also selects the type of output. If input capture is selected, TIOR also selects the edge or edges of the input capture signal.

TIOR is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bits 6 to 4—I/O Control B2 to B0 (IOB2 to IOB0): These bits select the GRB function.

Bit 6: IOB2	Bit 5: IOB1	Bit 4: IOB0	Description	
0	0	0	GRB is an output compare register	No output at compare match (Initial value)
		1		0 output at GRB compare match*1
	1	0		1 output at GRB compare match*1
		1		Output toggles at GRB compare match (1 output in channel 2)*1*2
1	0	0	GRB is an input capture register	GRB captures rising edge of input
		1		GRB captures falling edge of input
	1	0		GRB captures both edges of input
		1		

Notes: 1. After a reset, the output is 0 until the first compare match.
2. Channel 2 output cannot be toggled by compare match. This setting selects 1 output instead.

Bit 3—Reserved: Read-only bit, always read as 1.

Bits 2 to 0—I/O Control A2 to A0 (IOA2 to IOA0): These bits select the GRA function.

Bit 2: IOA2	Bit 1: IOA1	Bit 0: IOA0	Description	
0	0	0	GRA is an output compare register	No output at compare match (Initial value)
		1		0 output at GRA compare match*1
	1	0		1 output at GRA compare match*1
		1		Output toggles at GRA compare match (1 output in channel 2)*1*2
1	0	0	GRA is an input capture register	GRA captures rising edge of input
		1		GRA captures falling edge of input
	1	0		GRA captures both edges of input
		1		

Notes: 1. After a reset, the output is 0 until the first compare match.
2. Channel 2 output cannot be toggled by compare match. This setting selects 1 output instead.

10.2.12 Timer Status Register (TSR)

TSR is an 8-bit register. The ITU has five TSRs, one in each channel.

Channel	Abbreviation	Function
0	TSR0	Indicates input capture, compare match, and overflow status
1	TSR1	
2	TSR2	
3	TSR3	
4	TSR4	

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Reserved bits

Overflow flag
Status flag indicating overflow or underflow

Input capture/compare match flag B
Status flag indicating GRB compare match or input capture

Input capture/compare match flag A
Status flag indicating GRA compare match or input capture

Note: * Only 0 can be written, to clear the flag.

Each TSR is an 8-bit readable/writable register containing flags that indicate TCNT overflow or underflow and GRA or GRB compare match or input capture. These flags are interrupt sources and generate CPU interrupts if enabled by corresponding bits in TIER.

TSR is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: Read-only bits, always read as 1.

Bit 2—Overflow Flag (OVF): This status flag indicates TCNT overflow or underflow.

Bit 2: OVF	Description
0	[Clearing condition] (Initial value) Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] TCNT overflowed from H'FFFF to H'0000, or underflowed from H'0000 to H'FFFF*

Notes: * TCNT underflow occurs when TCNT operates as an up/down-counter. Underflow occurs only under the following conditions:
1. Channel 2 operates in phase counting mode (MDF = 1 in TMDR)
2. Channels 3 and 4 operate in complementary PWM mode (CMD1 = 1 and CMD0 = 0 in TFCR)

Bit 1—Input Capture/Compare Match Flag B (IMFB): This status flag indicates GRB compare match or input capture events.

Bit 1: IMFB	Description
0	[Clearing condition] (Initial value) Read IMFB when IMFB = 1, then write 0 in IMFB
1	[Setting conditions] • TCNT = GRB when GRB functions as an output compare register. • TCNT value is transferred to GRB by an input capture signal, when GRB functions as an input capture register.

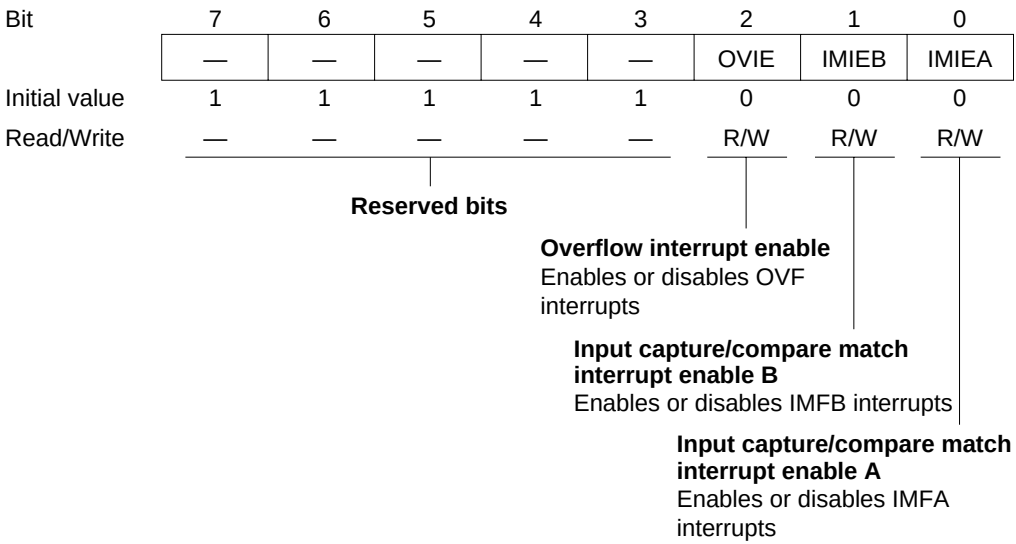
Bit 0—Input Capture/Compare Match Flag A (IMFA): This status flag indicates GRA compare match or input capture events.

Bit 0: IMFA	Description
0	[Clearing condition] (Initial value) Read IMFA when IMFA = 1, then write 0 in IMFA. DMAC activated by IMIA interrupt (channels 0 to 3 only).
1	[Setting conditions] • TCNT = GRA when GRA functions as an output compare register. • TCNT value is transferred to GRA by an input capture signal, when GRA functions as an input capture register.

10.2.13 Timer Interrupt Enable Register (TIER)

TIER is an 8-bit register. The ITU has five TIERs, one in each channel.

Channel	Abbreviation	Function
0	TIER0	Enables or disables interrupt requests.
1	TIER1	
2	TIER2	
3	TIER3	
4	TIER4	



Each TIER is an 8-bit readable/writable register that enables and disables overflow interrupt requests and general register input capture and compare match interrupt requests.

TIER is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: Read-only bits, always read as 1.

Bit 2—Overflow Interrupt Enable (OVIE): Enables or disables the interrupt requested by the OVF flag in TSR when OVF is set to 1.

Bit 2: OVIE	Description	
0	OVI interrupt requested by OVF is disabled	(Initial value)
1	OVI interrupt requested by OVF is enabled	

Bit 1—Input Capture/Compare Match Interrupt Enable B (IMIEB): Enables or disables the interrupt requested by the IMFB flag in TSR when IMFB is set to 1.

Bit 1: IMIEB	Description	
0	IMIB interrupt requested by IMFB is disabled	(Initial value)
1	IMIB interrupt requested by IMFB is enabled	

Bit 0—Input Capture/Compare Match Interrupt Enable A (IMIEA): Enables or disables the interrupt requested by the IMFA flag in TSR when IMFA is set to 1.

Bit 0: IMIEA	Description	
0	IMIA interrupt requested by IMFA is disabled	(Initial value)
1	IMIA interrupt requested by IMFA is enabled	

10.3 CPU Interface

10.3.1 16-Bit Accessible Registers

The timer counters (TCNTs), general registers A and B (GRAs and GRBs), and buffer registers A and B (BRAs and BRBs) are 16-bit registers, and are linked to the CPU by an internal 16-bit data bus. These registers can be written or read a word at a time, or a byte at a time.

Figures 10.6 and 10.7 show examples of word access to a timer counter (TCNT). Figures 10.8, 10.9, 10.10, and 10.11 show examples of byte access to TCNTH and TCNTL.

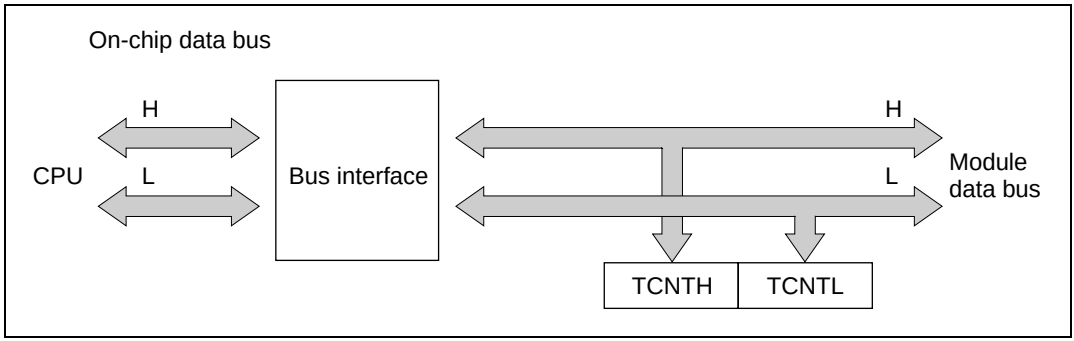


Figure 10.6 Access to Timer Counter (CPU Writes to TCNT, Word)

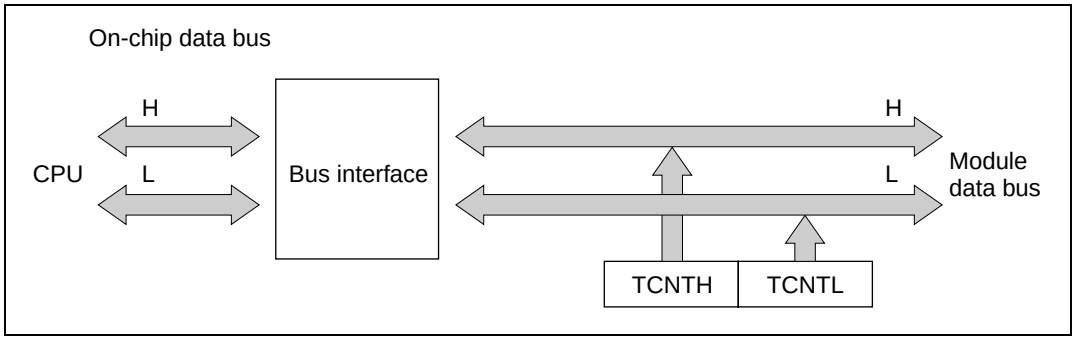

Figure 10.7 Access to Timer Counter (CPU Reads TCNT, Word)

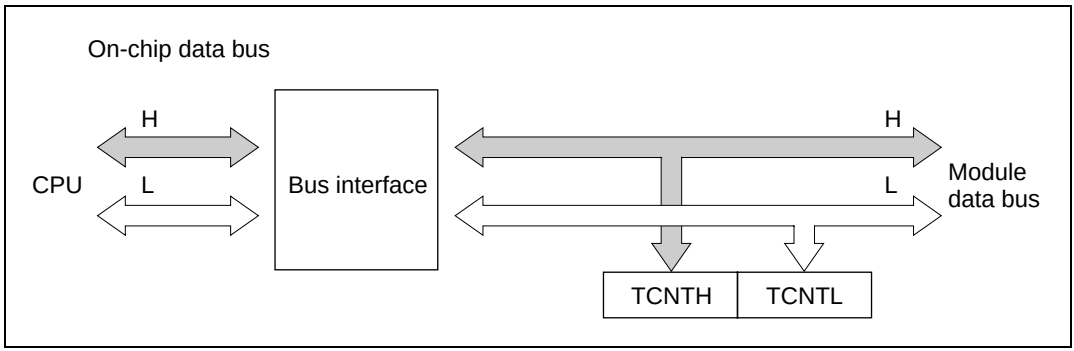

Figure 10.8 Access to Timer Counter (CPU Writes to TCNT, Upper Byte)

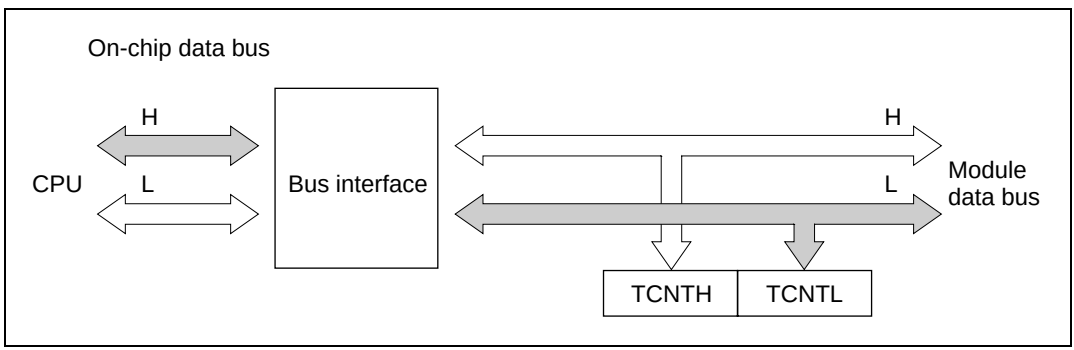

Figure 10.9 Access to Timer Counter (CPU Writes to TCNT, Lower Byte)

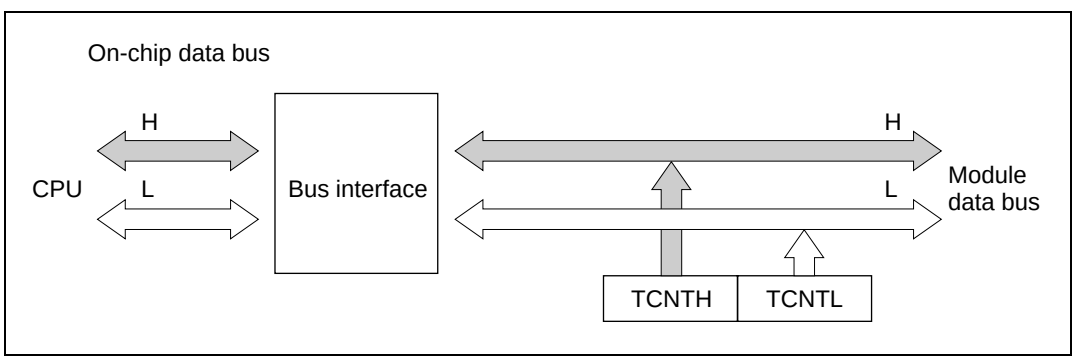

Figure 10.10 Access to Timer Counter (CPU Reads TCNT, Upper Byte)

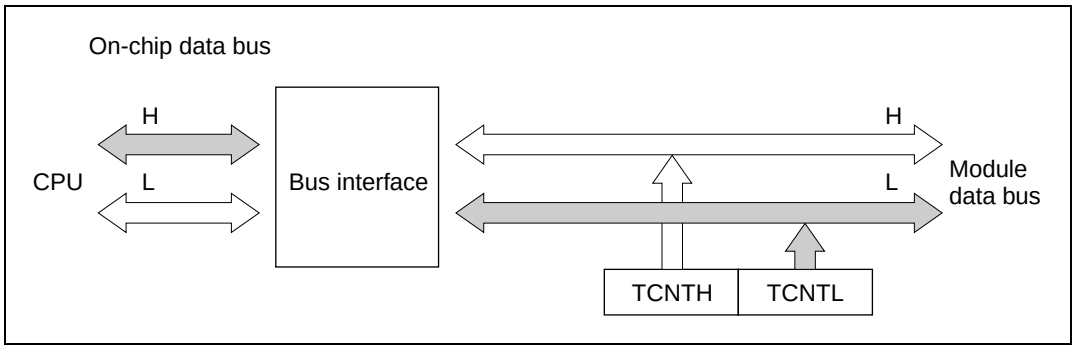

Figure 10.11 Access to Timer Counter (CPU Reads TCNT, Lower Byte)

10.3.2 8-Bit Accessible Registers

The registers other than the timer counters (TCNTS), general registers A and B (GRAs and GRBs), and buffer registers A and B (BRAs and BRBs) are 8-bit registers. These registers are linked to the CPU by an internal 8-bit data bus.

Figures 10.12 and 10.13 show examples of byte read and write access to a TCR.

If a word-size data transfer instruction is executed, two byte transfers are performed.

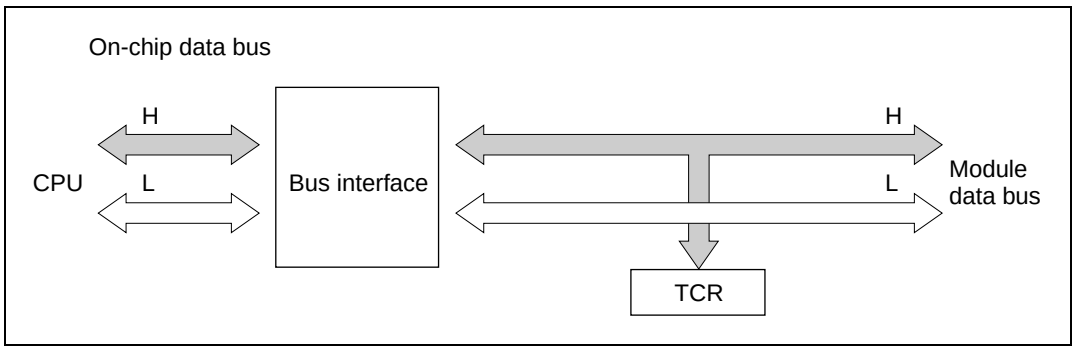

Figure 10.12 Access to Timer Counter (CPU Writes to TCR)

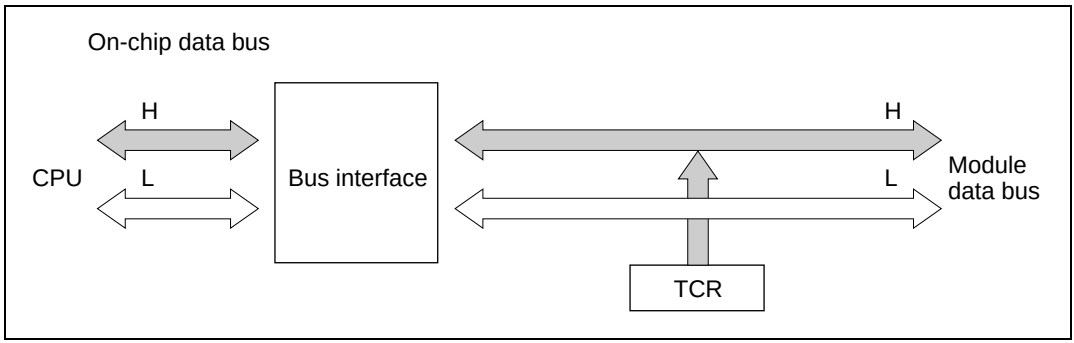

Figure 10.13 Access to Timer Counter (CPU Reads TCR)

10.4 Operation

10.4.1 Overview

A summary of operations in the various modes is given below.

Normal Operation: Each channel has a timer counter and general registers. The timer counter counts up, and can operate as a free-running counter, periodic counter, or external event counter. General registers A and B can be used for input capture or output compare.

Synchronous Operation: The timer counters in designated channels are preset synchronously. Data written to the timer counter in any one of these channels is simultaneously written to the timer counters in the other channels as well. The timer counters can also be cleared synchronously if so designated by the CCLR1 and CCLR0 bits in the TCRs.

PWM Mode: A PWM waveform is output from the TIOCA pin. The output goes to 1 at compare match A and to 0 at compare match B. The duty cycle can be varied from 0% to 100% depending on the settings of GRA and GRB. When a channel is set to PWM mode, its GRA and GRB automatically become output compare registers.

Reset-Synchronized PWM Mode: Channels 3 and 4 are paired for three-phase PWM output with complementary waveforms. (The three phases are related by having a common transition point.) When reset-synchronized PWM mode is selected GRA3, GRB3, GRA4, and GRB4 automatically function as output compare registers, $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TOCXA_4$, $TIOCB_4$, and $TOCXB_4$ function as PWM output pins, and TCNT3 operates as an up-counter. TCNT4 operates independently, and is not compared with GRA4 or GRB4.

Complementary PWM Mode: Channels 3 and 4 are paired for three-phase PWM output with non-overlapping complementary waveforms. When complementary PWM mode is selected GRA3, GRB3, GRA4, and GRB4 automatically function as output compare registers, and $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TOCXA_4$, $TIOCB_4$, and $TOCXB_4$ function as PWM output pins. TCNT3 and TCNT4 operate as up/down-counters.

Phase Counting Mode: The phase relationship between two clock signals input at TCLKA and TCLKB is detected and TCNT2 counts up or down accordingly. When phase counting mode is selected TCLKA and TCLKB become clock input pins and TCNT2 operates as an up/down-counter.

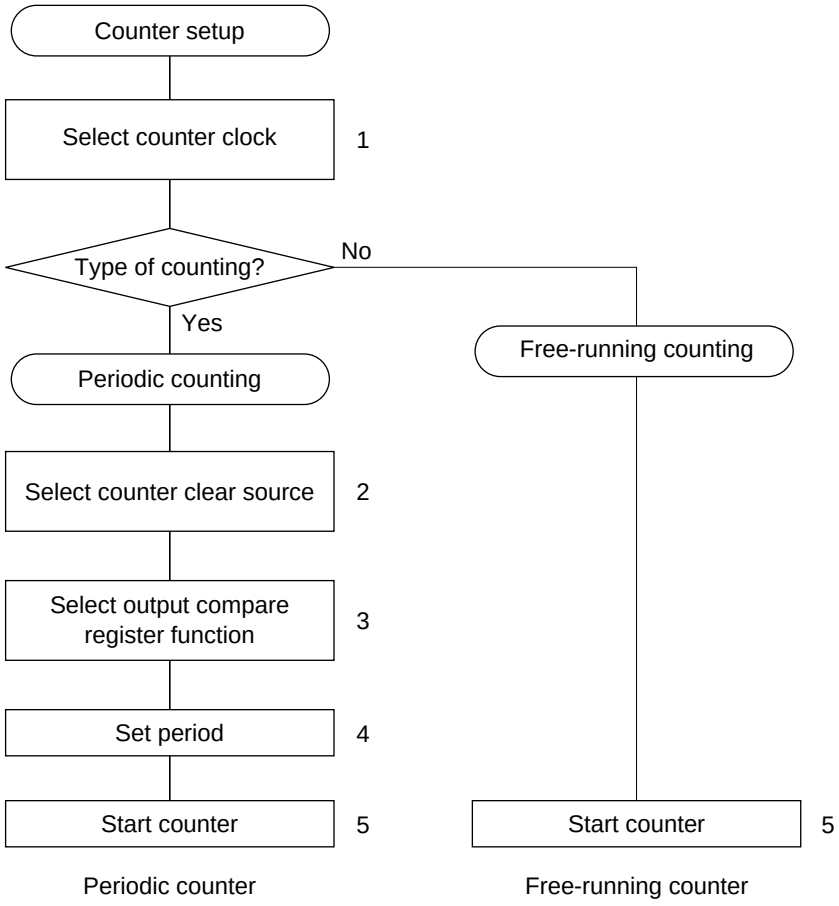
Buffering

- If the general register is an output compare register
  When compare match occurs the buffer register value is transferred to the general register.
- If the general register is an input capture register
  When input capture occurs the TCNT value is transferred to the general register, and the previous general register value is transferred to the buffer register.
- Complementary PWM mode
  The buffer register value is transferred to the general register when TCNT3 and TCNT4 change counting direction.
- Reset-synchronized PWM mode
  The buffer register value is transferred to the general register at GRA3 compare match.

10.4.2 Basic Functions

Counter Operation: When one of bits STR0 to STR4 is set to 1 in the timer start register (TSTR), the timer counter (TCNT) in the corresponding channel starts counting. The counting can be free-running or periodic.

- Sample setup procedure for counter
  Figure 10.14 shows a sample procedure for setting up a counter.



1. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source. If an external clock source is selected, set bits CKEG1 and CKEG0 in TCR to select the desired edge(s) of the external clock signal.
2. For periodic counting, set CCLR1 and CCLR0 in TCR to have TCNT cleared at GRA compare match or GRB compare match.
3. Set TIOR to select the output compare function of GRA or GRB, whichever was selected in step 2.
4. Write the count period in GRA or GRB, whichever was selected in step 2.
5. Set the STR bit to 1 in TSTR to start the timer counter.

Figure 10.14 Counter Setup Procedure (Example)

- Free-running and periodic counter operation

  A reset leaves the counters (TCNTs) in ITU channels 0 to 4 all set as free-running counters. A free-running counter starts counting up when the corresponding bit in TSTR is set to 1. When the count overflows from H'FFFF to H'0000, the OVF flag is set to 1 in TSR. If the corresponding OVIE bit is set to 1 in TIER, a CPU interrupt is requested. After the overflow, the counter continues counting up from H'0000. Figure 10.15 illustrates free-running counting.

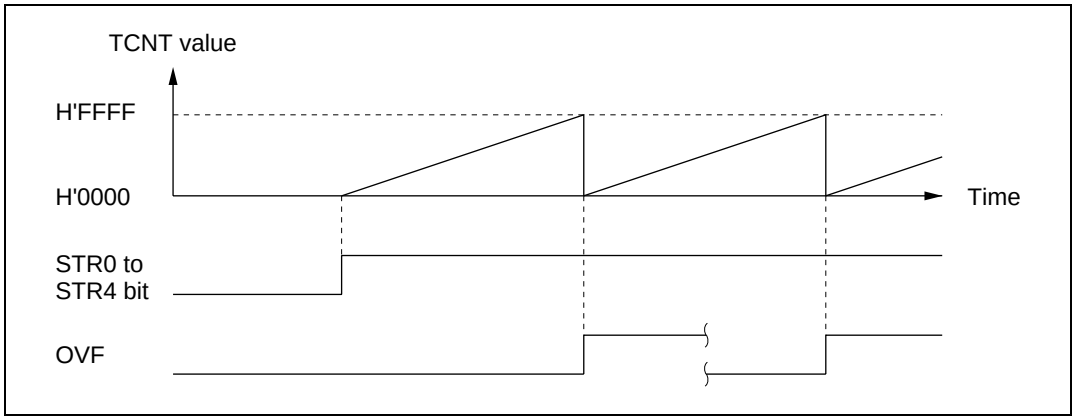


Figure 10.15 Free-Running Counter Operation

When a channel is set to have its counter cleared by compare match, in that channel TCNT operates as a periodic counter. Select the output compare function of GRA or GRB, set bit CCLR1 or CCLR0 in TCR to have the counter cleared by compare match, and set the count period in GRA or GRB. After these settings, the counter starts counting up as a periodic counter when the corresponding bit is set to 1 in TSTR. When the count matches GRA or GRB, the IMFA or IMFB flag is set to 1 in TSR and the counter is cleared to H'0000. If the corresponding IMIEA or IMIEB bit is set to 1 in TIER, a CPU interrupt is requested at this time. After the compare match, TCNT continues counting up from H'0000. Figure 10.16 illustrates periodic counting.

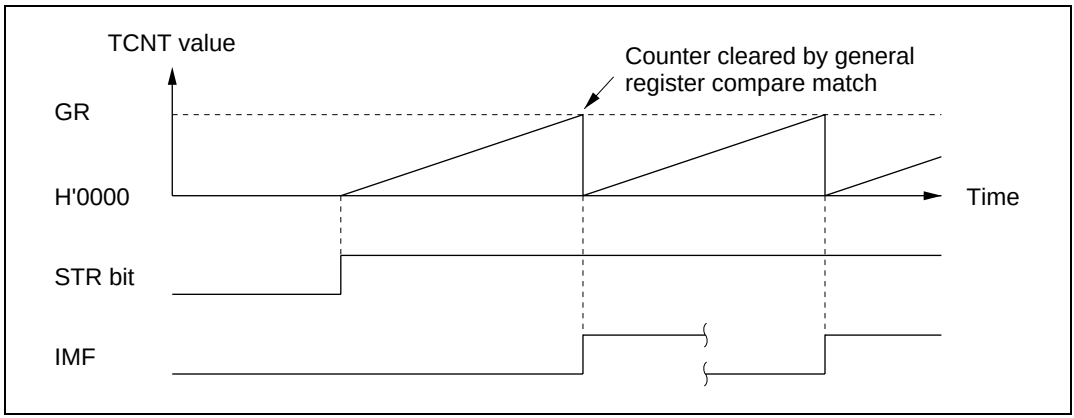

Figure 10.16 Periodic Counter Operation

- TCNT count timing
  - — Internal clock source

    Bits TPSC2 to TPSC0 in TCR select the system clock (ϕ) or one of three internal clock sources obtained by prescaling the system clock (ϕ/2, ϕ/4, ϕ/8).

    Figure 10.17 shows the timing.

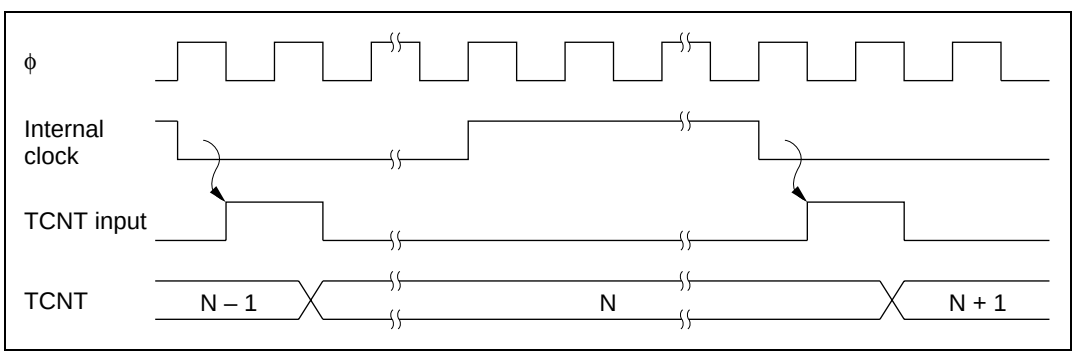

Figure 10.17 Count Timing for Internal Clock Sources

  - — External clock source

    Bits TPSC2 to TPSC0 in TCR select an external clock input pin (TCLKA to TCLKD), and its valid edge or edges are selected by bits CKEG1 and CKEG0. The rising edge, falling edge, or both edges can be selected.

    The pulse width of the external clock signal must be at least 1.5 system clocks when a single edge is selected, and at least 2.5 system clocks when both edges are selected. Shorter pulses will not be counted correctly.

    Figure 10.18 shows the timing when both edges are detected.

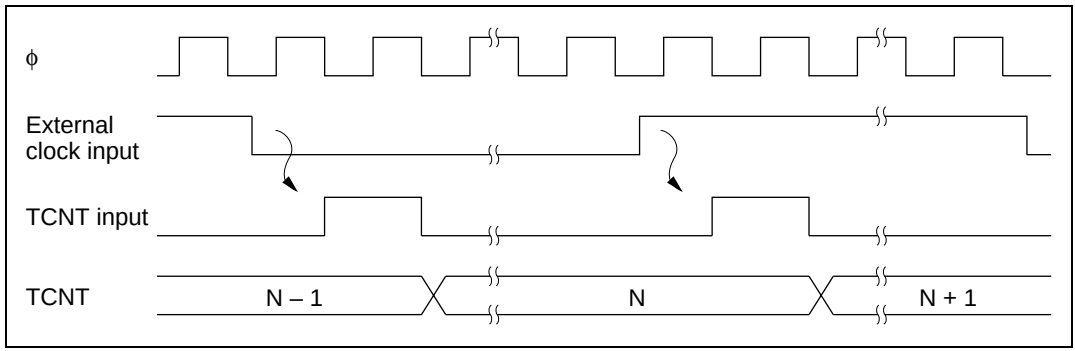

Figure 10.18 Count Timing for External Clock Sources (when Both Edges Are Detected)

Waveform Output by Compare Match: In ITU channels 0, 1, 3, and 4, compare match A or B can cause the output at the TIOCA or TIOCB pin to go to 0, go to 1, or toggle. In channel 2 the output can only go to 0 or go to 1.

- Sample setup procedure for waveform output by compare match
  Figure 10.19 shows a sample procedure for setting up waveform output by compare match.

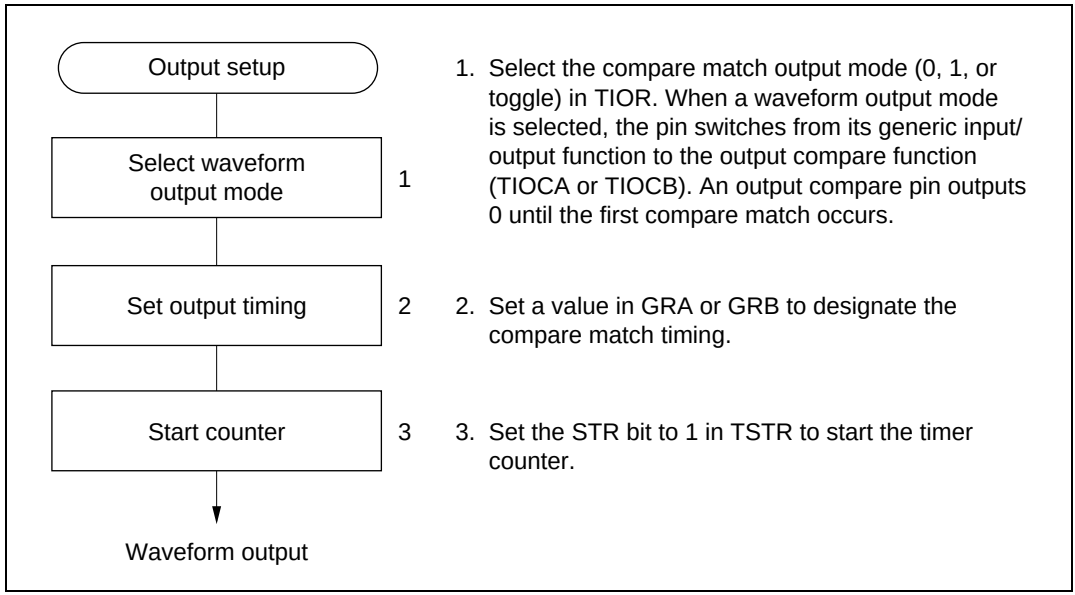

Figure 10.19 Setup Procedure for Waveform Output by Compare Match (Example)

- Examples of waveform output

  Figure 10.20 shows examples of 0 and 1 output. TCNT operates as a free-running counter, 0 output is selected for compare match A, and 1 output is selected for compare match B. When the pin is already at the selected output level, the pin level does not change.

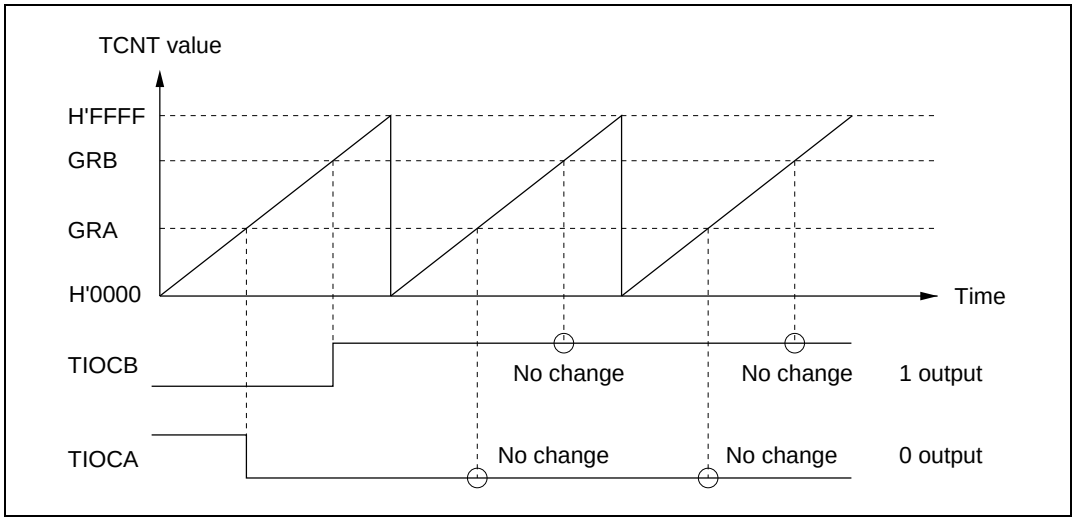

Figure 10.20 0 and 1 Output (Examples)

Figure 10.21 shows examples of toggle output. TCNT operates as a periodic counter, cleared by compare match B. Toggle output is selected for both compare match A and B.

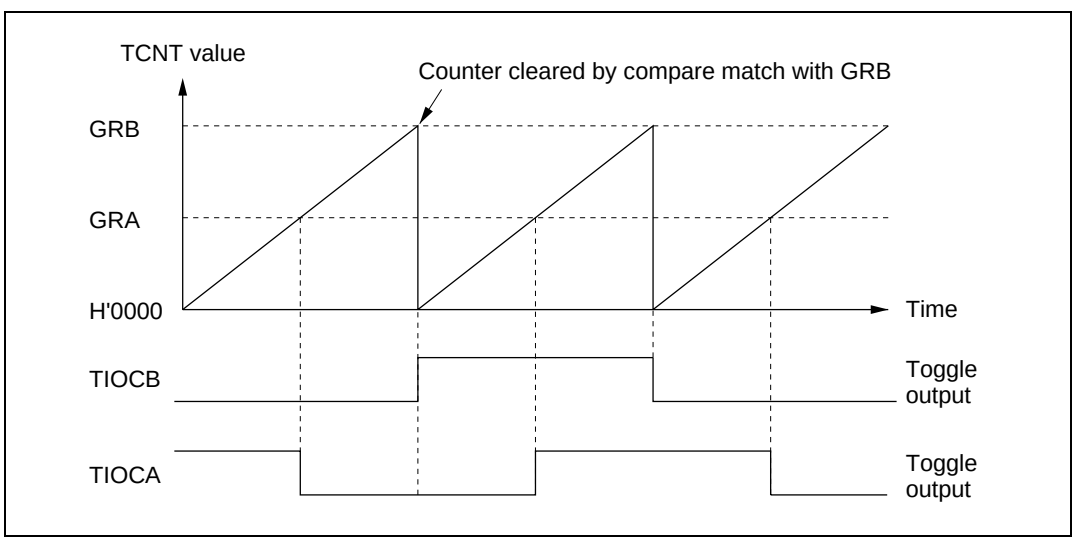

Figure 10.21 Toggle Output (Example)

- Output compare timing

  The compare match signal is generated in the last state in which TCNT and the general register match (when TCNT changes from the matching value to the next value). When the compare match signal is generated, the output value selected in TIOR is output at the output compare pin (TIOCA or TIOCB). When TCNT matches a general register, the compare match signal is not generated until the next counter clock pulse.

  Figure 10.22 shows the output compare timing.

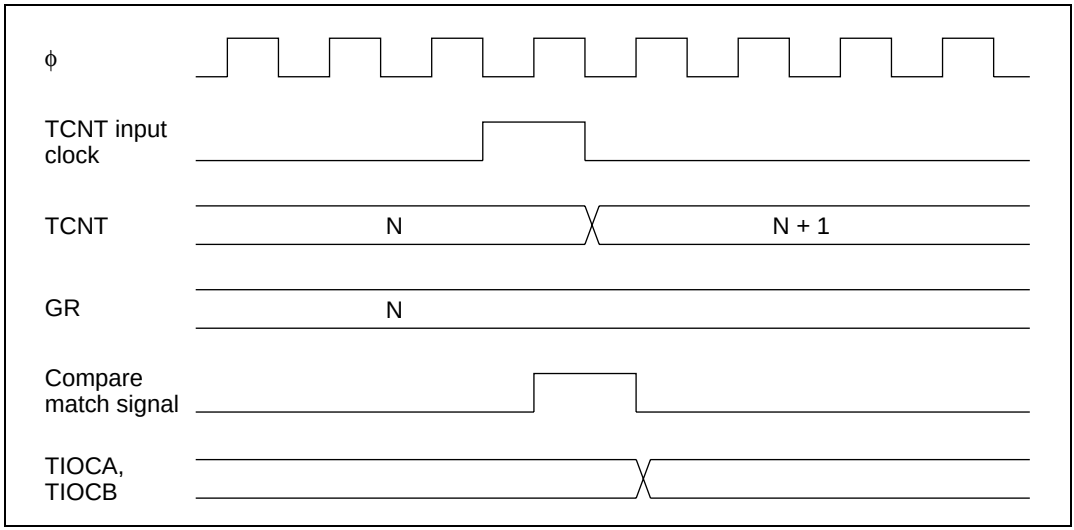

Figure 10.22 Output Compare Timing

Input Capture Function: The TCNT value can be captured into a general register when a transition occurs at an input capture/output compare pin (TIOCA or TIOCB). Capture can take place on the rising edge, falling edge, or both edges. The input capture function can be used to measure pulse width or period.

- Sample setup procedure for input capture

  Figure 10.23 shows a sample procedure for setting up input capture.

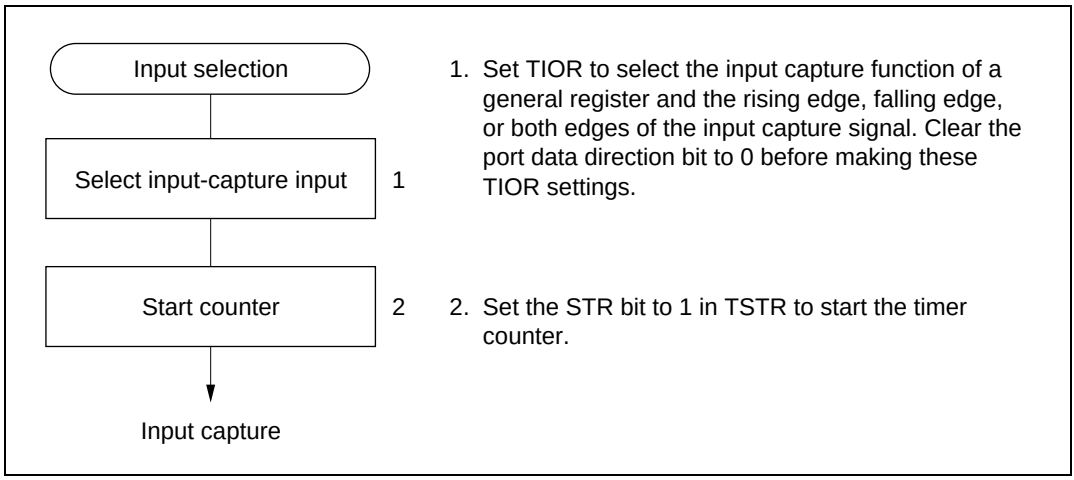

Figure 10.23 Setup Procedure for Input Capture (Example)

- Examples of input capture

  Figure 10.24 illustrates input capture when the falling edge of TIOCB and both edges of TIOCA are selected as capture edges. TCNT is cleared by input capture into GRB.

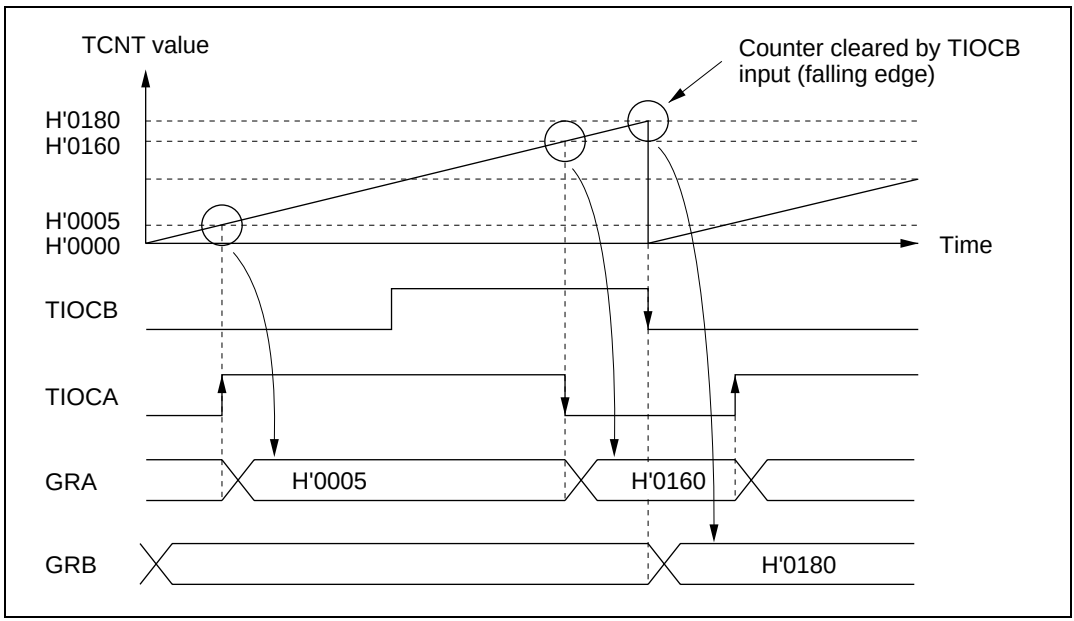

Figure 10.24 Input Capture (Example)

- Input capture signal timing

  Input capture on the rising edge, falling edge, or both edges can be selected by settings in TIOR. Figure 10.25 shows the timing when the rising edge is selected. The pulse width of the input capture signal must be at least 1.5 system clocks for single-edge capture, and 2.5 system clocks for capture of both edges.

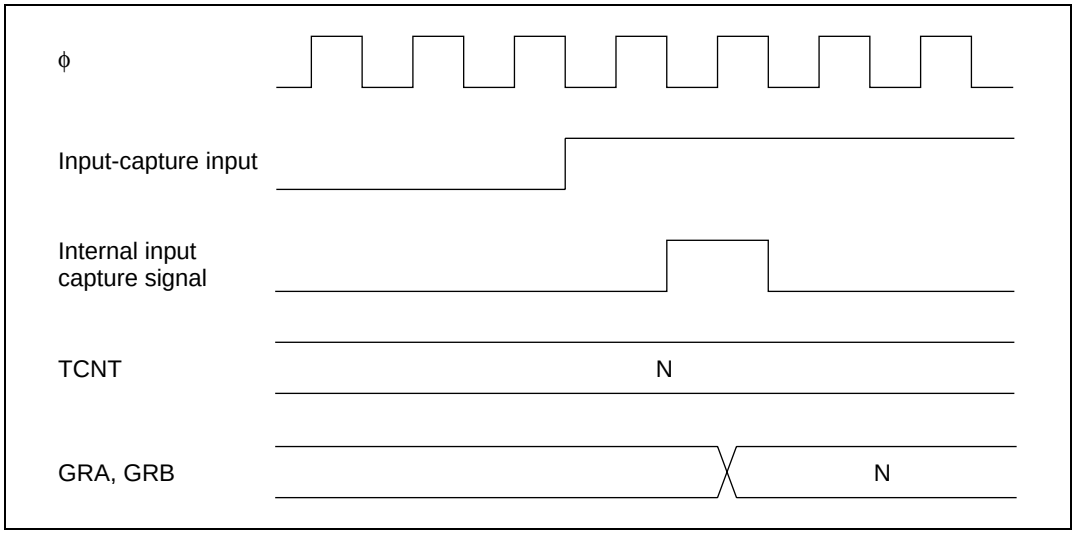

Figure 10.25 Input Capture Signal Timing

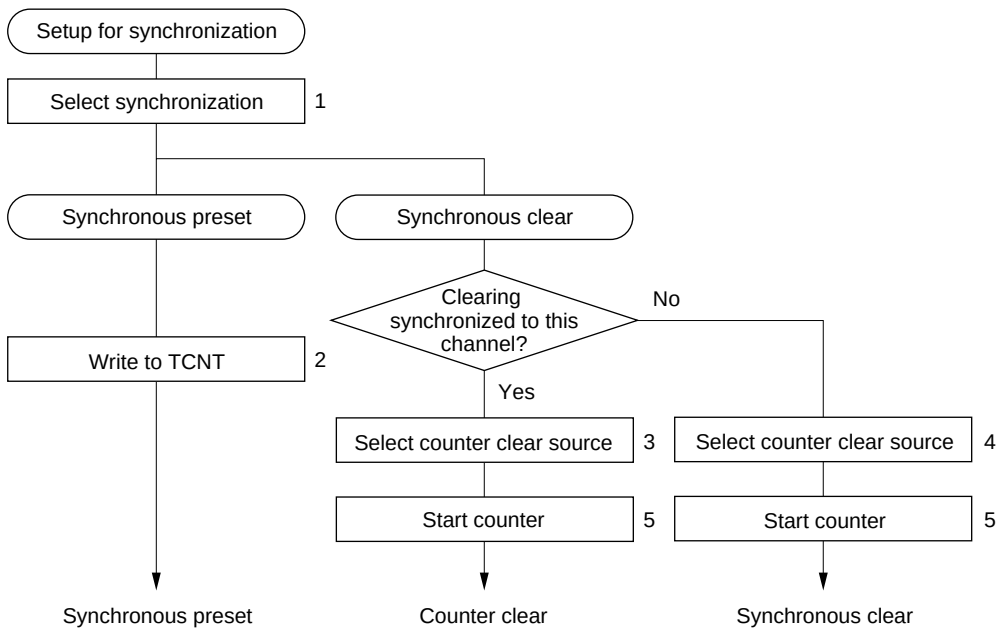
10.4.3 Synchronization

The synchronization function enables two or more timer counters to be synchronized by writing the same data to them simultaneously (synchronous preset). With appropriate TCR settings, two or more timer counters can also be cleared simultaneously (synchronous clear). Synchronization enables additional general registers to be associated with a single time base. Synchronization can be selected for all channels (0 to 4).

Sample Setup Procedure for Synchronization: Figure 10.26 shows a sample procedure for setting up synchronization.



1. Set the SYNC bits to 1 in TSNC for the channels to be synchronized.
2. When a value is written in TCNT in one of the synchronized channels, the same value is simultaneously written in TCNT in the other channels (synchronized preset).
3. Set the CCLR1 or CCLR0 bit in TCR to have the counter cleared by compare match or input capture.
4. Set the CCLR1 and CCLR0 bits in TCR to have the counter cleared synchronously.
5. Set the STR bits in TSTR to 1 to start the synchronized counters.

Figure 10.26 Setup Procedure for Synchronization (Example)

Example of Synchronization: Figure 10.27 shows an example of synchronization. Channels 0, 1, and 2 are synchronized, and are set to operate in PWM mode. Channel 0 is set for counter clearing by compare match with GRB0. Channels 1 and 2 are set for synchronous counter clearing. The timer counters in channels 0, 1, and 2 are synchronously preset, and are synchronously cleared by compare match with GRB0. A three-phase PWM waveform is output from pins $TIOCA_0$, $TIOCA_1$, and $TIOCA_2$. For further information on PWM mode, see section 10.4.4, PWM Mode.

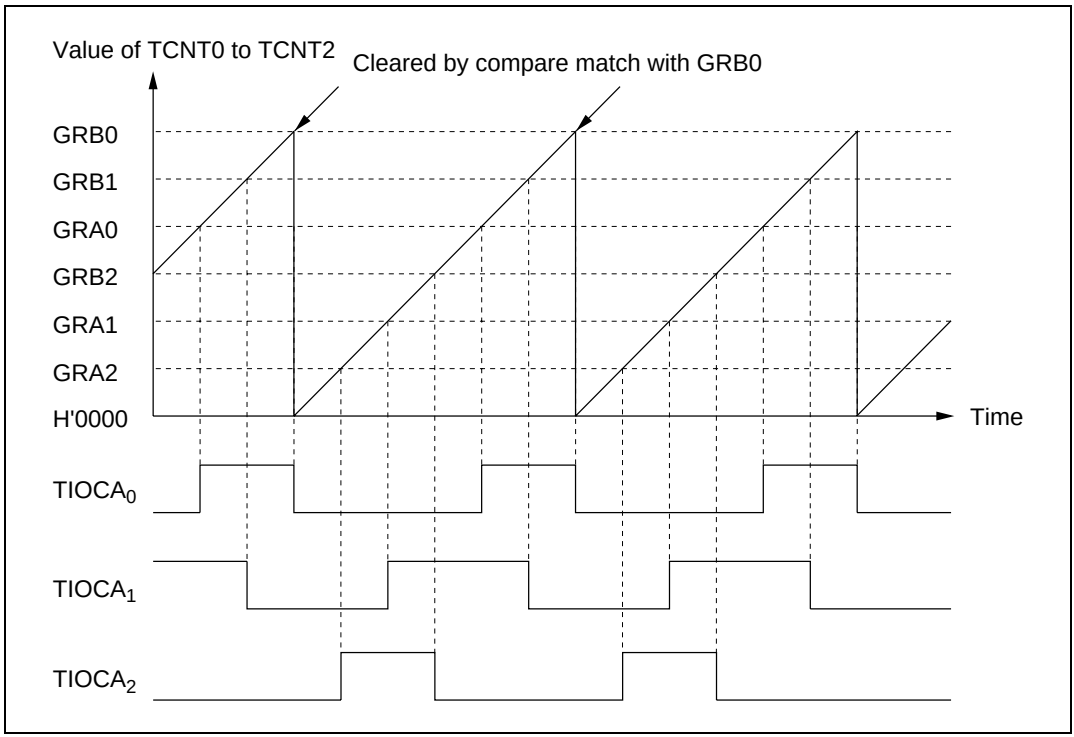


Figure 10.27 Synchronization (Example)

10.4.4 PWM Mode

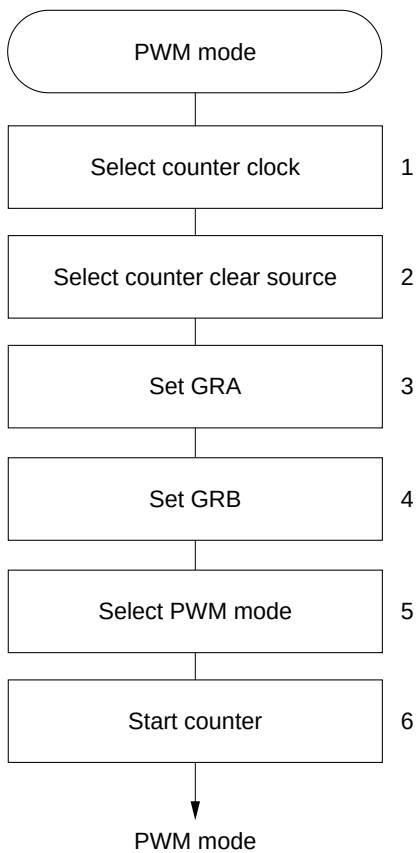
In PWM mode GRA and GRB are paired and a PWM waveform is output from the TIOCA pin. GRA specifies the time at which the PWM output changes to 1. GRB specifies the time at which the PWM output changes to 0. If either GRA or GRB is selected as the counter clear source, a PWM waveform with a duty cycle from 0% to 100% is output at the TIOCA pin. PWM mode can be selected in all channels (0 to 4).

Table 10.4 summarizes the PWM output pins and corresponding registers. If the same value is set in GRA and GRB, the output does not change when compare match occurs.

Table 10.4 PWM Output Pins and Registers

Channel	Output Pin	1 Output	0 Output
0	$TIOCA_0$	GRA0	GRB0
1	$TIOCA_1$	GRA1	GRB1
2	$TIOCA_2$	GRA2	GRB2
3	$TIOCA_3$	GRA3	GRB3
4	$TIOCA_4$	GRA4	GRB4

Sample Setup Procedure for PWM Mode: Figure 10.28 shows a sample procedure for setting up PWM mode.



1. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source. If an external clock source is selected, set bits CKEG1 and CKEG0 in TCR to select the desired edge(s) of the external clock signal.
2. Set bits CCLR1 and CCLR0 in TCR to select the counter clear source.
3. Set the time at which the PWM waveform should go to 1 in GRA.
4. Set the time at which the PWM waveform should go to 0 in GRB.
5. Set the PWM bit in TMDR to select PWM mode. When PWM mode is selected, regardless of the TIOR contents, GRA and GRB become output compare registers specifying the times at which the PWM output goes to 1 and 0. The TIOCA pin automatically becomes the PWM output pin. The TIOCB pin conforms to the settings of bits IOB1 and IOB0 in TIOR. If TIOCB output is not desired, clear both IOB1 and IOB0 to 0.
6. Set the STR bit to 1 in TSTR to start the timer counter.

Figure 10.28 Setup Procedure for PWM Mode (Example)

Examples of PWM Mode: Figure 10.29 shows examples of operation in PWM mode. In PWM mode TIOCA becomes an output pin. The output goes to 1 at compare match with GRA, and to 0 at compare match with GRB.

In the examples shown, TCNT is cleared by compare match with GRA or GRB. Synchronized operation and free-running counting are also possible.

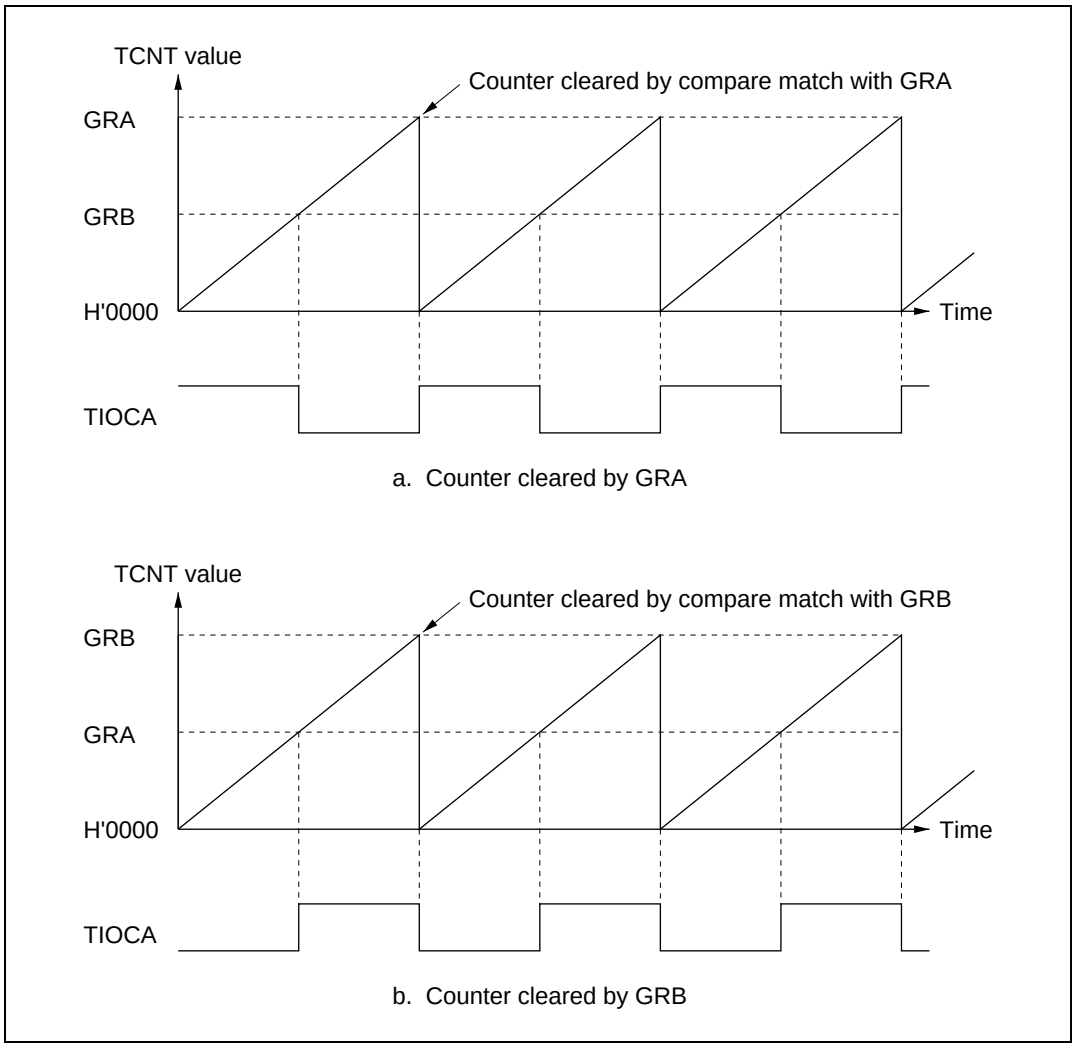


Figure 10.29 PWM Mode (Example 1)

Figure 10.30 shows examples of the output of PWM waveforms with duty cycles of 0% and 100%. If the counter is cleared by compare match with GRB, and GRA is set to a higher value than GRB, the duty cycle is 0%. If the counter is cleared by compare match with GRA, and GRB is set to a higher value than GRA, the duty cycle is 100%.

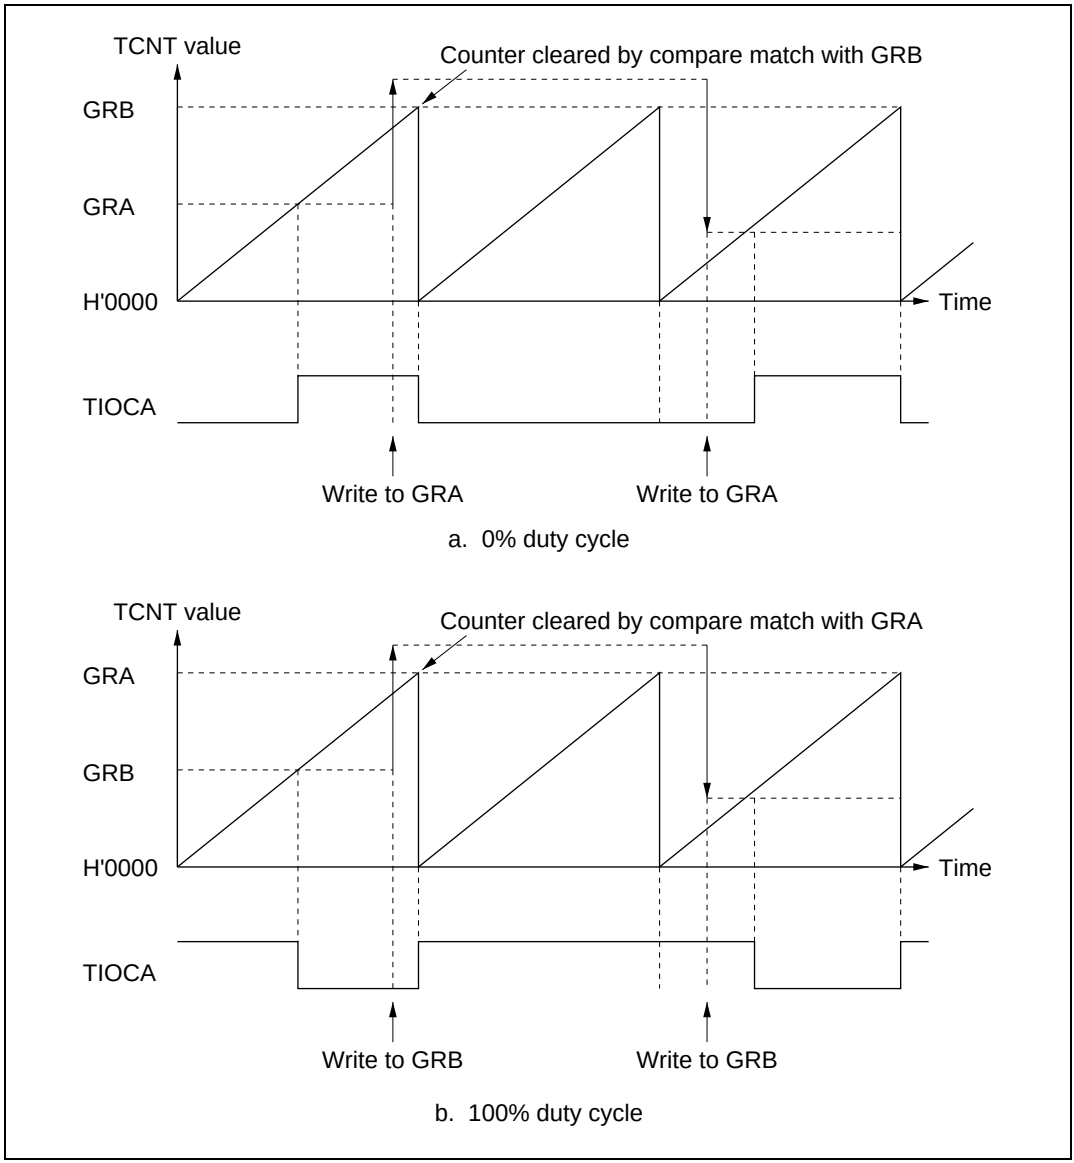

Figure 10.30 PWM Mode (Example 2)

10.4.5 Reset-Synchronized PWM Mode

In reset-synchronized PWM mode channels 3 and 4 are combined to produce three pairs of complementary PWM waveforms, all having one waveform transition point in common.

When reset-synchronized PWM mode is selected $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TOCXA_4$, $TIOCB_4$, and $TOCXB_4$ automatically become PWM output pins, and TCNT3 functions as an up-counter.

Table 10.5 lists the PWM output pins. Table 10.6 summarizes the register settings.

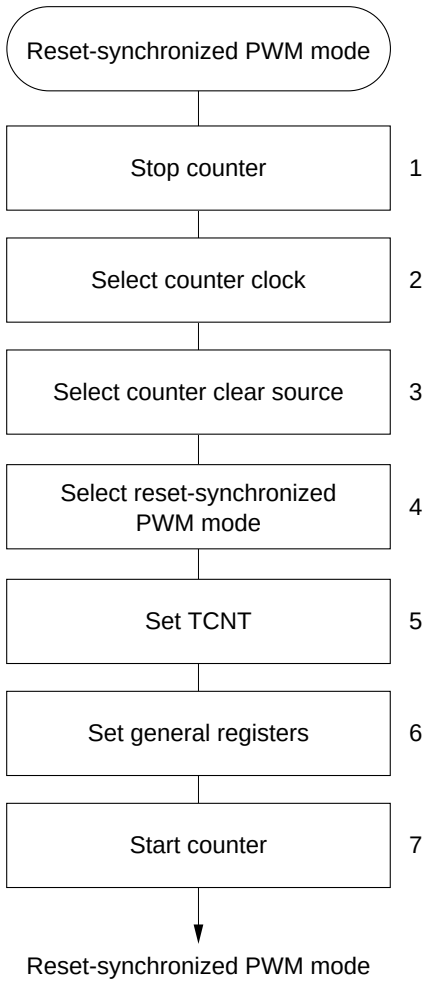
Table 10.5 Output Pins in Reset-Synchronized PWM Mode

Channel	Output Pin	Description
3	$TIOCA_3$	PWM output 1
	$TIOCB_3$	PWM output 1' (complementary waveform to PWM output 1)
4	$TIOCA_4$	PWM output 2
	$TOCXA_4$	PWM output 2' (complementary waveform to PWM output 2)
	$TIOCB_4$	PWM output 3
	$TOCXB_4$	PWM output 3' (complementary waveform to PWM output 3)

Table 10.6 Register Settings in Reset-Synchronized PWM Mode

Register	Setting
TCNT3	Initially set to H'0000
TCNT4	Not used (operates independently)
GRA3	Specifies the count period of TCNT3
GRB3	Specifies a transition point of PWM waveforms output from $TIOCA_3$ and $TIOCB_3$
GRA4	Specifies a transition point of PWM waveforms output from $TIOCA_4$ and $TOCXA_4$
GRB4	Specifies a transition point of PWM waveforms output from $TIOCB_4$ and $TOCXB_4$

Sample Setup Procedure for Reset-Synchronized PWM Mode: Figure 10.31 shows a sample procedure for setting up reset-synchronized PWM mode.



1. Clear the STR3 bit in TSTR to 0 to halt TCNT3. Reset-synchronized PWM mode must be set up while TCNT3 is halted.
2. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source for channel 3. If an external clock source is selected, select the external clock edge(s) with bits CKEG1 and CKEG0 in TCR.
3. Set bits CCLR1 and CCLR0 in TCR3 to select GRA3 compare match as the counter clear source.
4. Set bits CMD1 and CMD0 in TFCR to select reset-synchronized PWM mode. $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TIOCB_4$, $TOCXA_4$, and $TOCXB_4$ automatically become PWM output pins.
5. Preset TCNT3 to H'0000. TCNT4 need not be preset.
6. GRA3 is the waveform period register. Set the waveform period value in GRA3. Set transition times of the PWM output waveforms in GRB3, GRA4, and GRB4. Set times within the compare match range of TCNT3. $X \leq GRA3$ (X: setting value)
7. Set the STR3 bit in TSTR to 1 to start TCNT3.

Figure 10.31 Setup Procedure for Reset-Synchronized PWM Mode (Example)

Example of Reset-Synchronized PWM Mode: Figure 10.32 shows an example of operation in reset-synchronized PWM mode. TCNT3 operates as an up-counter in this mode. TCNT4 operates independently, detached from GRA4 and GRB4. When TCNT3 matches GRA3, TCNT3 is cleared and resumes counting from H'0000. The PWM outputs toggle at compare match of TCNT3 with GRB3, GRA4, and GRB4 respectively, and all toggle when the counter is cleared.

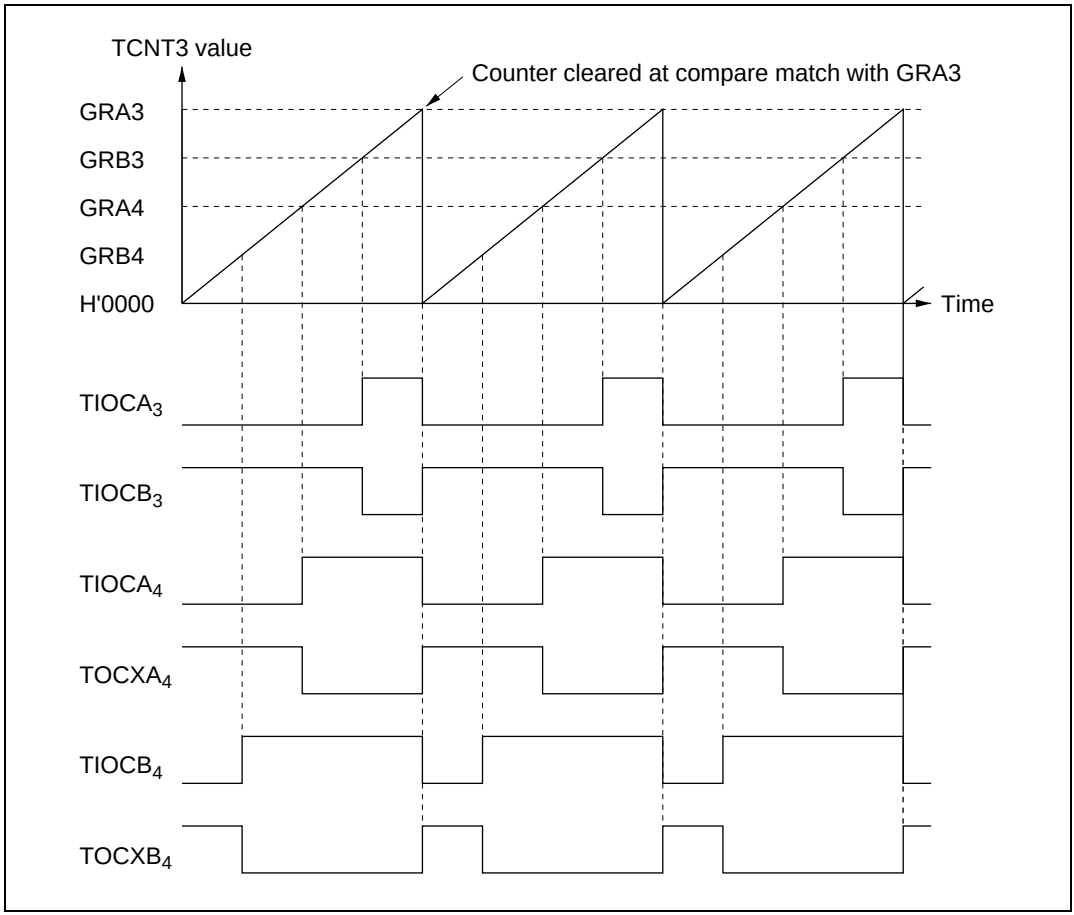


Figure 10.32 Operation in Reset-Synchronized PWM Mode (Example) (when OLS3 = OLS4 = 1)

For the settings and operation when reset-synchronized PWM mode and buffer mode are both selected, see section 10.4.8, Buffering.

10.4.6 Complementary PWM Mode

In complementary PWM mode channels 3 and 4 are combined to output three pairs of complementary, non-overlapping PWM waveforms.

When complementary PWM mode is selected $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TOCXA_4$, $TIOCB_4$, and $TOCXB_4$ automatically become PWM output pins, and TCNT3 and TCNT4 function as up/down-counters.

Table 10.7 lists the PWM output pins. Table 10.8 summarizes the register settings.

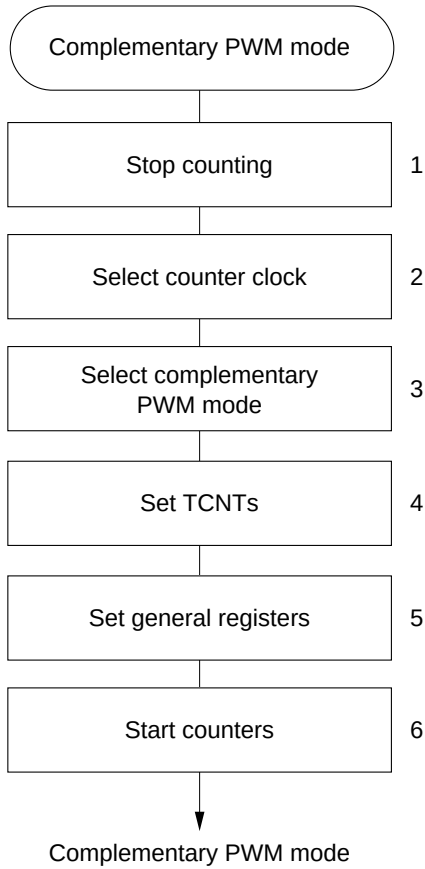
Table 10.7 Output Pins in Complementary PWM Mode

Channel	Output Pin	Description
3	$TIOCA_3$	PWM output 1
	$TIOCB_3$	PWM output 1' (non-overlapping complementary waveform to PWM output 1)
4	$TIOCA_4$	PWM output 2
	$TOCXA_4$	PWM output 2' (non-overlapping complementary waveform to PWM output 2)
	$TIOCB_4$	PWM output 3
	$TOCXB_4$	PWM output 3' (non-overlapping complementary waveform to PWM output 3)

Table 10.8 Register Settings in Complementary PWM Mode

Register	Setting
TCNT3	Initially specifies the non-overlap margin (difference to TCNT4)
TCNT4	Initially set to H'0000
GRA3	Specifies the upper limit value of TCNT3 minus 1
GRB3	Specifies a transition point of PWM waveforms output from $TIOCA_3$ and $TIOCB_3$
GRA4	Specifies a transition point of PWM waveforms output from $TIOCA_4$ and $TOCXA_4$
GRB4	Specifies a transition point of PWM waveforms output from $TIOCB_4$ and $TOCXB_4$

Setup Procedure for Complementary PWM Mode: Figure 10.33 shows a sample procedure for setting up complementary PWM mode.



1. Clear bits STR3 and STR4 to 0 in TSTR to halt the timer counters. Complementary PWM mode must be set up while TCNT3 and TCNT4 are halted.
2. Set bits TPSC2 to TPSC0 in TCR to select the same counter clock source for channels 3 and 4. If an external clock source is selected, select the external clock edge(s) with bits CKEG1 and CKEG0 in TCR. Do not select any counter clear source with bits CCLR1 and CCLR0 in TCR.
3. Set bits CMD1 and CMD0 in TFCR to select complementary PWM mode. $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TIOCB_4$, $TOCXA_4$, and $TOCXB_4$ automatically become PWM output pins.
4. Clear TCNT4 to H'0000. Set the non-overlap margin in TCNT3. Do not set TCNT3 and TCNT4 to the same value.
5. GRA3 is the waveform period register. Set the upper limit value of TCNT3 minus 1 in GRA3. Set transition times of the PWM output waveforms in GRB3, GRA4, and GRB4. Set times within the compare match range of TCNT3 and TCNT4. $T \leq X$ (X: initial setting of GRB3, GRA4, or GRB4. T: initial setting of TCNT3)
6. Set bits STR3 and STR4 in TSTR to 1 to start TCNT3 and TCNT4.

Note: After exiting complementary PWM mode, to resume operating in complementary PWM mode, follow the entire setup procedure from step 1 again.

Figure 10.33 Setup Procedure for Complementary PWM Mode (Example)

Clearing Procedure for Complementary PWM Mode: Figure 10.34 shows the steps to clear complementary PWM mode.

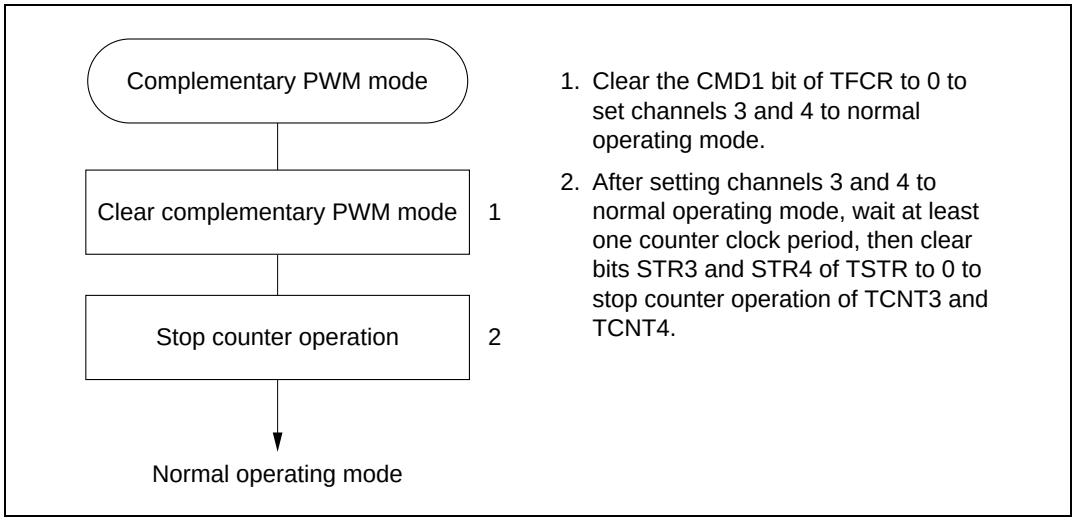


Figure 10.34 Clearing Procedure for Complementary PWM Mode

Examples of Complementary PWM Mode: Figure 10.35 shows an example of operation in complementary PWM mode. TCNT3 and TCNT4 operate as up/down-counters, counting down from compare match between TCNT3 and GRA3 and counting up from the point at which TCNT4 underflows. During each up-and-down counting cycle, PWM waveforms are generated by compare match with general registers GRB3, GRA4, and GRB4. Since TCNT3 is initially set to a higher value than TCNT4, compare match events occur in the sequence TCNT3, TCNT4, TCNT4, TCNT3.

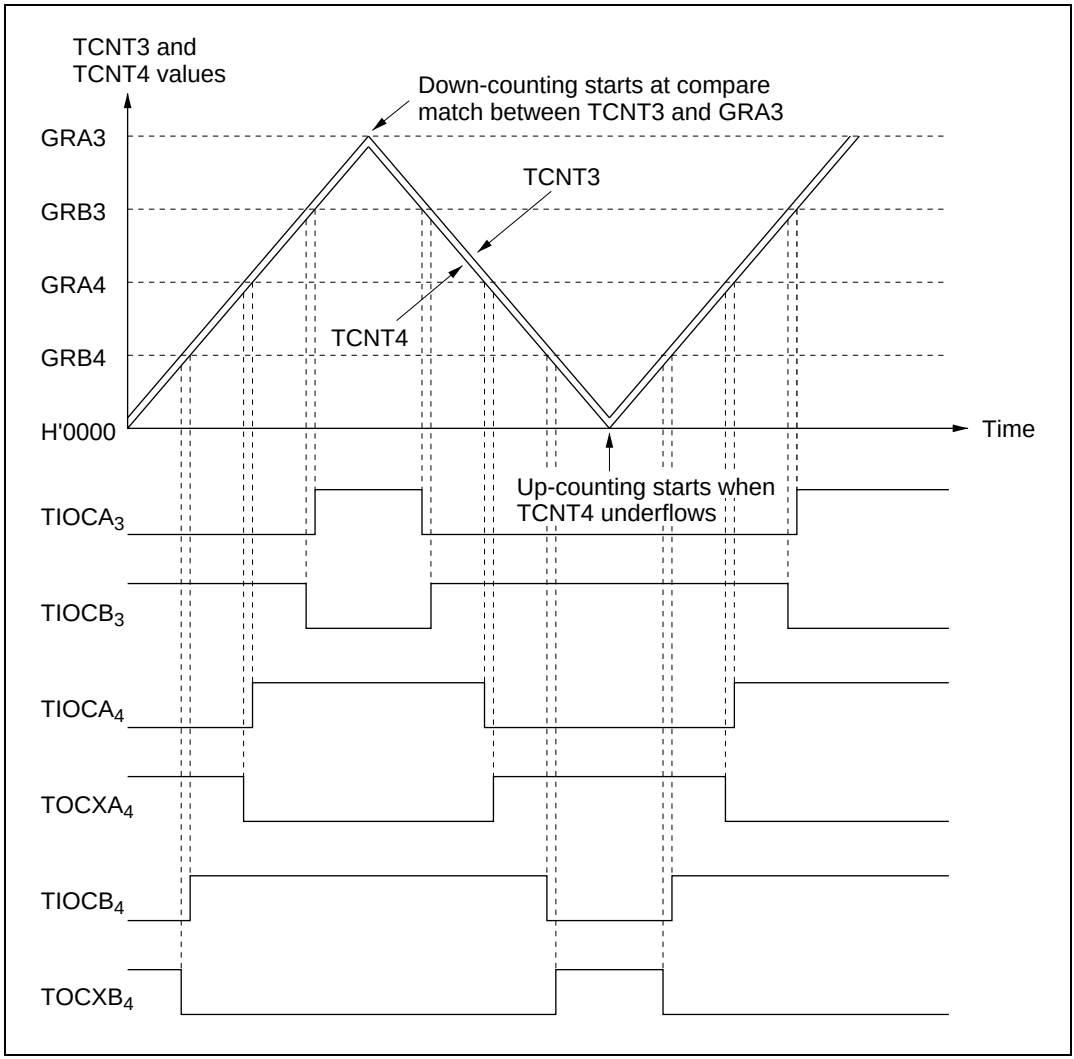

Figure 10.35 Operation in Complementary PWM Mode (Example 1, OLS3 = OLS4 = 1)

Figure 10.36 shows examples of waveforms with 0% and 100% duty cycles (in one phase) in complementary PWM mode. In this example the outputs change at compare match with GRB3, so waveforms with duty cycles of 0% or 100% can be output by setting GRB3 to a value larger than GRA3. The duty cycle can be changed easily during operation by use of the buffer registers. For further information see section 10.4.8, Buffering.

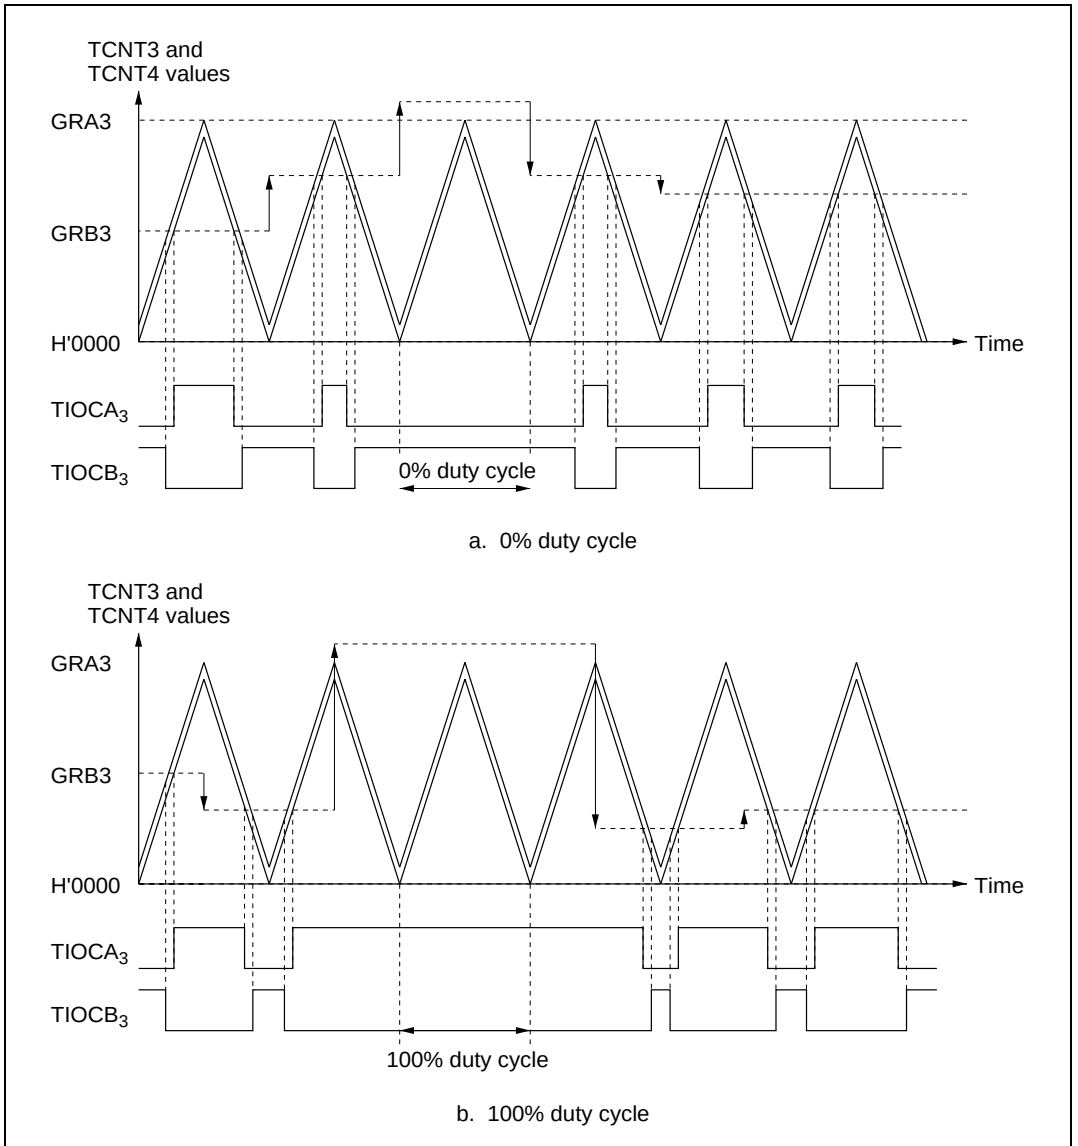

Figure 10.36 Operation in Complementary PWM Mode (Example 2, OLS3 = OLS4 = 1)

In complementary PWM mode, TCNT3 and TCNT4 overshoot and undershoot at the transitions between up-counting and down-counting. The setting conditions for the IMFA bit in channel 3 and the OVF bit in channel 4 differ from the usual conditions. In buffered operation the buffer transfer conditions also differ. Timing diagrams are shown in figures 10.37 and 10.38.

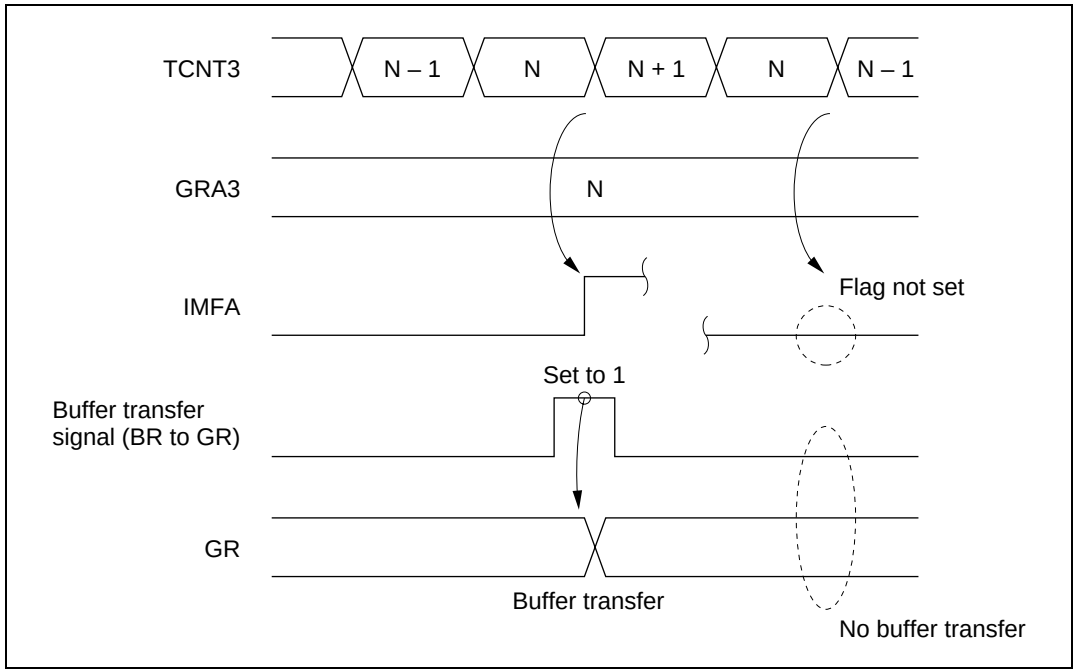

Figure 10.37 Overshoot Timing

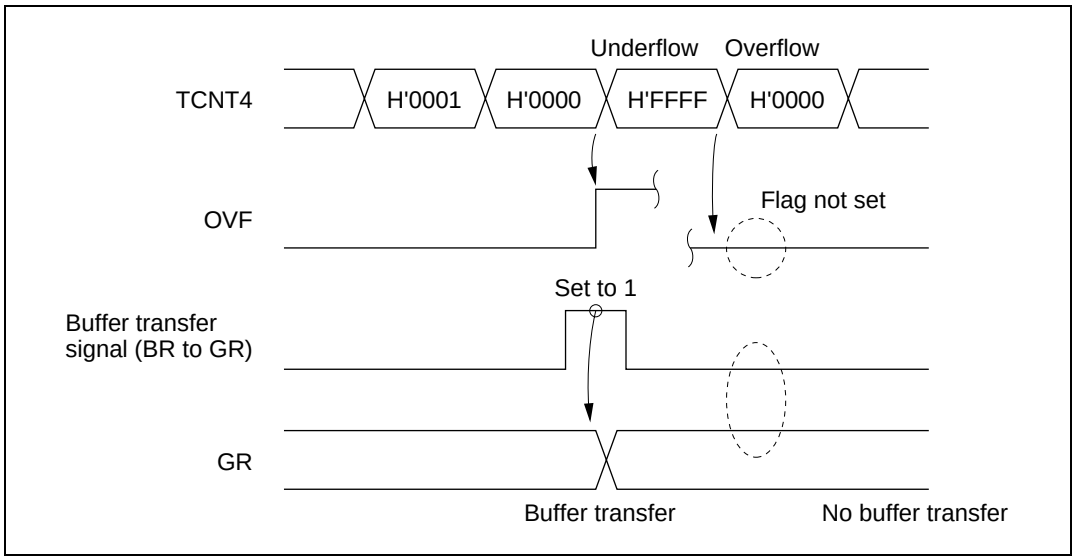

Figure 10.38 Undershoot Timing

In channel 3, IMFA is set to 1 only during up-counting. In channel 4, OVF is set to 1 only when an underflow occurs. When buffering is selected, buffer register contents are transferred to the general register at compare match A3 during up-counting, and when TCNT4 underflows.

General Register Settings in Complementary PWM Mode: When setting up general registers for complementary PWM mode or changing their settings during operation, note the following points.

- Initial settings

  Do not set values from H'0000 to T – 1 (where T is the initial value of TCNT3). After the counters start and the first compare match A3 event has occurred, however, settings in this range also become possible.
- Changing settings

  Use the buffer registers. Correct waveform output may not be obtained if a general register is written to directly.
- Cautions on changes of general register settings

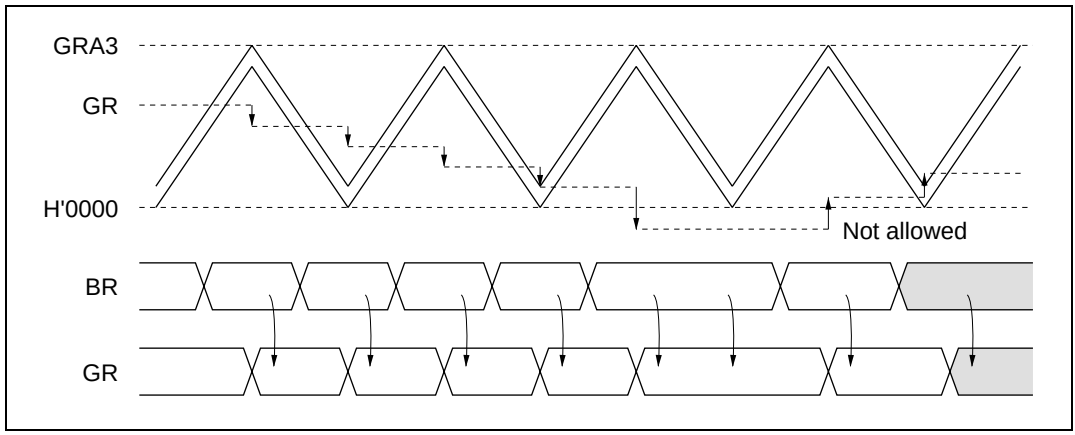

Figure 10.39 Changing a General Register Setting by Buffer Transfer (Example 1)

— Buffer transfer at transition from up-counting to down-counting

If the general register value is in the range from GRA3 – T + 1 to GRA3, do not transfer a buffer register value outside this range. Conversely, if the general register value is outside this range, do not transfer a value within this range. See figure 10.40.

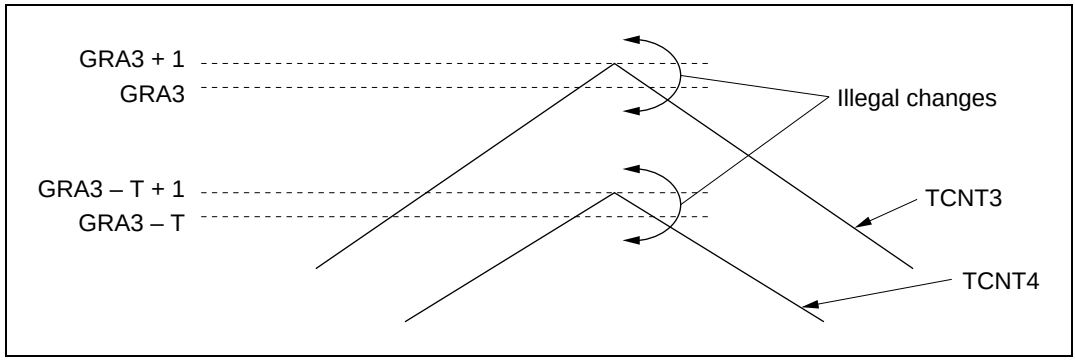

Figure 10.40 Changing a General Register Setting by Buffer Transfer (Caution 1)

— Buffer transfer at transition from down-counting to up-counting

If the general register value is in the range from H'0000 to T – 1, do not transfer a buffer register value outside this range. Conversely, when a general register value is outside this range, do not transfer a value within this range. See figure 10.41.

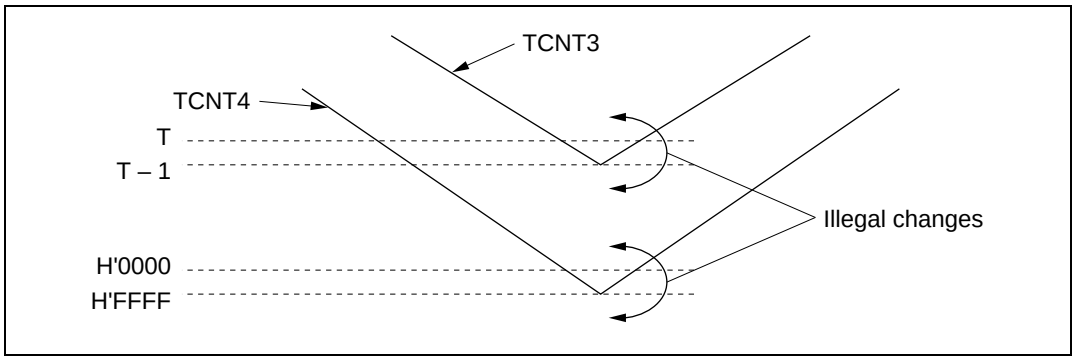

Figure 10.41 Changing a General Register Setting by Buffer Transfer (Caution 2)

— General register settings outside the counting range (H'0000 to GRA3)

Waveforms with a duty cycle of 0% or 100% can be output by setting a general register to a value outside the counting range. When a buffer register is set to a value outside the counting range, then later restored to a value within the counting range, the counting direction (up or down) must be the same both times.

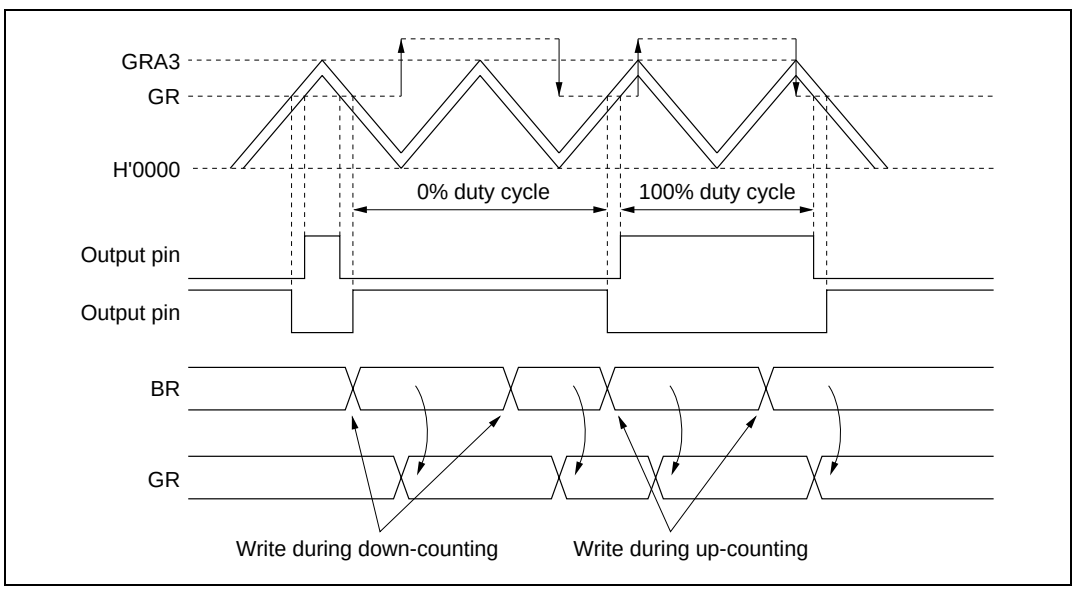

Figure 10.42 Changing a General Register Setting by Buffer Transfer (Example 2)

Settings can be made in this way by detecting GRA3 compare match or TCNT4 underflow before writing to the buffer register. They can also be made by using GRA3 compare match to activate the DMAC.

10.4.7 Phase Counting Mode

In phase counting mode the phase difference between two external clock inputs (at the TCLKA and TCLKB pins) is detected, and TCNT2 counts up or down accordingly.

In phase counting mode, the TCLKA and TCLKB pins automatically function as external clock input pins and TCNT2 becomes an up/down-counter, regardless of the settings of bits TPSC2 to TPSC0, CKEG1, and CKEG0 in TCR2. Settings of bits CCLR1, CCLR0 in TCR2, and settings in TIOR2, TIER2, TSR2, GRA2, and GRB2 are valid. The input capture and output compare functions can be used, and interrupts can be generated.

Phase counting is available only in channel 2.

Sample Setup Procedure for Phase Counting Mode: Figure 10.43 shows a sample procedure for setting up phase counting mode.

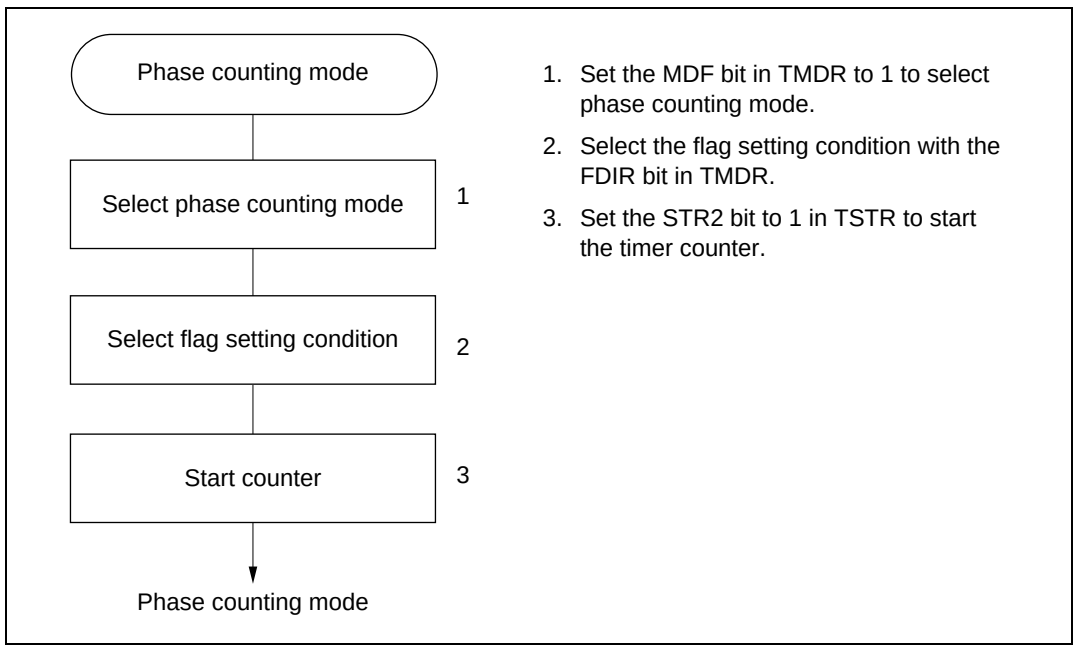

Figure 10.43 Setup Procedure for Phase Counting Mode (Example)

Example of Phase Counting Mode: Figure 10.44 shows an example of operations in phase counting mode. Table 10.9 lists the up-counting and down-counting conditions for TCNT2.

In phase counting mode both the rising and falling edges of TCLKA and TCLKB are counted. The phase difference between TCLKA and TCLKB must be at least 1.5 states, the phase overlap must also be at least 1.5 states, and the pulse width must be at least 2.5 states.

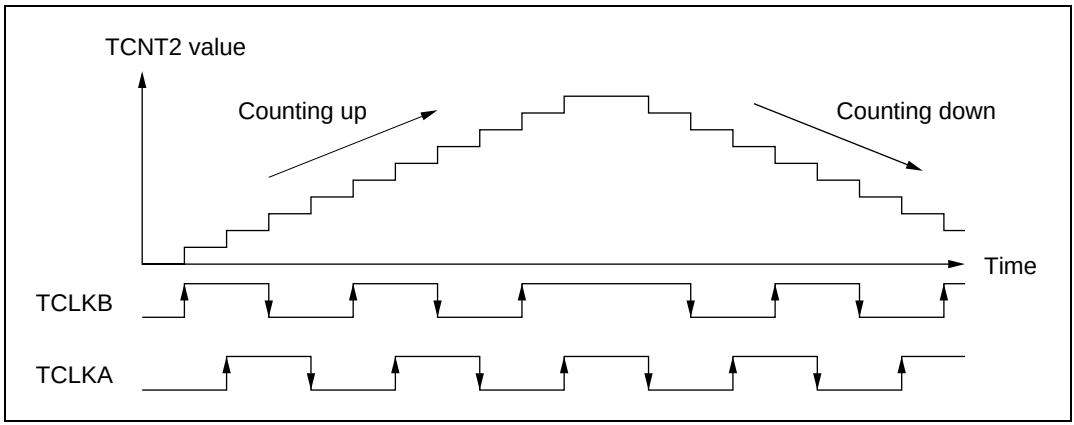

Figure 10.44 Operation in Phase Counting Mode (Example)

Table 10.9 Up/Down Counting Conditions

Counting Direction	Up-Counting				Down-Counting			
TCLKB	↑	High	↓	Low	High	↓	Low	↑
TCLKA	Low	↑	High	↓	↓	Low	↑	High

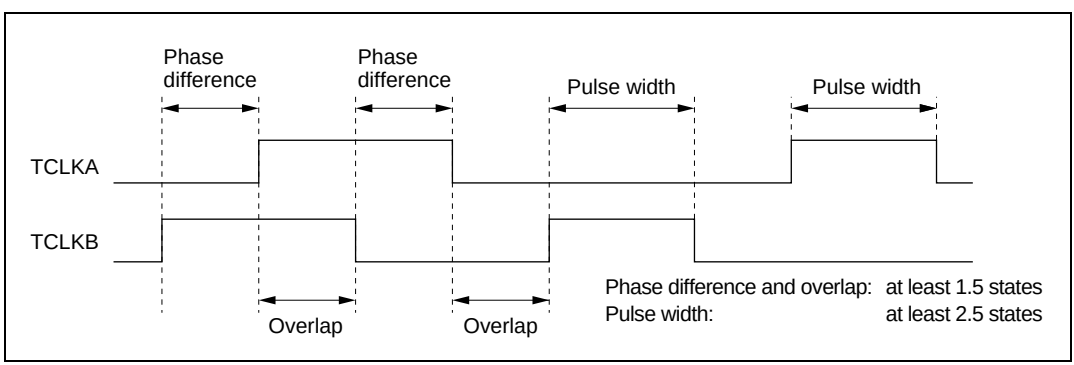

Figure 10.45 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

10.4.8 Buffering

Buffering operates differently depending on whether a general register is an output compare register or an input capture register, with further differences in reset-synchronized PWM mode and complementary PWM mode. Buffering is available only in channels 3 and 4. Buffering operations under the conditions mentioned above are described next.

- General register used for output compare

  The buffer register value is transferred to the general register at compare match.

  See figure 10.46.

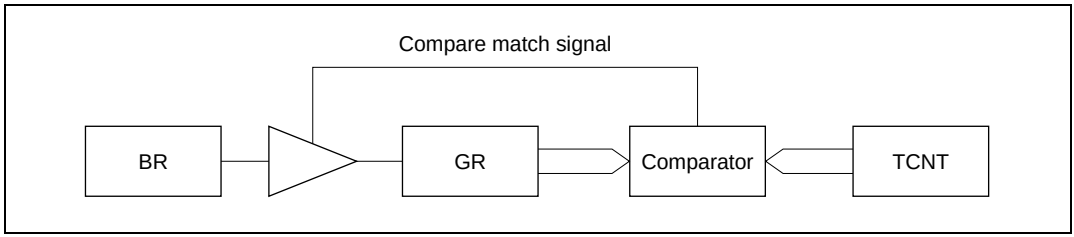

Figure 10.46 Compare Match Buffering

- General register used for input capture

  The TCNT value is transferred to the general register at input capture. The previous general register value is transferred to the buffer register.

  See figure 10.47.

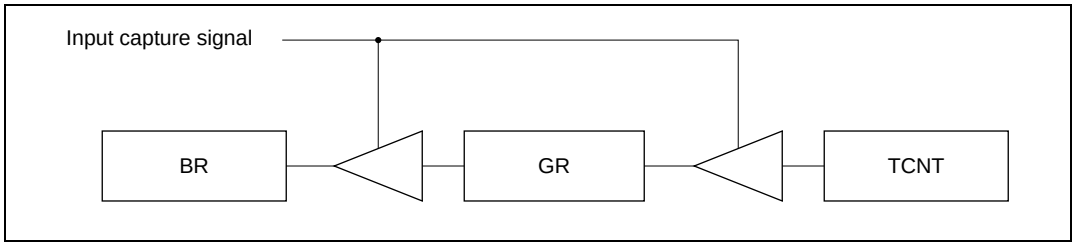

Figure 10.47 Input Capture Buffering

- Complementary PWM mode

  The buffer register value is transferred to the general register when TCNT3 and TCNT4 change counting direction. This occurs at the following two times:

  — When TCNT3 compare matches GRA3

  — When TCNT4 underflows
- Reset-synchronized PWM mode

  The buffer register value is transferred to the general register at compare match A3.

Sample Buffering Setup Procedure: Figure 10.48 shows a sample buffering setup procedure.

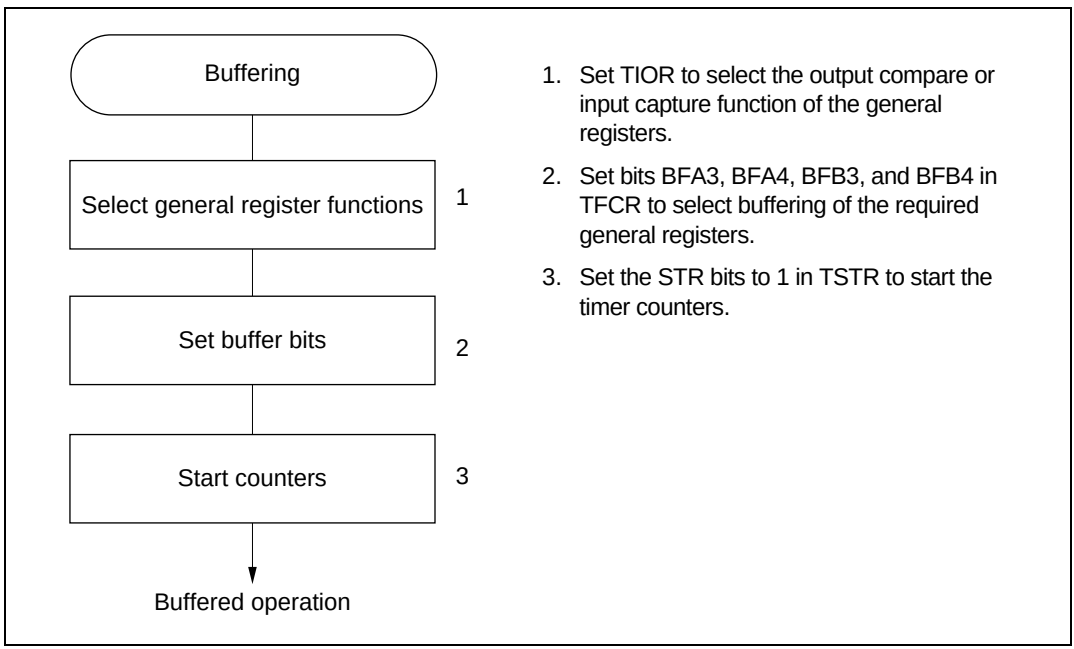

Figure 10.48 Buffering Setup Procedure (Example)

Examples of Buffering: Figure 10.49 shows an example in which GRA is set to function as an output compare register buffered by BRA, TCNT is set to operate as a periodic counter cleared by GRB compare match, and TIOCA and TIOCB are set to toggle at compare match A and B. Because of the buffer setting, when TIOCA toggles at compare match A, the BRA value is simultaneously transferred to GRA. This operation is repeated each time compare match A occurs. Figure 10.50 shows the transfer timing.

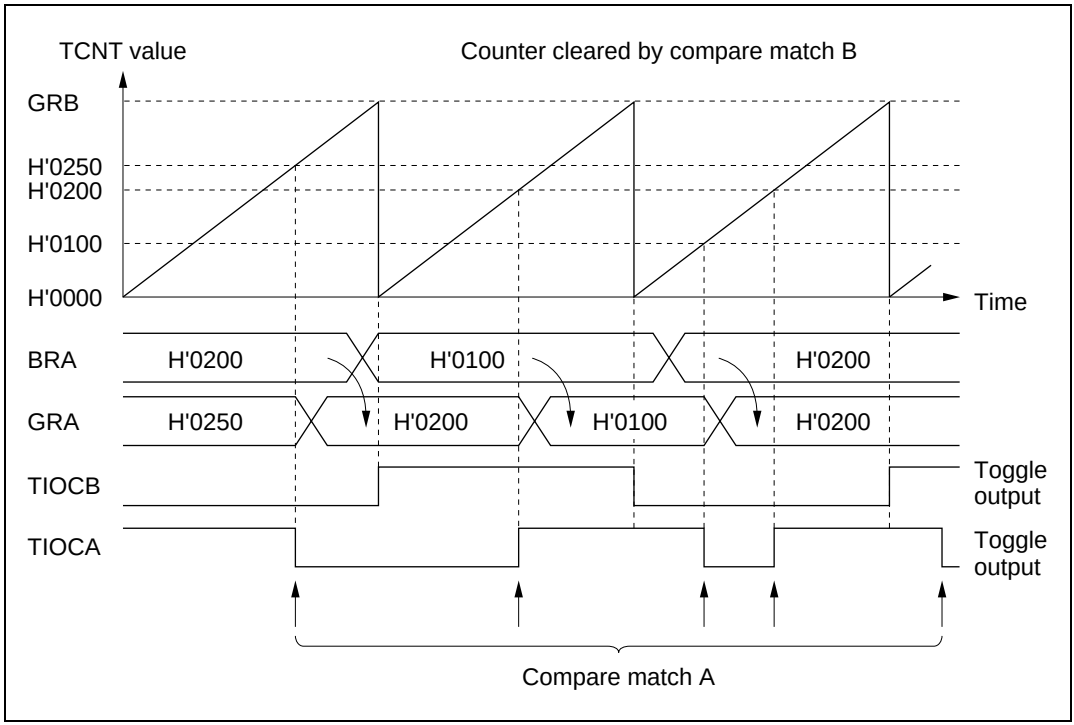

Figure 10.49 Register Buffering (Example 1: Buffering of Output Compare Register)

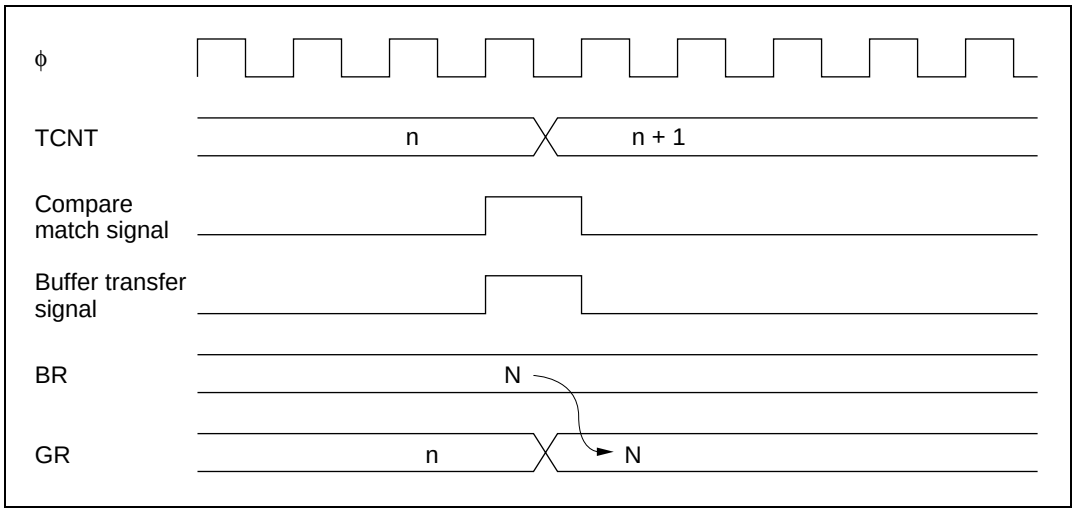

Figure 10.50 Compare Match and Buffer Transfer Timing (Example)

Figure 10.51 shows an example in which GRA is set to function as an input capture register buffered by BRA, and TCNT is cleared by input capture B. The falling edge is selected as the input capture edge at TIOCB. Both edges are selected as input capture edges at TIOCA. Because of the buffer setting, when the TCNT value is captured into GRA at input capture A, the previous GRA value is simultaneously transferred to BRA. Figure 10.52 shows the transfer timing.

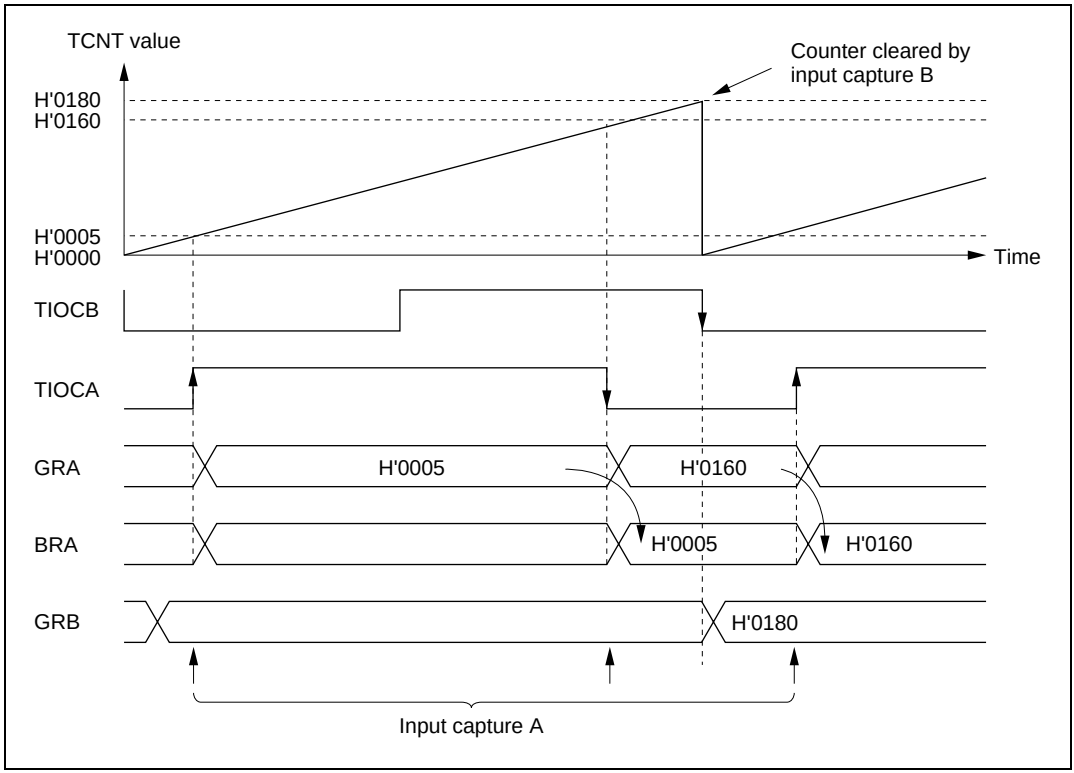

Figure 10.51 Register Buffering (Example 2: Buffering of Input Capture Register)

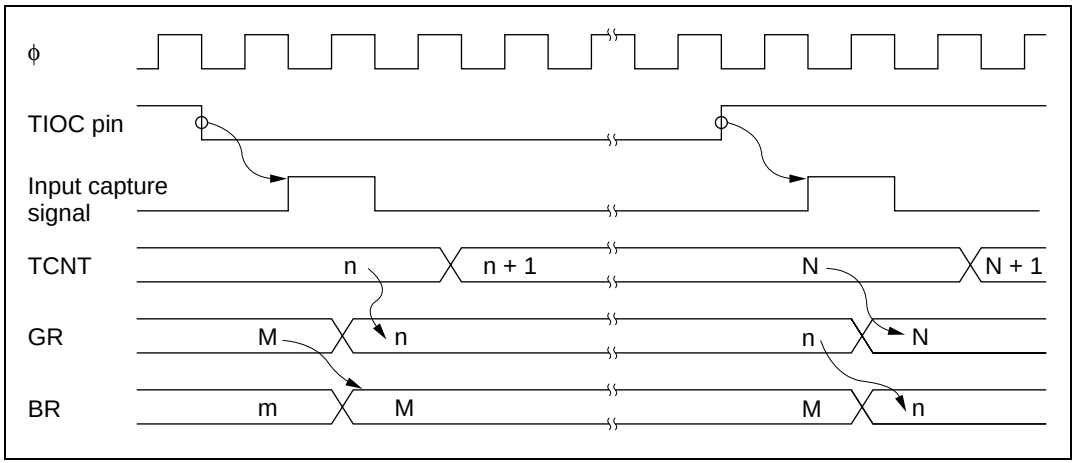

Figure 10.52 Input Capture and Buffer Transfer Timing

Figure 10.53 shows an example in which GRB3 is buffered by BRB3 in complementary PWM mode. Buffering is used to set GRB3 to a higher value than GRA3, generating a PWM waveform with 0% duty cycle. The BRB3 value is transferred to GRB3 when TCNT3 matches GRA3, and when TCNT4 underflows.

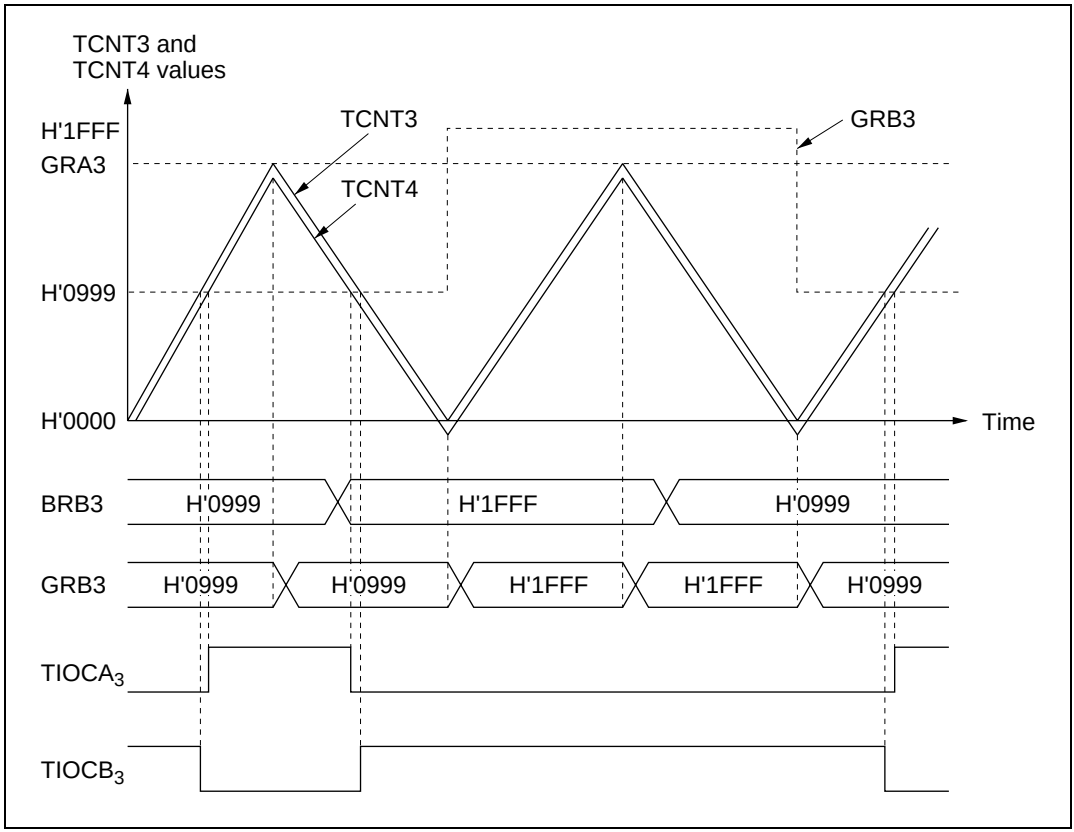

Figure 10.53 Register Buffering (Example 3: Buffering in Complementary PWM Mode)

10.4.9 ITU Output Timing

The ITU outputs from channels 3 and 4 can be disabled by bit settings in TOER or by an external trigger, or inverted by bit settings in TOCR.

Timing of Enabling and Disabling of ITU Output by TOER: In this example an ITU output is disabled by clearing a master enable bit to 0 in TOER. An arbitrary value can be output by appropriate settings of the data register (DR) and data direction register (DDR) of the corresponding input/output port. Figure 10.54 illustrates the timing of the enabling and disabling of ITU output by TOER.

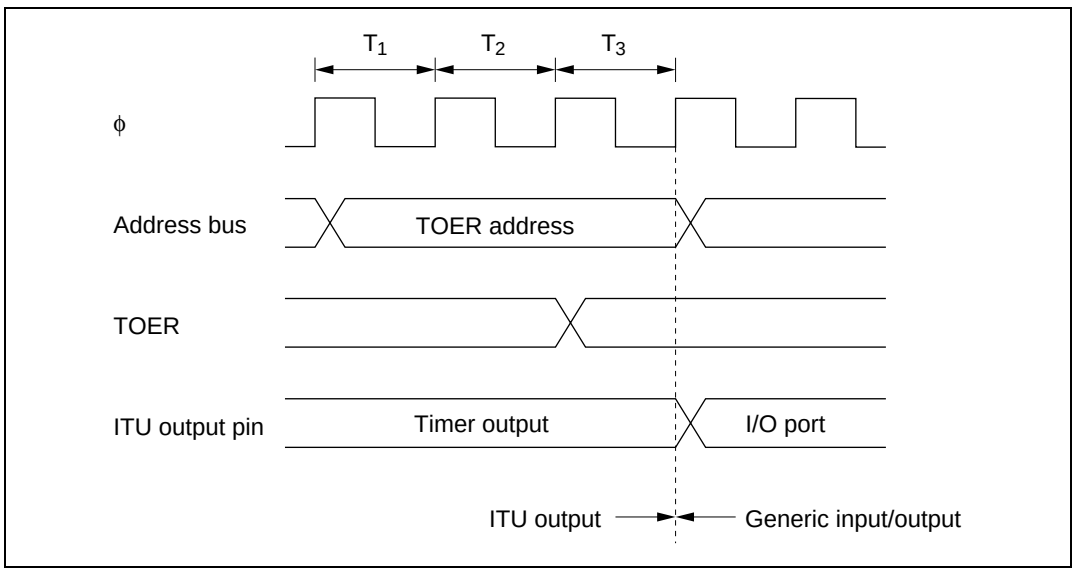

Figure 10.54 Timing of Disabling of ITU Output by Writing to TOER (Example)

Timing of Disabling of ITU Output by External Trigger: If the XTGD bit is cleared to 0 in TOCR in reset-synchronized PWM mode or complementary PWM mode, when an input capture A signal occurs in channel 1, the master enable bits are cleared to 0 in TOER, disabling ITU output. Figure 10.55 shows the timing.

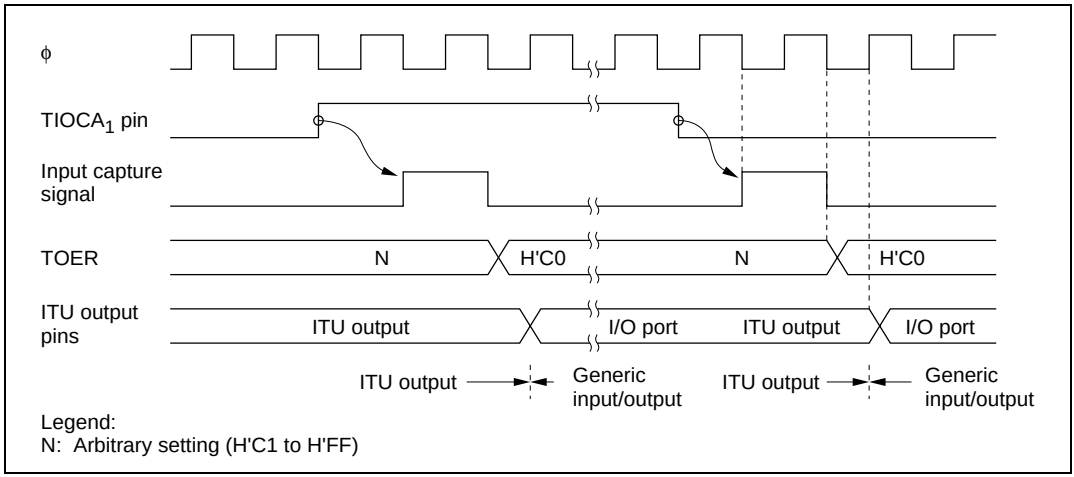

Figure 10.55 Timing of Disabling of ITU Output by External Trigger (Example)

Timing of Output Inversion by TOCR: The output levels in reset-synchronized PWM mode and complementary PWM mode can be inverted by inverting the output level select bits (OLS4 and OLS3) in TOCR. Figure 10.56 shows the timing.

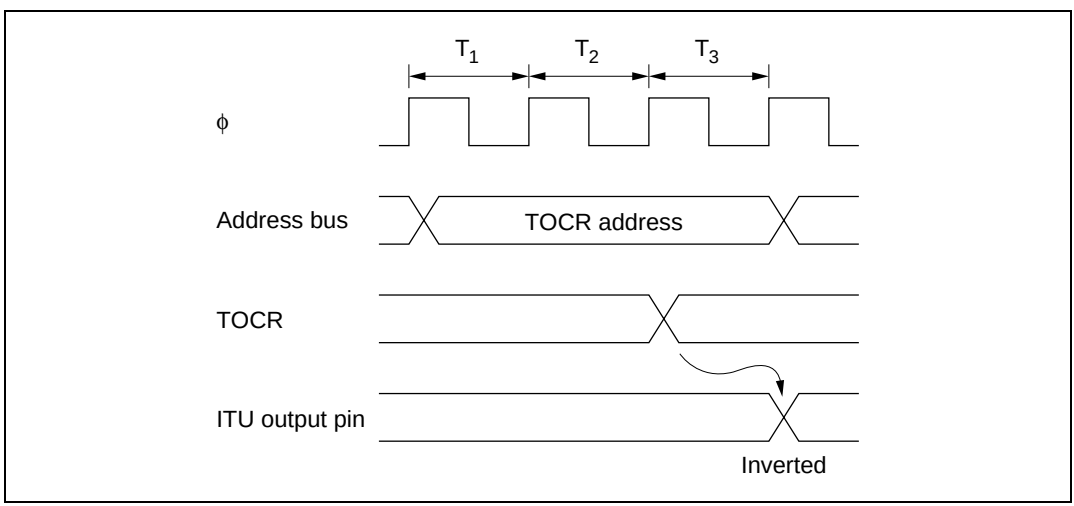

Figure 10.56 Timing of Inverting of ITU Output Level by Writing to TOCR (Example)

10.5 Interrupts

The ITU has two types of interrupts: input capture/compare match interrupts, and overflow interrupts.

10.5.1 Setting of Status Flags

Timing of Setting of IMFA and IMFB at Compare Match: IMFA and IMFB are set to 1 by a compare match signal generated when TCNT matches a general register (GR). The compare match signal is generated in the last state in which the values match (when TCNT is updated from the matching count to the next count). Therefore, when TCNT matches a general register, the compare match signal is not generated until the next timer clock input. Figure 10.57 shows the timing of the setting of IMFA and IMFB.

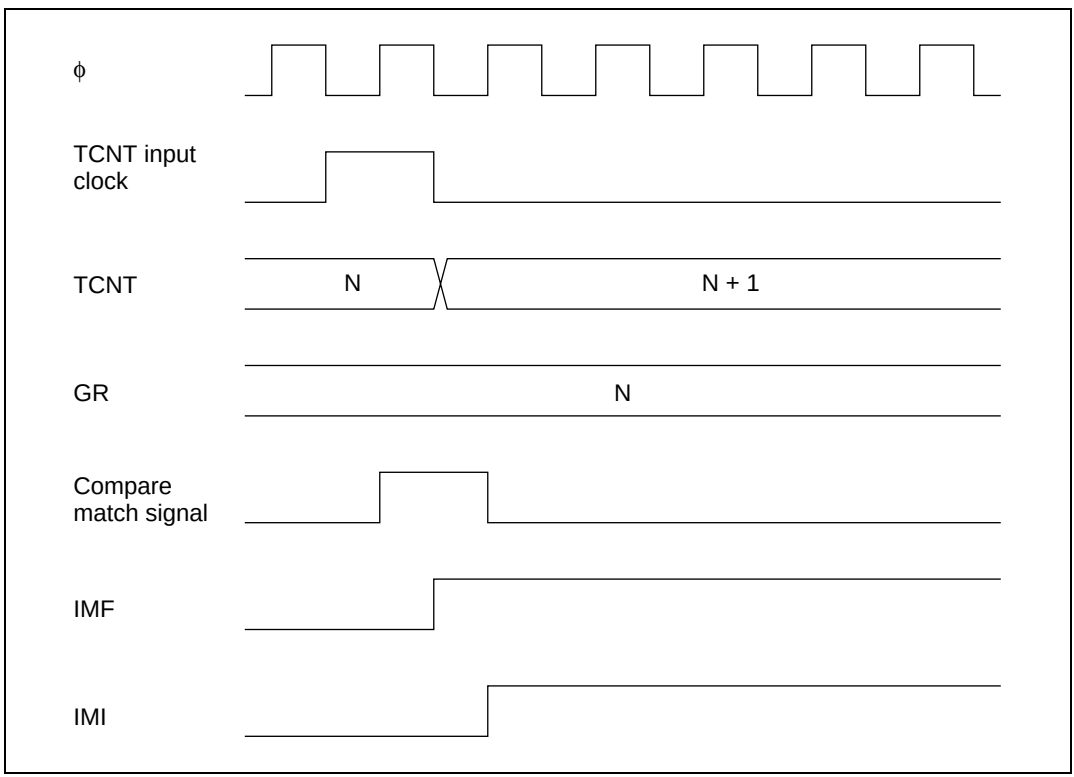

Figure 10.57 Timing of Setting of IMFA and IMFB by Compare Match

Timing of Setting of IMFA and IMFB by Input Capture: IMFA and IMFB are set to 1 by an input capture signal. The TCNT contents are simultaneously transferred to the corresponding general register. Figure 10.58 shows the timing.

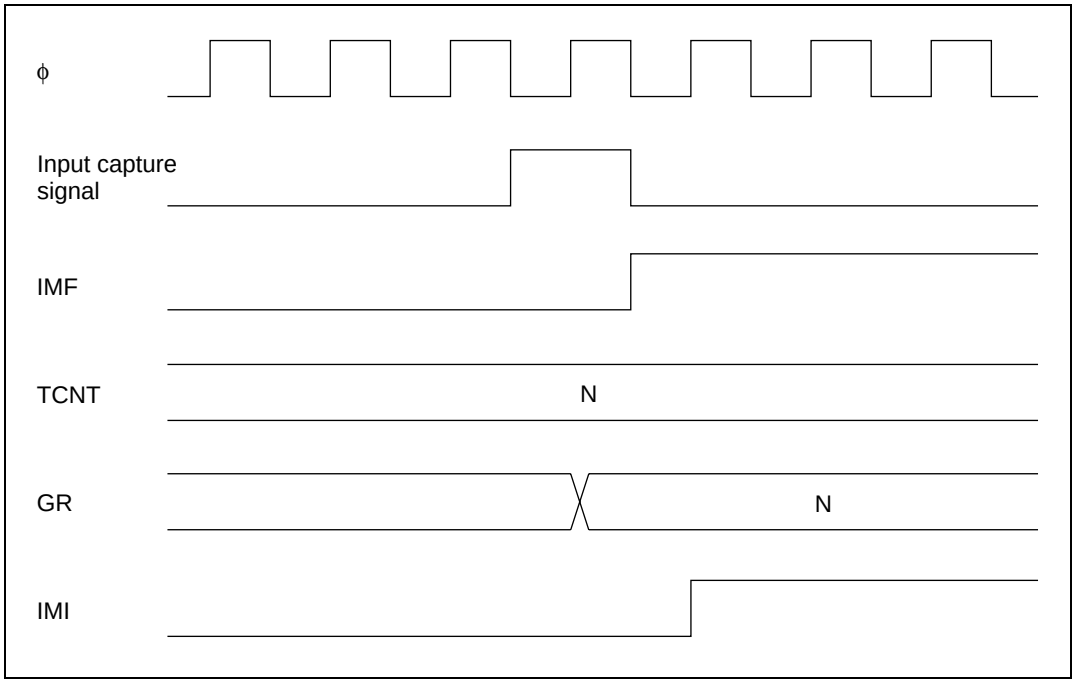

Figure 10.58 Timing of Setting of IMFA and IMFB by Input Capture

Timing of Setting of Overflow Flag (OVF): OVF is set to 1 when TCNT overflows from H'FFFF to H'0000 or underflows from H'0000 to H'FFFF. Figure 10.59 shows the timing.

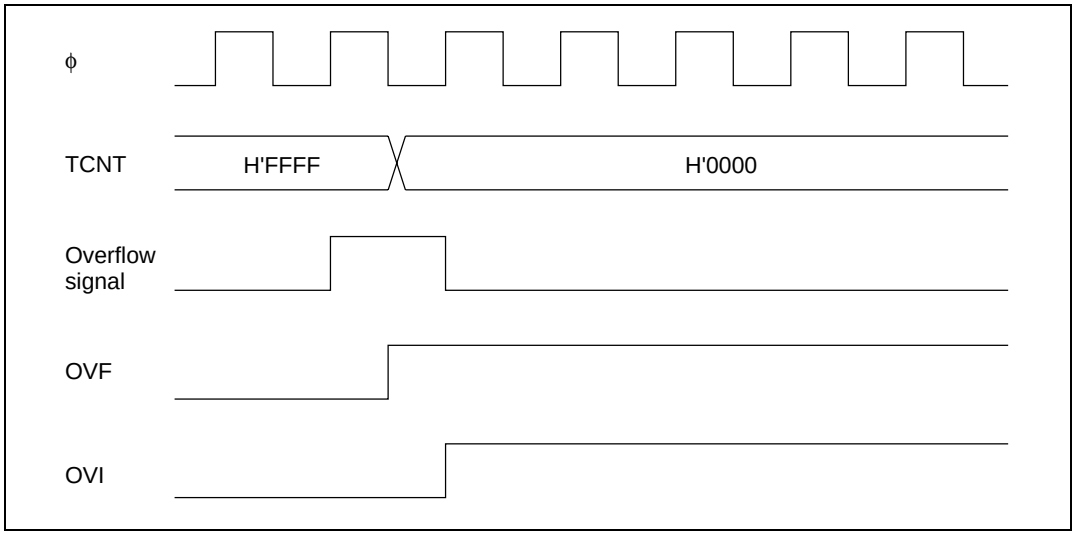

Figure 10.59 Timing of Setting of OVF

10.5.2 Clearing of Status Flags

If the CPU reads a status flag while it is set to 1, then writes 0 in the status flag, the status flag is cleared. Figure 10.60 shows the timing.

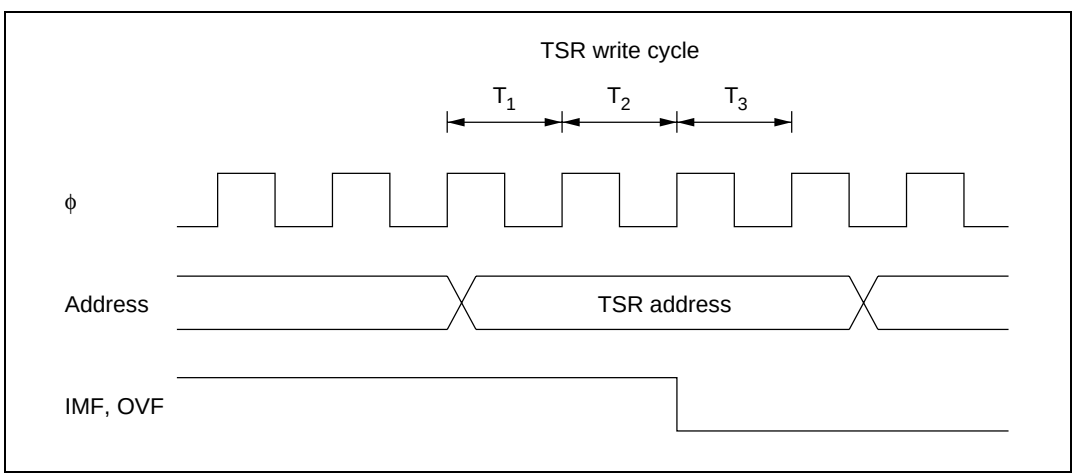

Figure 10.60 Timing of Clearing of Status Flags

10.5.3 Interrupt Sources and DMA Controller Activation

Each ITU channel can generate a compare match/input capture A interrupt, a compare match/input capture B interrupt, and an overflow interrupt. In total there are 15 interrupt sources, all independently vectored. An interrupt is requested when the interrupt request flag and interrupt enable bit are both set to 1.

The priority order of the channels can be modified in interrupt priority registers A and B (IPRA and IPRB). For details see section 5, Interrupt Controller.

Compare match/input capture A interrupts in channels 0 to 3 can activate the DMA controller (DMAC). When the DMAC is activated a CPU interrupt is not requested.

Table 10.10 lists the interrupt sources.

Table 10.10 ITU Interrupt Sources

Channel	Interrupt Source	Description	DMAC Activatable	Priority*
0	IMIA0	Compare match/input capture A0	Yes	High
	IMIB0	Compare match/input capture B0	No	
	OVI0	Overflow 0	No	
1	IMIA1	Compare match/input capture A1	Yes	
	IMIB1	Compare match/input capture B1	No	
	OVI1	Overflow 1	No	
2	IMIA2	Compare match/input capture A2	Yes	
	IMIB2	Compare match/input capture B2	No	
	OVI2	Overflow 2	No	
3	IMIA3	Compare match/input capture A3	Yes	
	IMIB3	Compare match/input capture B3	No	
	OVI3	Overflow 3	No	
4	IMIA4	Compare match/input capture A4	No	
	IMIB4	Compare match/input capture B4	No	
	OVI4	Overflow 4	No	Low

Note: * The priority immediately after a reset is indicated. Inter-channel priorities can be changed by settings in IPRA and IPRB.

10.6 Usage Notes

This section describes contention and other matters requiring special attention during ITU operations.

Contention between TCNT Write and Clear: If a counter clear signal occurs in the T_3 state of a TCNT write cycle, clearing of the counter takes priority and the write is not performed. See figure 10.61.

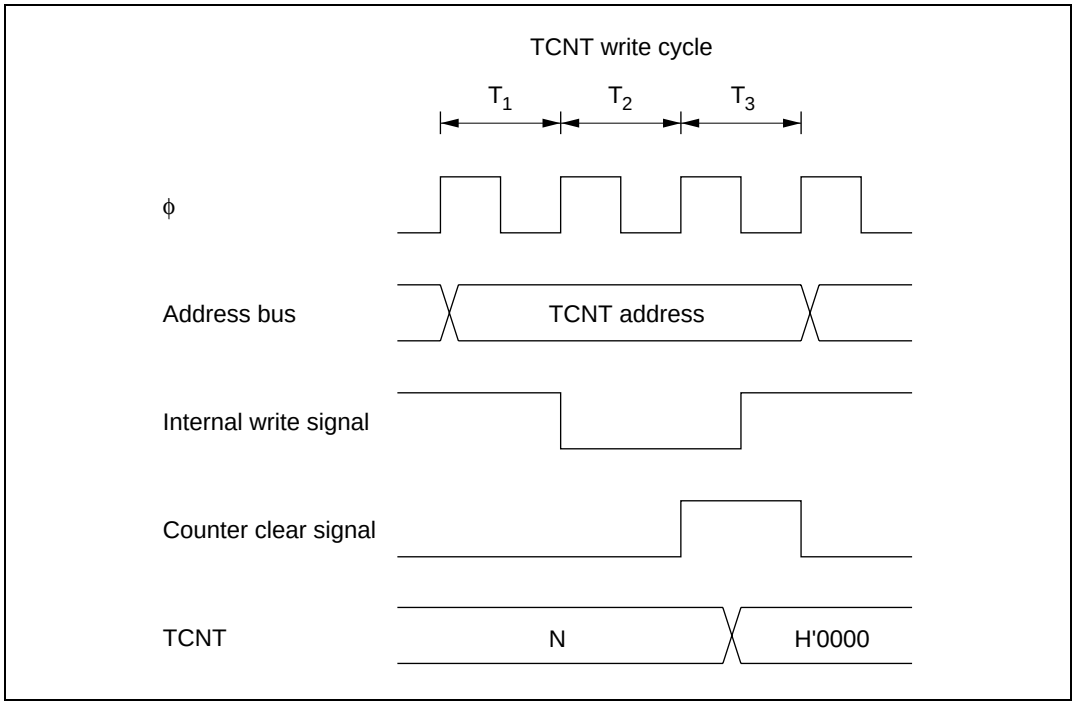

Figure 10.61 Contention between TCNT Write and Clear

Contention between TCNT Word Write and Increment: If an increment pulse occurs in the T_3 state of a TCNT word write cycle, writing takes priority and TCNT is not incremented. See figure 10.62.

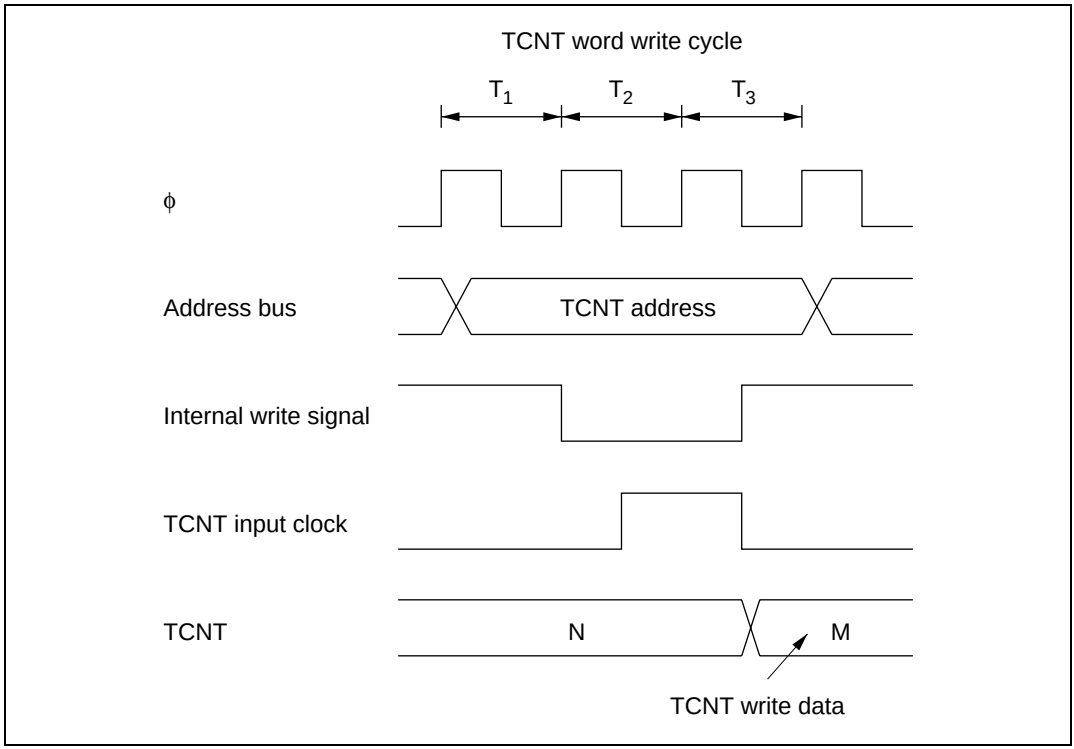

Figure 10.62 Contention between TCNT Word Write and Increment

Contention between TCNT Byte Write and Increment: If an increment pulse occurs in the T_2 or T_3 state of a TCNT byte write cycle, writing takes priority and TCNT is not incremented. The TCNT byte that was not written retains its previous value. See figure 10.63, which shows an increment pulse occurring in the T_2 state of a byte write to TCNTH.

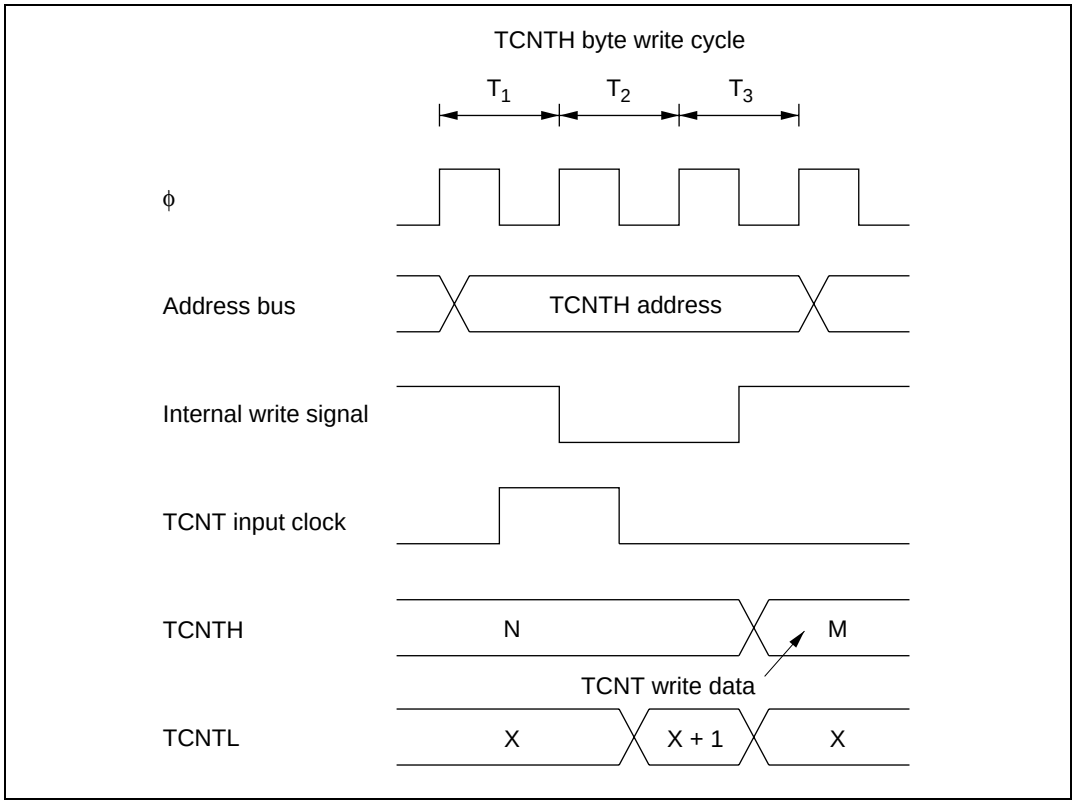

Figure 10.63 Contention between TCNT Byte Write and Increment

Contention between General Register Write and Compare Match: If a compare match occurs in the T_3 state of a general register write cycle, writing takes priority and the compare match signal is inhibited. See figure 10.64.

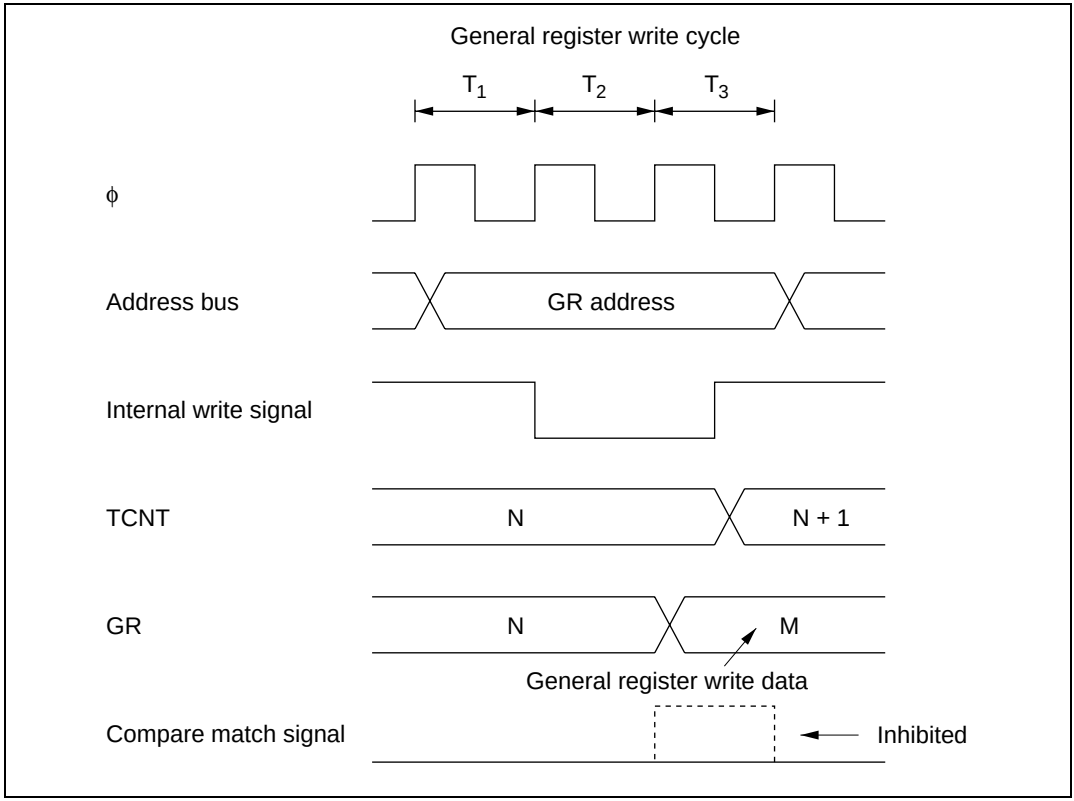

Figure 10.64 Contention between General Register Write and Compare Match

Contention between TCNT Write and Overflow or Underflow: If an overflow occurs in the T_3 state of a TCNT write cycle, writing takes priority and the counter is not incremented. OVF is set to 1.The same holds for underflow. See figure 10.65.

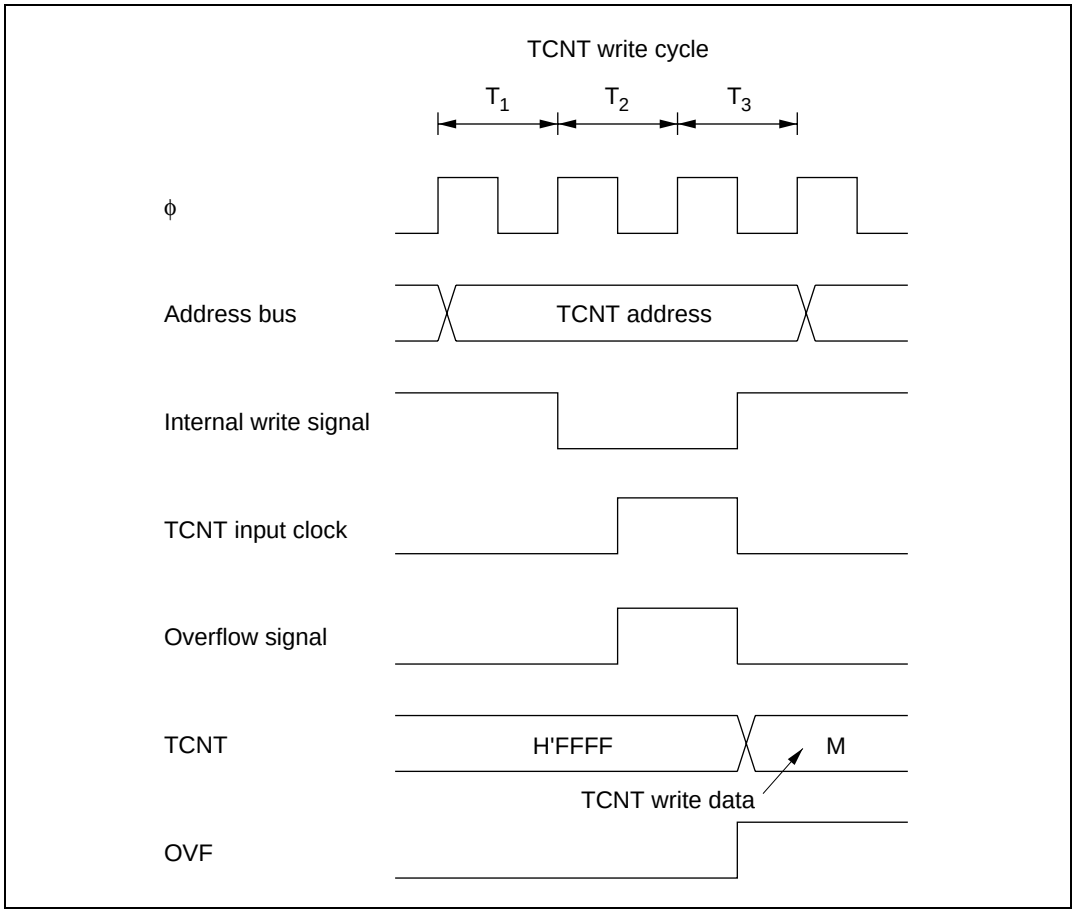

Figure 10.65 Contention between TCNT Write and Overflow

Contention between General Register Read and Input Capture: If an input capture signal occurs during the T_3 state of a general register read cycle, the value before input capture is read. See figure 10.66.

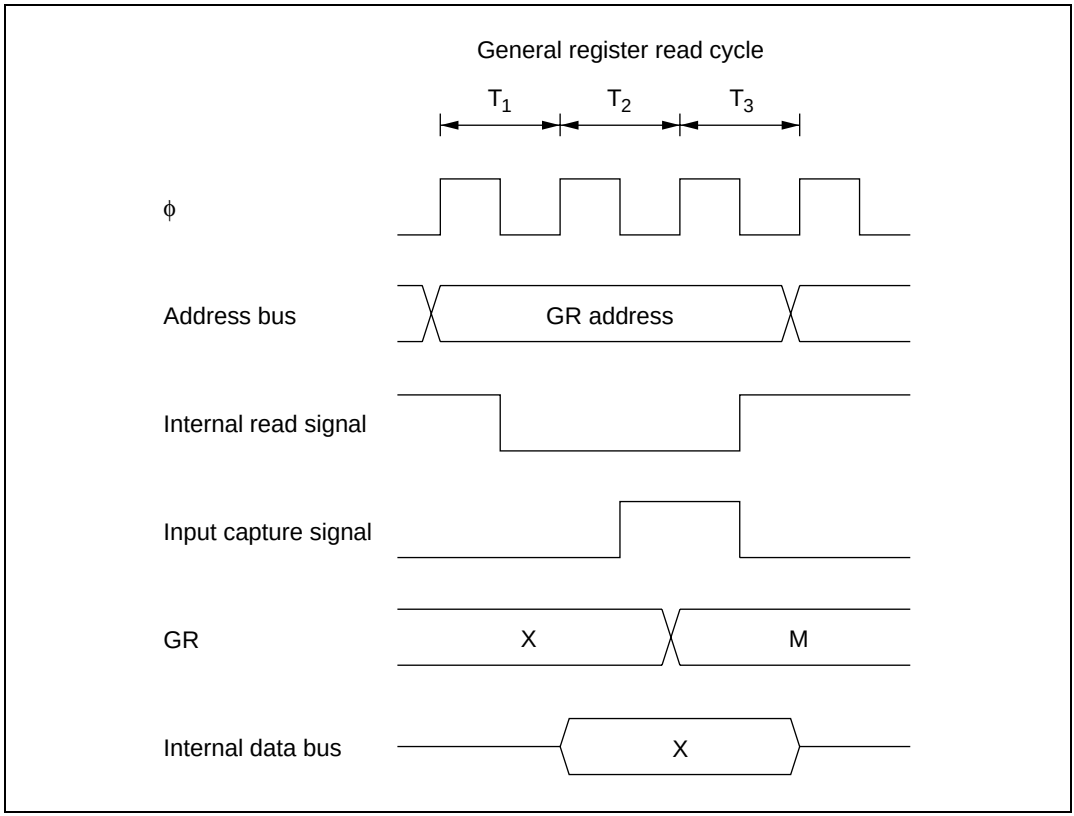

Figure 10.66 Contention between General Register Read and Input Capture

Contention between Counter Clearing by Input Capture and Counter Increment: If an input capture signal and counter increment signal occur simultaneously, the counter is cleared according to the input capture signal. The counter is not incremented by the increment signal. The value before the counter is cleared is transferred to the general register. See figure 10.67.

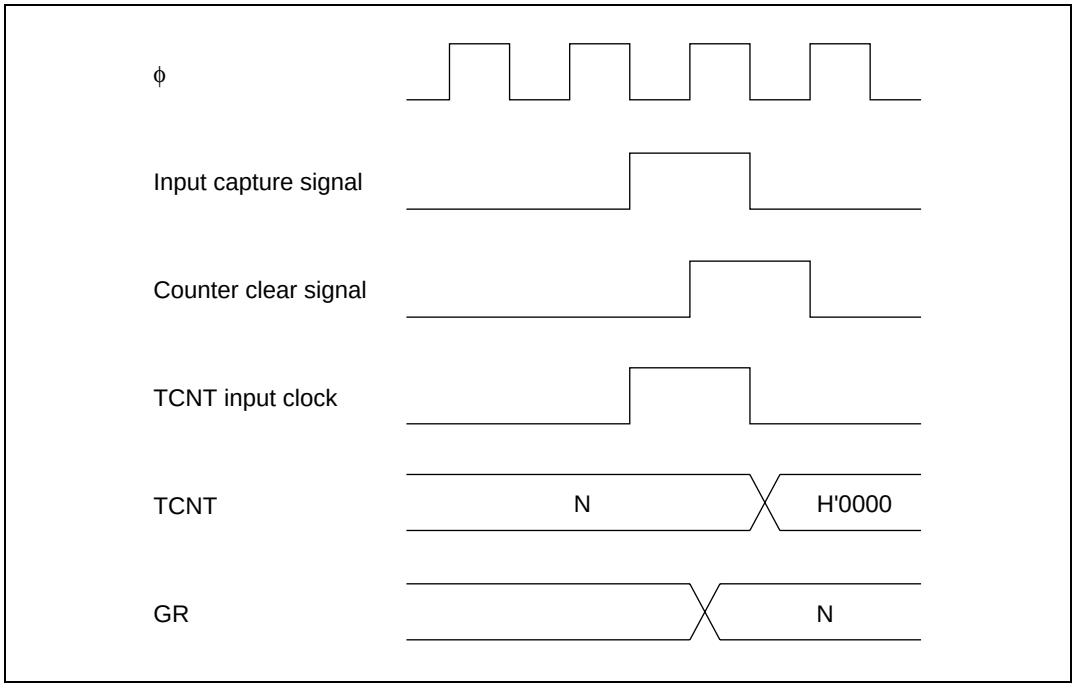

Figure 10.67 Contention between Counter Clearing by Input Capture and Counter Increment

Contention between General Register Write and Input Capture: If an input capture signal occurs in the T_3 state of a general register write cycle, input capture takes priority and the write to the general register is not performed. See figure 10.68.

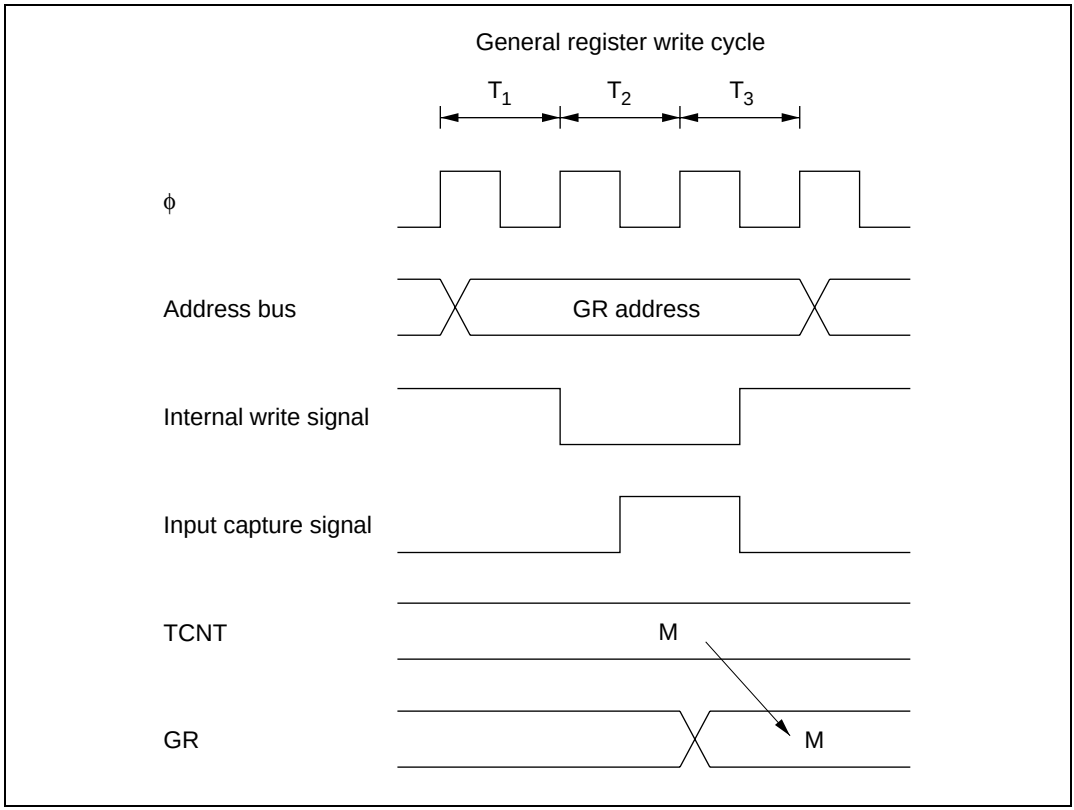

Figure 10.68 Contention between General Register Write and Input Capture

Note on Waveform Period Setting: When a counter is cleared by compare match, the counter is cleared in the last state at which the TCNT value matches the general register value, at the time when this value would normally be updated to the next count. The actual counter frequency is therefore given by the following formula:

$$f = \frac{\phi}{(N + 1)}$$

(f: counter frequency. ϕ: system clock frequency. N: value set in general register.)

Contention between Buffer Register Write and Input Capture: If a buffer register is used for input capture buffering and an input capture signal occurs in the T_3 state of a write cycle, input capture takes priority and the write to the buffer register is not performed. See figure 10.69.

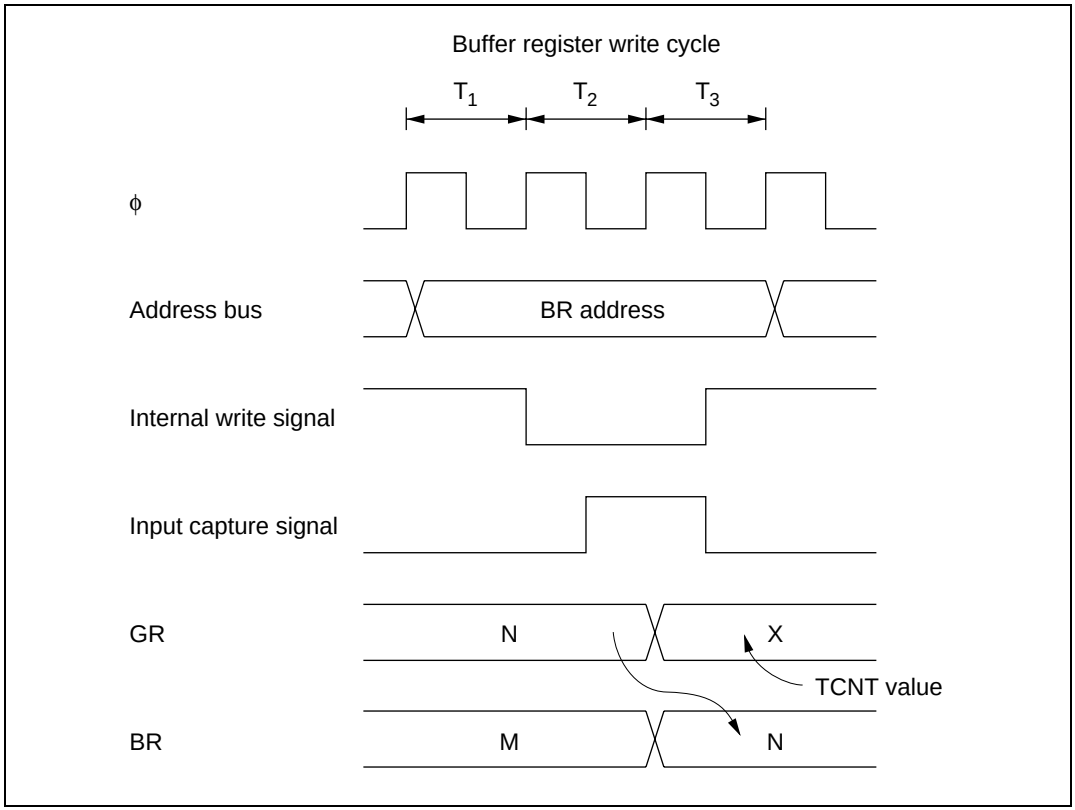

Figure 10.69 Contention between Buffer Register Write and Input Capture

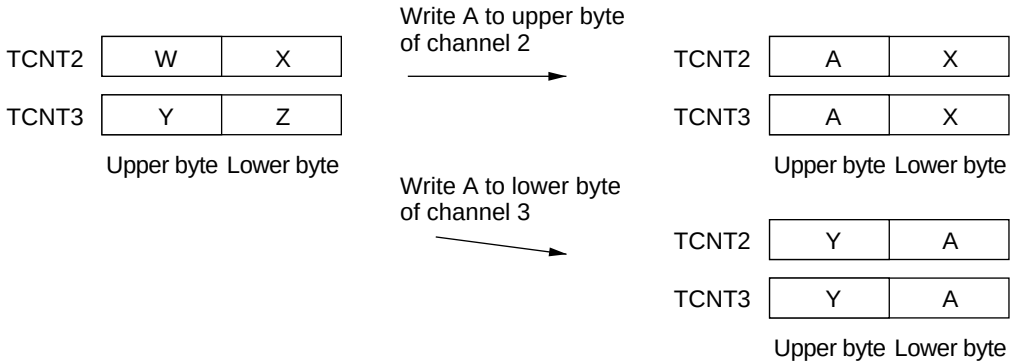
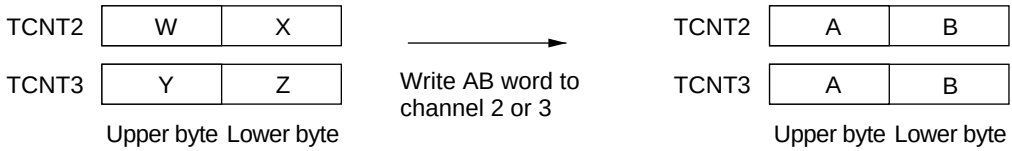
Note on Write Operations when Using Synchronous Operation: When channels are synchronized, if a TCNT value is modified by byte write access, all 16 bits of all synchronized counters assume the same value as the counter that was addressed.

Example: When channels 2 and 3 are synchronized

- Byte write to channel 2 or byte write to channel 3



- Word write to channel 2 or word write to channel 3



Note on Setup of Reset-Synchronized PWM Mode and Complementary PWM Mode: When setting bits CMD1 and CMD0 in TFCR, take the following precautions:

- Write to bits CMD1 and CMD0 only when TCNT3 and TCNT4 are stopped.
- Do not switch directly between reset-synchronized PWM mode and complementary PWM mode. First switch to normal mode (by clearing bit CMD1 to 0), then select reset-synchronized PWM mode or complementary PWM mode.

ITU Operating Modes

Table 10.11 (1) ITU Operating Modes (Channel 0)

Operating Mode		Register Settings															
		TSNC	TMDR			TFCR			TOCR		TOER	TIOR0		TCR0			
		Synchro-nization	MDF	FDIR	PWM	Comple-mentary PWM	Reset-Synchro-nized PWM	Buffer-ing	XTGD	Output Level Select	Master Enable	IOA	IOB	Clear Select	Clock Select

Buffering (BRA)		○	—	—	○	○	○	BFA4 = 1 Other bits unrestricted	—	—	○*1	○	○	○	○
Buffering (BRB)		○	—	—	○	○	○	BFB4 = 1 Other bits unrestricted	—	—	○*1	○	○	○	○

Legend: ○ Setting available (valid). — Setting does not affect this mode.

Notes: 1. Master enable bit settings are valid only during waveform output.
2. The input capture function cannot be used in PWM mode. If compare match A and compare match B occur simultaneously, the compare match signal is inhibited.
3. Do not set both channels 3 and 4 for synchronous operation when complementary PWM mode is selected.
4. When reset-synchronized PWM mode is selected, TCNT4 operates independently and the counter clearing function is available. Waveform output is not affected.
5. In complementary PWM mode, select the same clock source for channels 3 and 4.
6. TCR4 settings are valid in reset-synchronized PWM mode, but TCNT4 operates independently, without affecting waveform output.

Section 11 Programmable Timing Pattern Controller

11.1 Overview

The H8/3052BF has a built-in programmable timing pattern controller (TPC) that provides pulse outputs by using the 16-bit integrated timer unit (ITU) as a time base. The TPC pulse outputs are divided into 4-bit groups (group 3 to group 0) that can operate simultaneously and independently.

11.1.1 Features

TPC features are listed below.

- 16-bit output data
  Maximum 16-bit data can be output. TPC output can be enabled on a bit-by-bit basis.
- Four output groups
  Output trigger signals can be selected in 4-bit groups to provide up to four different 4-bit outputs.
- Selectable output trigger signals
  Output trigger signals can be selected for each group from the compare-match signals of four ITU channels.
- Non-overlap mode
  A non-overlap margin can be provided between pulse outputs.
- Can operate together with the DMA controller (DMAC)
  The compare-match signals selected as trigger signals can activate the DMAC for sequential output of data without CPU intervention.

11.1.2 Block Diagram

Figure 11.1 shows a block diagram of the TPC.

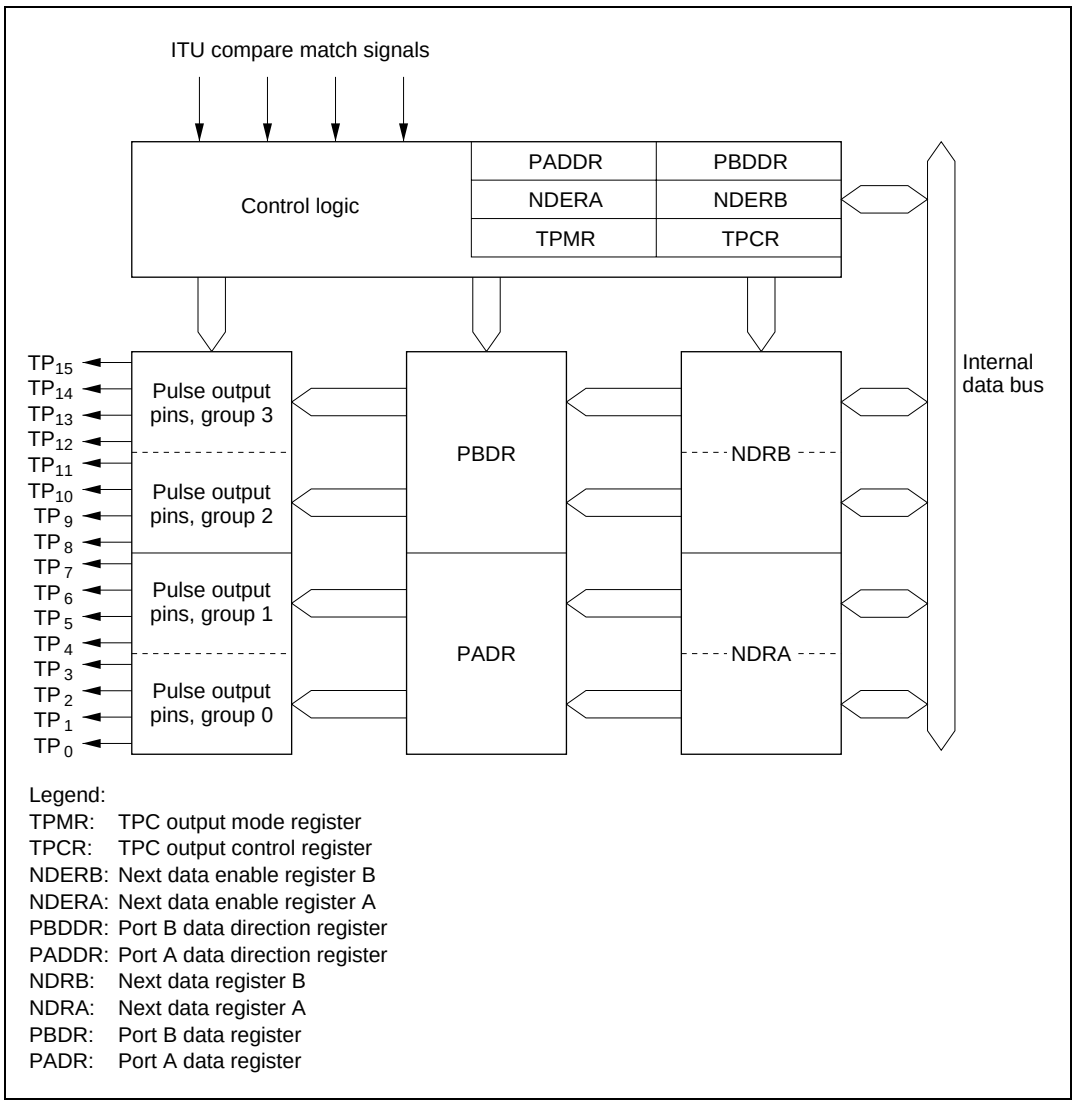

Figure 11.1 TPC Block Diagram

11.1.3 Pin Configuration

Table 11.1 summarizes the TPC output pins.

Table 11.1 TPC Pins

Name	Symbol	I/O	Function
TPC output 0	TP_0	Output	Group 0 pulse output
TPC output 1	TP_1	Output	
TPC output 2	TP_2	Output	
TPC output 3	TP_3	Output	
TPC output 4	TP_4	Output	Group 1 pulse output
TPC output 5	TP_5	Output	
TPC output 6	TP_6	Output	
TPC output 7	TP_7	Output	
TPC output 8	TP_8	Output	Group 2 pulse output
TPC output 9	TP_9	Output	
TPC output 10	TP_{10}	Output	
TPC output 11	TP_{11}	Output	
TPC output 12	TP_{12}	Output	Group 3 pulse output
TPC output 13	TP_{13}	Output	
TPC output 14	TP_{14}	Output	
TPC output 15	TP_{15}	Output	

11.1.4 Register Configuration

Table 11.2 summarizes the TPC registers.

Table 11.2 TPC Registers

Address*1	Name	Abbreviation	R/W	Initial Value
H'FFD1	Port A data direction register	PADDR	W	H'00
H'FFD3	Port A data register	PADR	R/(W)*2	H'00
H'FFD4	Port B data direction register	PBDDR	W	H'00
H'FFD6	Port B data register	PBDR	R/(W)*2	H'00
H'FFA0	TPC output mode register	TPMR	R/W	H'F0
H'FFA1	TPC output control register	TPCR	R/W	H'FF
H'FFA2	Next data enable register B	NDERB	R/W	H'00
H'FFA3	Next data enable register A	NDERA	R/W	H'00
H'FFA5/ H'FFA7*3	Next data register A	NDRA	R/W	H'00
H'FFA4 H'FFA6*3	Next data register B	NDRB	R/W	H'00

Notes: 1. Lower 16 bits of the address.
2. Bits used for TPC output cannot be written.
3. The NDRA address is H'FFA5 when the same output trigger is selected for TPC output groups 0 and 1 by settings in TPCR. When the output triggers are different, the NDRA address is H'FFA7 for group 0 and H'FFA5 for group 1. Similarly, the address of NDRB is H'FFA4 when the same output trigger is selected for TPC output groups 2 and 3 by settings in TPCR. When the output triggers are different, the NDRB address is H'FFA6 for group 2 and H'FFA4 for group 3.

11.2 Register Descriptions

11.2.1 Port A Data Direction Register (PADDR)

PADDR is an 8-bit write-only register that selects input or output for each pin in port A.

Bit	7	6	5	4	3	2	1	0
	PA_7DDR	PA_6DDR	PA_5DDR	PA_4DDR	PA_3DDR	PA_2DDR	PA_1DDR	PA_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0
These bits select input or output for port A pins

Port A is multiplexed with pins TP_7 to TP_0. Bits corresponding to pins used for TPC output must be set to 1. For further information about PADDR, see section 9.11, Port A.

11.2.2 Port A Data Register (PADR)

PADR is an 8-bit readable/writable register that stores TPC output data for groups 0 and 1, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PA_7	PA_6	PA_5	PA_4	PA_3	PA_2	PA_1	PA_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port A data 7 to 0
These bits store output data for TPC output groups 0 and 1

Note: * Bits selected for TPC output by NDERA settings become read-only bits.

For further information about PADR, see section 9.11, Port A.

11.2.3 Port B Data Direction Register (PBDDR)

PBDDR is an 8-bit write-only register that selects input or output for each pin in port B.

Bit	7	6	5	4	3	2	1	0
	PB_7DDR	PB_6DDR	PB_5DDR	PB_4DDR	PB_3DDR	PB_2DDR	PB_1DDR	PB_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0
These bits select input or output for port B pins

Port B is multiplexed with pins TP_{15} to TP_8. Bits corresponding to pins used for TPC output must be set to 1. For further information about PBDDR, see section 9.12, Port B.

11.2.4 Port B Data Register (PBDR)

PBDR is an 8-bit readable/writable register that stores TPC output data for groups 2 and 3, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PB_7	PB_6	PB_5	PB_4	PB_3	PB_2	PB_1	PB_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port B data 7 to 0
These bits store output data for TPC output groups 2 and 3

Note: * Bits selected for TPC output by NDERB settings become read-only bits.

For further information about PBDR, see section 9.12, Port B.

11.2.5 Next Data Register A (NDRA)

NDRA is an 8-bit readable/writable register that stores the next output data for TPC output groups 1 and 0 (pins TP_7 to TP_0). During TPC output, when an ITU compare match event specified in TPCR occurs, NDRA contents are transferred to the corresponding bits in PADR. The address of NDRA differs depending on whether TPC output groups 0 and 1 have the same output trigger or different output triggers.

NDRA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by the same compare match event, the NDRA address is H'FFA5. The upper 4 bits belong to group 1 and the lower 4 bits to group 0. Address H'FFA7 consists entirely of reserved bits that cannot be modified and are always read as 1.

Address H'FFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	NDR3	NDR2	NDR1	NDR0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 7 to 4
These bits store the next output data for TPC output group 1

Next data 3 to 0
These bits store the next output data for TPC output group 0

Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by different compare match events, the address of the upper 4 bits of NDRA (group 1) is H'FFA5 and the address of the lower 4 bits (group 0) is H'FFA7. Bits 3 to 0 of address H'FFA5 and bits 7 to 4 of address H'FFA7 are reserved bits that cannot be modified and are always read as 1.

Address H'FFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 7 to 4
These bits store the next output data for TPC output group 1

Reserved bits

Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR3	NDR2	NDR1	NDR0
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Next data 3 to 0
These bits store the next output data for TPC output group 0

11.2.6 Next Data Register B (NDRB)

NDRB is an 8-bit readable/writable register that stores the next output data for TPC output groups 3 and 2 (pins TP_{15} to TP_8). During TPC output, when an ITU compare match event specified in TPCR occurs, NDRB contents are transferred to the corresponding bits in PBDR. The address of NDRB differs depending on whether TPC output groups 2 and 3 have the same output trigger or different output triggers.

NDRB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by the same compare match event, the NDRB address is H'FFA4. The upper 4 bits belong to group 3 and the lower 4 bits to group 2. Address H'FFA6 consists entirely of reserved bits that cannot be modified and are always read as 1.

Address H'FFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	NDR11	NDR10	NDR9	NDR8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 15 to 12
These bits store the next output data for TPC output group 3

Next data 11 to 8
These bits store the next output data for TPC output group 2

Address H'FFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by different compare match events, the address of the upper 4 bits of NDRB (group 3) is H'FFA4 and the address of the lower 4 bits (group 2) is H'FFA6. Bits 3 to 0 of address H'FFA4 and bits 7 to 4 of address H'FFA6 are reserved bits that cannot be modified and are always read as 1.

Address H'FFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 15 to 12
These bits store the next output data for TPC output group 3

Reserved bits

Address H'FFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR11	NDR10	NDR9	NDR8
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Next data 11 to 8
These bits store the next output data for TPC output group 2

11.2.7 Next Data Enable Register A (NDERA)

NDERA is an 8-bit readable/writable register that enables or disables TPC output groups 1 and 0 (TP_7 to TP_0) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER7	NDER6	NDER5	NDER4	NDER3	NDER2	NDER1	NDER0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 7 to 0
These bits enable or disable TPC output groups 1 and 0

If a bit is enabled for TPC output by NDERA, then when the ITU compare match event selected in the TPC output control register (TPCR) occurs, the NDRA value is automatically transferred to the corresponding PADR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRA to PADR and the output value does not change.

NDERA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 7 to 0 (NDER7 to NDER0): These bits enable or disable TPC output groups 1 and 0 (TP_7 to TP_0) on a bit-by-bit basis.

Bits 7 to 0: NDER7 to NDER0	**Description**	
0	TPC outputs TP_7 to TP_0 are disabled (NDR7 to NDR0 are not transferred to PA_7 to PA_0)	(Initial value)
1	TPC outputs TP_7 to TP_0 are enabled (NDR7 to NDR0 are transferred to PA_7 to PA_0)	

11.2.8 Next Data Enable Register B (NDERB)

NDERB is an 8-bit readable/writable register that enables or disables TPC output groups 3 and 2 (TP_{15} to TP_8) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER15	NDER14	NDER13	NDER12	NDER11	NDER10	NDER9	NDER8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 15 to 8
These bits enable or disable TPC output groups 3 and 2

If a bit is enabled for TPC output by NDERB, then when the ITU compare match event selected in the TPC output control register (TPCR) occurs, the NDRB value is automatically transferred to the corresponding PBDR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRB to PBDR and the output value does not change.

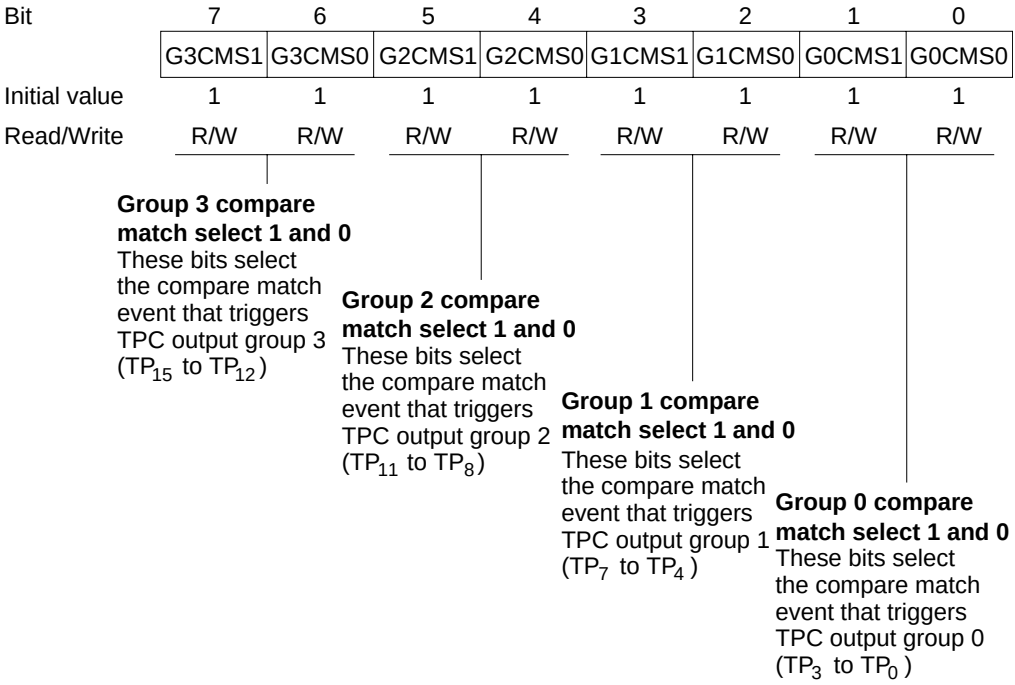
NDERB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 15 to 8 (NDER15 to NDER8): These bits enable or disable TPC output groups 3 and 2 (TP_{15} to TP_8) on a bit-by-bit basis.

Bits 7 to 0: NDER15 to NDER8	**Description**	
0	TPC outputs TP_{15} to TP_8 are disabled (NDR15 to NDR8 are not transferred to PB_7 to PB_0)	(Initial value)
1	TPC outputs TP_{15} to TP_8 are enabled (NDR15 to NDR8 are transferred to PB_7 to PB_0)	

11.2.9 TPC Output Control Register (TPCR)

TPCR is an 8-bit readable/writable register that selects output trigger signals for TPC outputs on a group-by-group basis.



TPCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 and 6—Group 3 Compare Match Select 1 and 0 (G3CMS1, G3CMS0): These bits select the compare match event that triggers TPC output group 3 (TP_{15} to TP_{12}).

Bit 7: G3CMS1	Bit 6: G3CMS0	Description
0	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 0
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 1
1	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 2
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 3 (Initial value)

Bits 5 and 4—Group 2 Compare Match Select 1 and 0 (G2CMS1, G2CMS0): These bits select the compare match event that triggers TPC output group 2 (TP_{11} to TP_8).

Bit 5: G2CMS1	Bit 4: G2CMS0	Description
0	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 0
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 1
1	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 2
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 3 (Initial value)

Bits 3 and 2—Group 1 Compare Match Select 1 and 0 (G1CMS1, G1CMS0): These bits select the compare match event that triggers TPC output group 1 (TP_7 to TP_4).

Bit 3: G1CMS1	Bit 2: G1CMS0	Description
0	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 0
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 1
1	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 2
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 3 (Initial value)

Bits 1 and 0—Group 0 Compare Match Select 1 and 0 (G0CMS1, G0CMS0): These bits select the compare match event that triggers TPC output group 0 (TP_3 to TP_0).

Bit 1: G0CMS1	Bit 0: G0CMS0	Description
0	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 0
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 1
1	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 2
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 3 (Initial value)

11.2.10 TPC Output Mode Register (TPMR)

TPMR is an 8-bit readable/writable register that selects normal or non-overlapping TPC output for each group.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	G3NOV	G2NOV	G1NOV	G0NOV
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Group 3 non-overlap
Selects non-overlapping TPC output for group 3 (TP_{15} to TP_{12})

Group 2 non-overlap
Selects non-overlapping TPC output for group 2 (TP_{11} to TP_{8})

Group 1 non-overlap
Selects non-overlapping TPC output for group 1 (TP_{7} to TP_{4})

Group 0 non-overlap
Selects non-overlapping TPC output for group 0 (TP_{3} to TP_{0})

The output trigger period of a non-overlapping TPC output waveform is set in general register B (GRB) in the ITU channel selected for output triggering. The non-overlap margin is set in general register A (GRA). The output values change at compare match A and B. For details see section 11.3.4, Non-Overlapping TPC Output.

TPMR is initialized to H'F0 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—Group 3 Non-Overlap (G3NOV): Selects normal or non-overlapping TPC output for group 3 (TP_{15} to TP_{12}).

Bit 3: G3NOV	Description
0	Normal TPC output in group 3 (output values change at compare match A in the selected ITU channel) (Initial value)
1	Non-overlapping TPC output in group 3 (independent 1 and 0 output at compare match A and B in the selected ITU channel)

Bit 2—Group 2 Non-Overlap (G2NOV): Selects normal or non-overlapping TPC output for group 2 (TP_{11} to TP_8).

Bit 2: G2NOV	Description
0	Normal TPC output in group 2 (output values change at compare match A in the selected ITU channel) (Initial value)
1	Non-overlapping TPC output in group 2 (independent 1 and 0 output at compare match A and B in the selected ITU channel)

Bit 1—Group 1 Non-Overlap (G1NOV): Selects normal or non-overlapping TPC output for group 1 (TP_7 to TP_4).

Bit 1: G1NOV	Description
0	Normal TPC output in group 1 (output values change at compare match A in the selected ITU channel) (Initial value)
1	Non-overlapping TPC output in group 1 (independent 1 and 0 output at compare match A and B in the selected ITU channel)

Bit 0—Group 0 Non-Overlap (G0NOV): Selects normal or non-overlapping TPC output for group 0 (TP_3 to TP_0).

Bit 0: G0NOV	Description
0	Normal TPC output in group 0 (output values change at compare match A in the selected ITU channel) (Initial value)
1	Non-overlapping TPC output in group 0 (independent 1 and 0 output at compare match A and B in the selected ITU channel)

11.3 Operation

11.3.1 Overview

When corresponding bits in PADDR or PBDDR and NDERA or NDERB are set to 1, TPC output is enabled. The TPC output initially consists of the corresponding PADR or PBDR contents. When a compare-match event selected in TPCR occurs, the corresponding NDRA or NDRB bit contents are transferred to PADR or PBDR to update the output values.

Figure 11.2 illustrates the TPC output operation. Table 11.3 summarizes the TPC operating conditions.

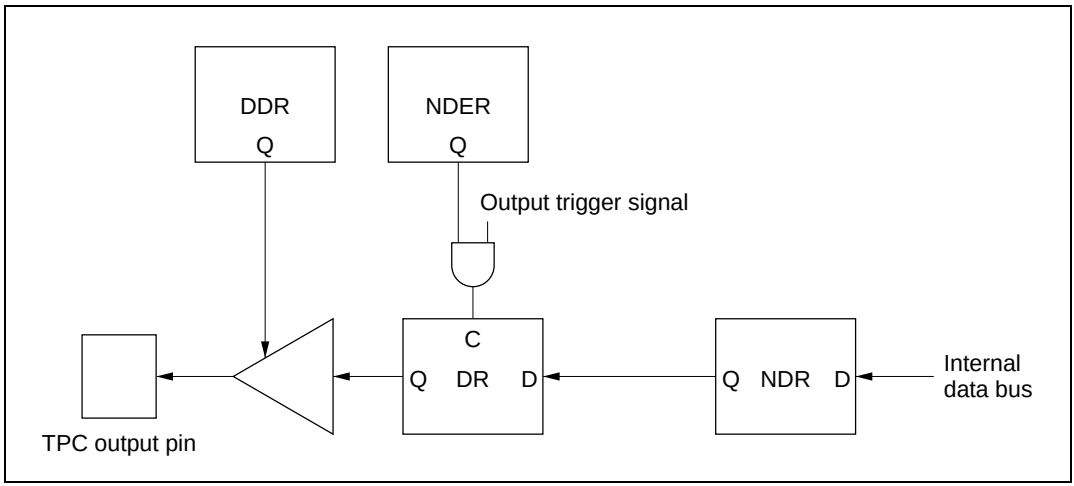


Figure 11.2 TPC Output Operation

Table 11.3 TPC Operating Conditions

NDER	DDR	Pin Function
0	0	Generic input port
	1	Generic output port
1	0	Generic input port (but the DR bit is a read-only bit, and when compare match occurs, the NDR bit value is transferred to the DR bit)
	1	TPC pulse output

Sequential output of up to 16-bit patterns is possible by writing new output data to NDRA and NDRB before the next compare match. For information on non-overlapping operation, see section 11.3.4, Non-Overlapping TPC Output.

11.3.2 Output Timing

If TPC output is enabled, NDRA/NDRB contents are transferred to PADR/PBDR and output when the selected compare match event occurs. Figure 11.3 shows the timing of these operations for the case of normal output in groups 2 and 3, triggered by compare match A.

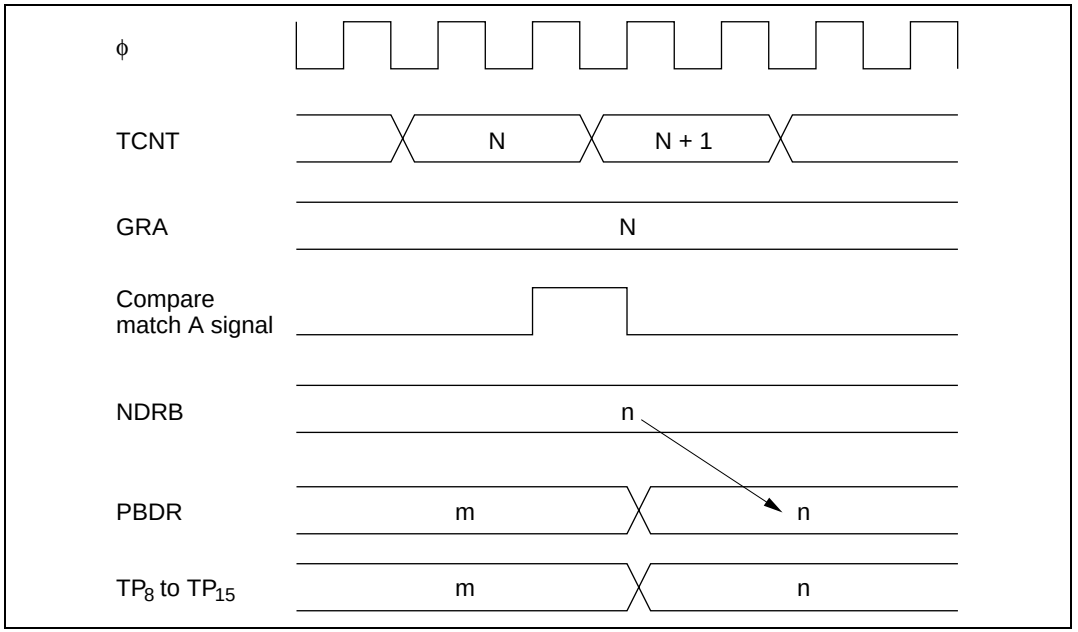

Figure 11.3 Timing of Transfer of Next Data Register Contents and Output (Example)

11.3.3 Normal TPC Output

Sample Setup Procedure for Normal TPC Output: Figure 11.4 shows a sample procedure for setting up normal TPC output.

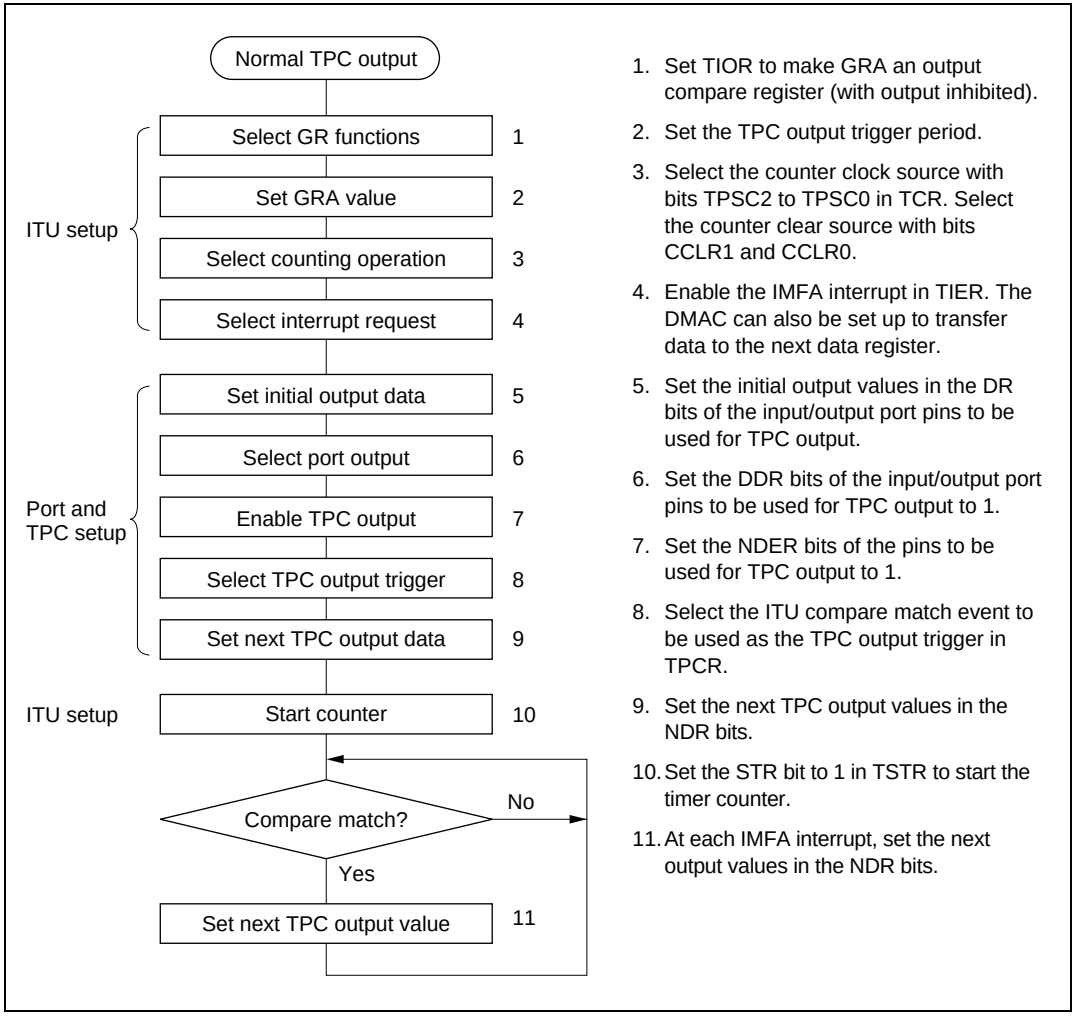

Figure 11.4 Setup Procedure for Normal TPC Output (Example)

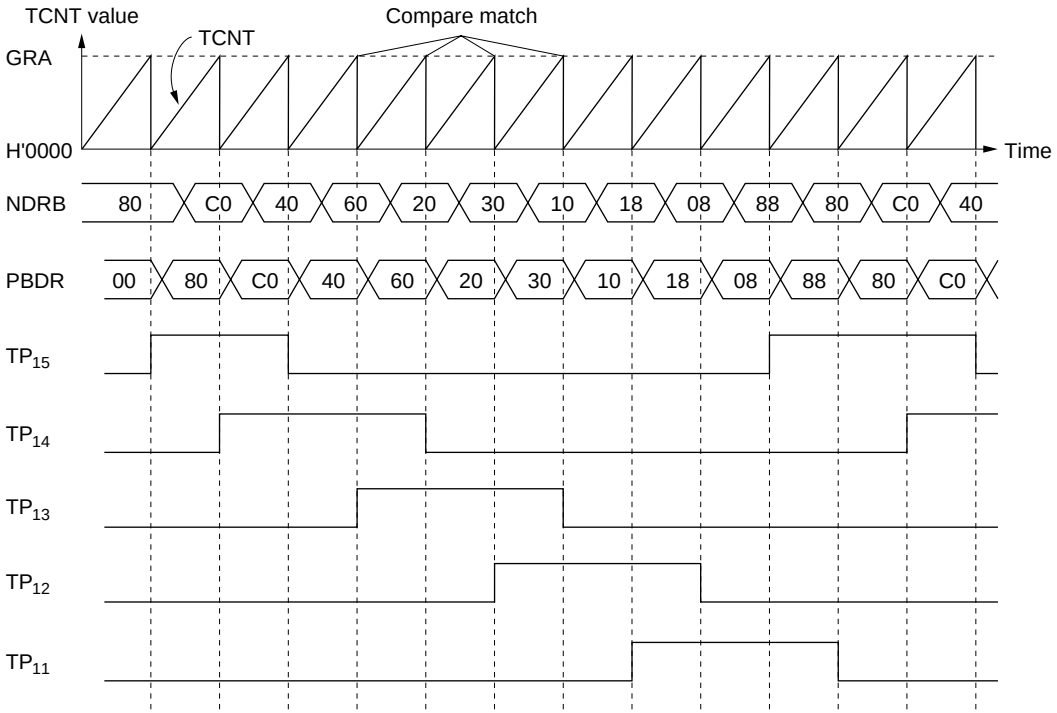
Example of Normal TPC Output (Example of Five-Phase Pulse Output): Figure 11.5 shows an example in which the TPC is used for cyclic five-phase pulse output.

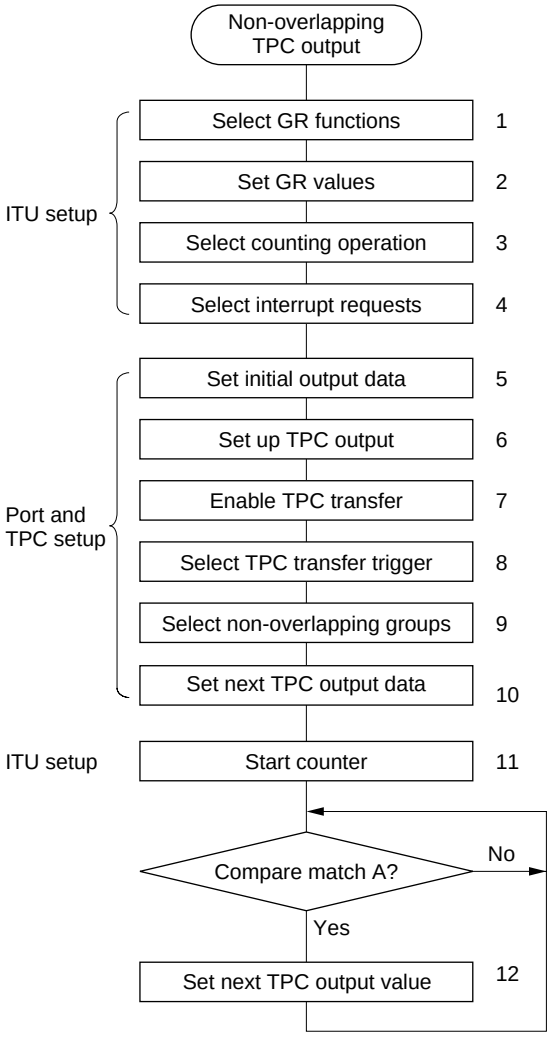


1. The ITU channel to be used as the output trigger channel is set up so that GRA is an output compare register and the counter will be cleared by compare match A. The trigger period is set in GRA. The IMIEA bit is set to 1 in TIER to enable the compare match A interrupt.
2. H'F8 is written in PBDDR and NDERB, and bits G3CMS1, G3CMS0, G2CMS1, and G2CMS0 are set in TPCR to select compare match in the ITU channel set up in step 1 as the output trigger. Output data H'80 is written in NDRB.
3. The timer counter in this ITU channel is started. When compare match A occurs, the NDRB contents are transferred to PBDR and output. The compare match/input capture A (IMFA) interrupt service routine writes the next output data (H'C0) in NDRB.
4. Five-phase overlapping pulse output (one or two phases active at a time) can be obtained by writing H'40, H'60, H'20, H'30, H'10, H'18, H'08, H'88… at successive IMFA interrupts. If the DMAC is set for activation by this interrupt, pulse output can be obtained without loading the CPU.

Figure 11.5 Normal TPC Output Example (Five-Phase Pulse Output)

11.3.4 Non-Overlapping TPC Output

Sample Setup Procedure for Non-Overlapping TPC Output: Figure 11.6 shows a sample procedure for setting up non-overlapping TPC output.



1. Set TIOR to make GRA and GRB output compare registers (with output inhibited).
2. Set the TPC output trigger period in GRB and the non-overlap margin in GRA.
3. Select the counter clock source with bits TPSC2 to TPSC0 in TCR. Select the counter clear source with bits CCLR1 and CCLR0.
4. Enable the IMFA interrupt in TIER. The DMAC can also be set up to transfer data to the next data register.
5. Set the initial output values in the DR bits of the input/output port pins to be used for TPC output.
6. Set the DDR bits of the input/output port pins to be used for TPC output to 1.
7. Set the NDER bits of the pins to be used for TPC output to 1.
8. In TPCR, select the ITU compare match event to be used as the TPC output trigger.
9. In TPMR, select the groups that will operate in non-overlap mode.
10. Set the next TPC output values in the NDR bits.
11. Set the STR bit to 1 in TSTR to start the timer counter.
12. At each IMFA interrupt, write the next output value in the NDR bits.

Figure 11.6 Setup Procedure for Non-Overlapping TPC Output (Example)

Example of Non-Overlapping TPC Output (Example of Four-Phase Complementary Non-Overlapping Output): Figure 11.7 shows an example of the use of TPC output for four-phase complementary non-overlapping pulse output.

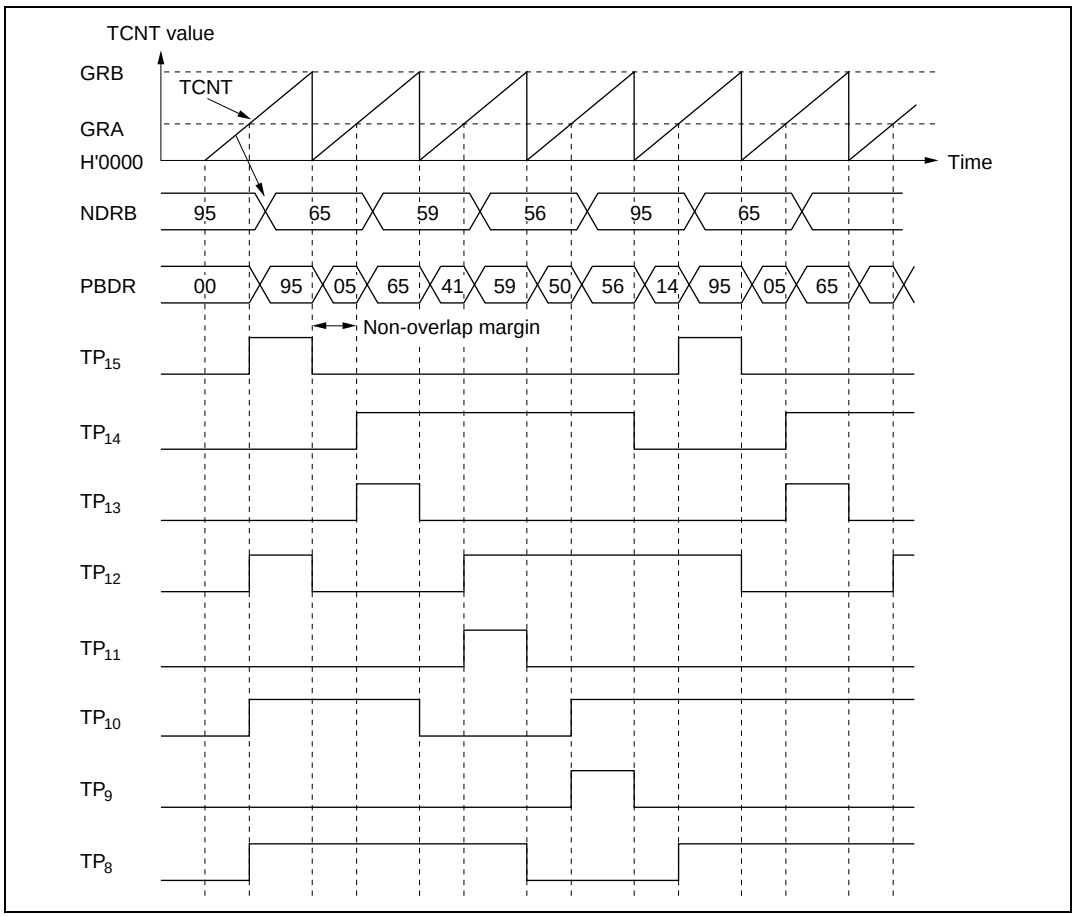


Figure 11.7 Non-Overlapping TPC Output Example (Four-Phase Complementary Non-Overlapping Pulse Output)

This operation example is described below.

- The output trigger ITU channel is set up so that GRA and GRB are output compare registers and the counter will be cleared by compare match B. The TPC output trigger period is set in GRB. The non-overlap margin is set in GRA. The IMIEA bit is set to 1 in TIER to enable IMFA interrupts.

- H'FF is written in PBDDR and NDERB, and bits G3CMS1, G3CMS0, G2CMS1, and G2CMS0 are set in TPCR to select compare match in the ITU channel set up in step 1 as the output trigger. Bits G3NOV and G2NOV are set to 1 in TPMR to select non-overlapping output. Output data H'95 is written in NDRB.
- The timer counter in this ITU channel is started. When compare match B occurs, outputs change from 1 to 0. When compare match A occurs, outputs change from 0 to 1 (the change from 0 to 1 is delayed by the value of GRA). The IMFA interrupt service routine writes the next output data (H'65) in NDRB.
- Four-phase complementary non-overlapping pulse output can be obtained by writing H'59, H'56, H'95… at successive IMFA interrupts. If the DMAC is set for activation by this interrupt, pulse output can be obtained without loading the CPU.

11.3.5 TPC Output Triggering by Input Capture

TPC output can be triggered by ITU input capture as well as by compare match. If GRA, and GRB functions as an input capture register in the ITU channel selected in TPCR, TPC output will be triggered by the input capture signal. Figure 11.8 shows the timing.

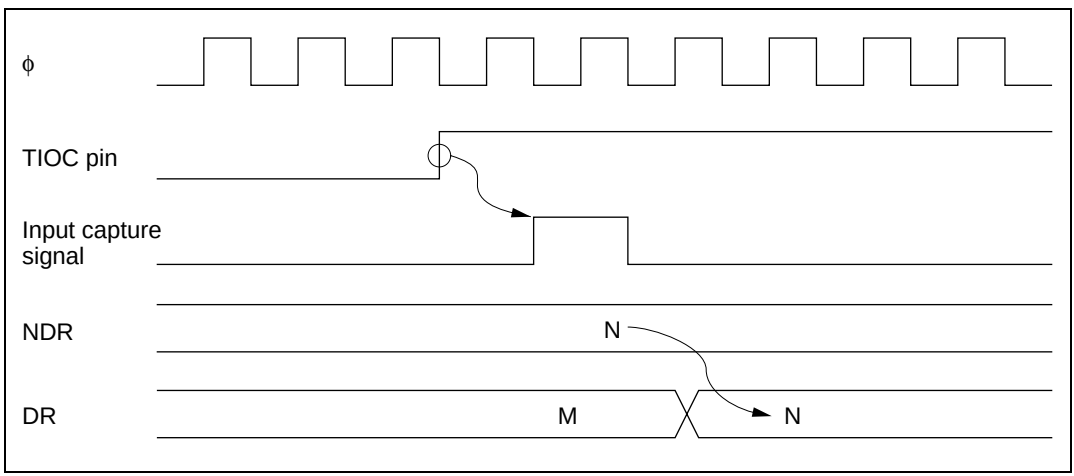

Figure 11.8 TPC Output Triggering by Input Capture (Example)

11.4 Usage Notes

11.4.1 Operation of TPC Output Pins

TP_0 to TP_{15} are multiplexed with ITU, DMAC, address bus, and other pin functions. When ITU, DMAC, or address output is enabled, the corresponding pins cannot be used for TPC output. The data transfer from NDR bits to DR bits takes place, however, regardless of the usage of the pin.

Pin functions should be changed only under conditions in which the output trigger event will not occur.

11.4.2 Note on Non-Overlapping Output

During non-overlapping operation, the transfer of NDR bit values to DR bits takes place as follows.

1. NDR bits are always transferred to DR bits at compare match A.
2. At compare match B, NDR bits are transferred only if their value is 0. Bits are not transferred if their value is 1.

Figure 11.9 illustrates the non-overlapping TPC output operation.

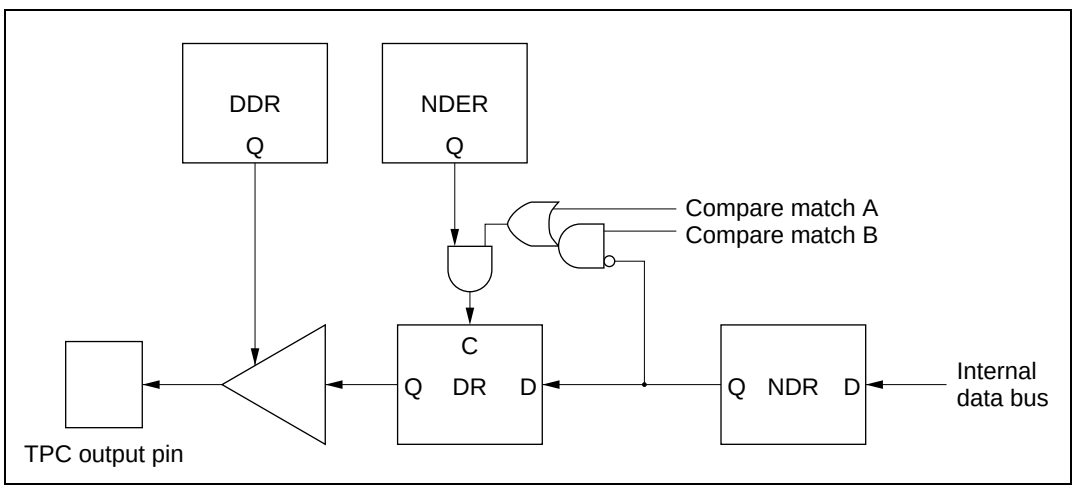

Figure 11.9 Non-Overlapping TPC Output

Therefore, 0 data can be transferred ahead of 1 data by making compare match B occur before compare match A. NDR contents should not be altered during the interval from compare match B to compare match A (the non-overlap margin).

This can be accomplished by having the IMFA interrupt service routine write the next data in NDR, or by having the IMFA interrupt activate the DMAC. The next data must be written before the next compare match B occurs.

Figure 11.10 shows the timing relationships.

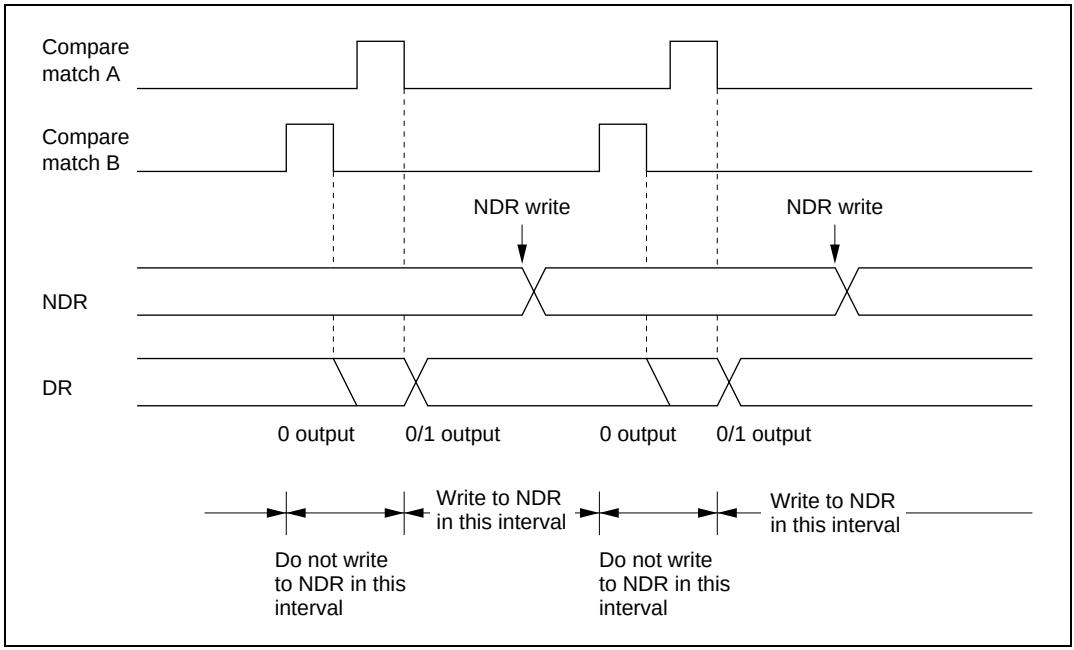

Figure 11.10 Non-Overlapping Operation and NDR Write Timing

Section 12 Watchdog Timer

12.1 Overview

The H8/3052BF has an on-chip watchdog timer (WDT). The WDT has two selectable functions: it can operate as a watchdog timer to supervise system operation, or it can operate as an interval timer. As a watchdog timer, it generates a reset signal for the chip if a system crash allows the timer counter (TCNT) to overflow before being rewritten. In interval timer operation, an interval timer interrupt is requested at each TCNT overflow.

12.1.1 Features

WDT features are listed below.

- Selection of eight counter clock sources
  $\phi/2$, $\phi/32$, $\phi/64$, $\phi/128$, $\phi/256$, $\phi/512$, $\phi/2048$, or $\phi/4096$
- Interval timer option
- Timer counter overflow generates a reset signal or interrupt.
  The reset signal is generated in watchdog timer operation. An interval timer interrupt is generated in interval timer operation.
- Watchdog timer reset signal resets the entire chip internally.
  The reset signal generated by timer counter overflow during watchdog timer operation resets the entire chip internally.
  With the H8/3052BF, a reset signal cannot be output externally.

12.1.2 Block Diagram

Figure 12.1 shows a block diagram of the WDT.

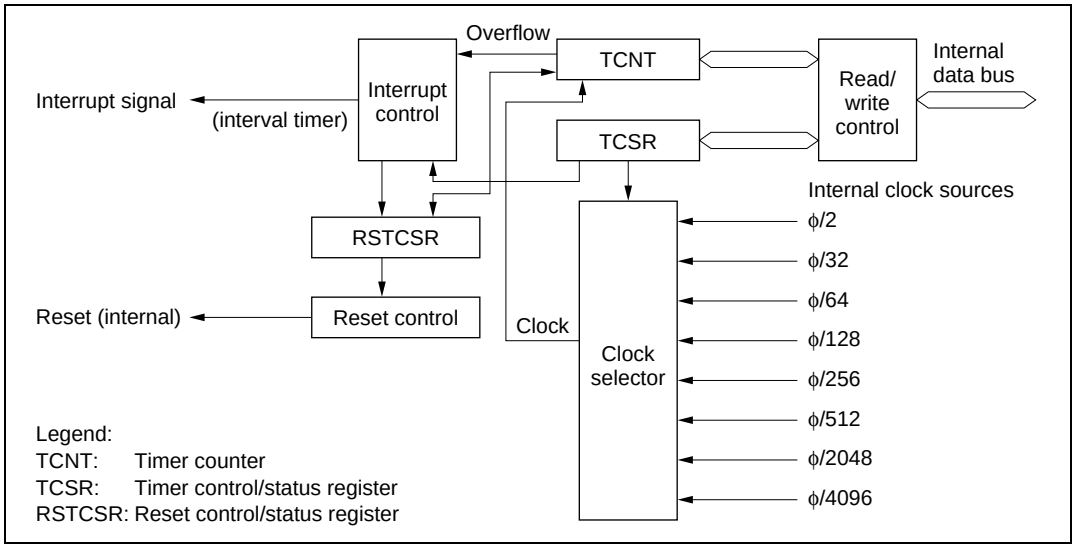

Figure 12.1 WDT Block Diagram

12.1.3 Register Configuration

Table 12.1 summarizes the WDT registers.

Table 12.1 WDT Registers

Address*1					
Write*2	Read	Name	Abbre-viation	R/W	Initial Value
H'FFA8	H'FFA8	Timer control/status register	TCSR	R/(W)*3	H'18
	H'FFA9	Timer counter	TCNT	R/W	H'00
H'FFAA	H'FFAB	Reset control/status register	RSTCSR	R/(W)*3	H'3F

Notes: 1. Lower 16 bits of the address.
2. Write word data starting at this address.
3. Only 0 can be written in bit 7, to clear the flag.

12.2 Register Descriptions

12.2.1 Timer Counter (TCNT)

TCNT is an 8-bit readable and writable* up-counter.

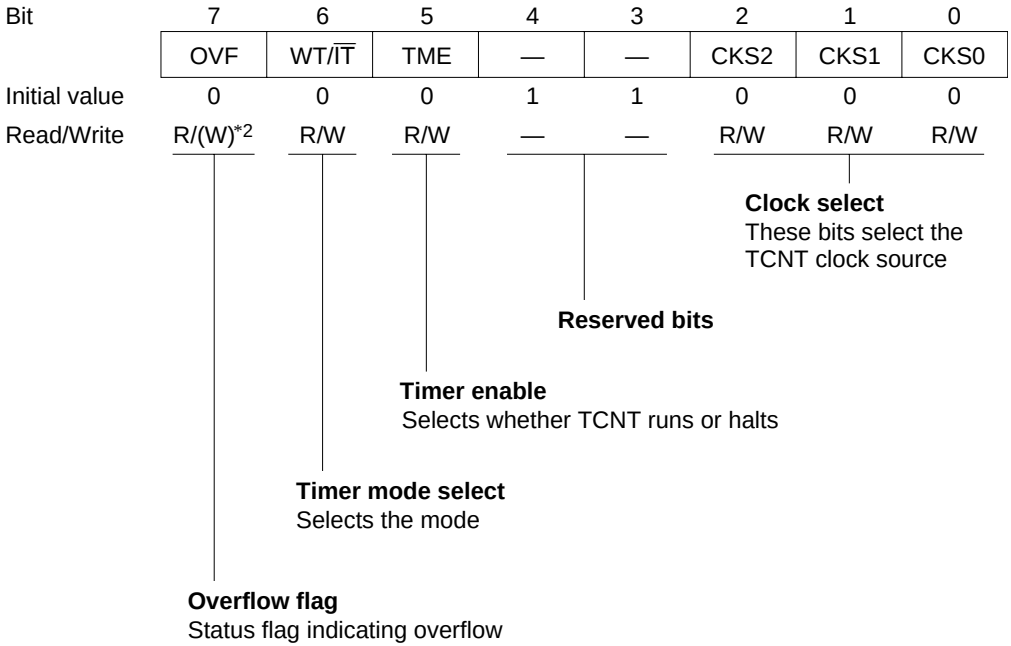
Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When the TME bit is set to 1 in TCSR, TCNT starts counting pulses generated from an internal clock source selected by bits CKS2 to CKS0 in TCSR. When the count overflows (changes from H'FF to H'00), the OVF bit is set to 1 in TCSR. TCNT is initialized to H'00 by a reset and when the TME bit is cleared to 0.

Note: * TCNT is write-protected by a password. For details see section 12.2.4, Notes on Register Access.

12.2.2 Timer Control/Status Register (TCSR)

TCSR is an 8-bit readable and writable*1 register. Its functions include selecting the timer mode and clock source.



Bits 7 to 5 are initialized to 0 by a reset and in standby mode. Bits 2 to 0 are initialized to 0 by a reset. In software standby mode bits 2 to 0 are not initialized, but retain their previous values.

Notes: 1. TCSR differs from other registers in being more difficult to write. For details see section 12.2.4, Notes on Register Access.
2. Only 0 can be written, to clear the flag.

Bit 7—Overflow Flag (OVF): This status flag indicates that the timer counter has overflowed from H'FF to H'00.

Bit 7: OVF	Description
0	[Clearing condition] Cleared by reading OVF when OVF = 1, then writing 0 in OVF (Initial value)
1	[Setting condition] Set when TCNT changes from H'FF to H'00

Bit 6—Timer Mode Select (WT/$\overline{IT}$): Selects whether to use the WDT as a watchdog timer or interval timer. If used as an interval timer, the WDT generates an interval timer interrupt request when TCNT overflows. If used as a watchdog timer, the WDT generates a reset signal when TCNT overflows.

Bit 6: WT/$\overline{IT}$	Description	
0	Interval timer: requests interval timer interrupts	(Initial value)
1	Watchdog timer: generates a reset signal	

Bit 5—Timer Enable (TME): Selects whether TCNT runs or is halted.

When WT/$\overline{IT}$ = 1, clear the SYSCR software standby bit (SSBY) to 0, then set the TME to 1. When SSBY is set to 1, clear TME to 0.

Bit 5: TME	Description	
0	TCNT is initialized to H'00 and halted	(Initial value)
1	TCNT is counting and CPU interrupt requests are enabled	

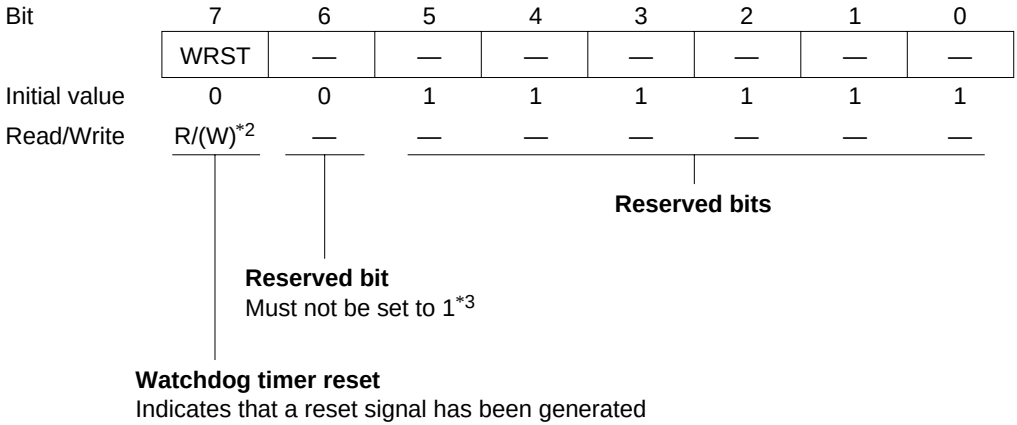
Bits 4 and 3—Reserved: Read-only bits, always read as 1.

Bits 2 to 0—Clock Select 2 to 0 (CKS2/1/0): These bits select one of eight internal clock sources, obtained by prescaling the system clock (φ), for input to TCNT.

Bit 2: CKS2	Bit 1: CKS1	Bit 0: CKS0	Description	
0	0	0	φ/2	(Initial value)
		1	φ/32	
	1	0	φ/64	
		1	φ/128	
1	0	0	φ/256	
		1	φ/512	
	1	0	φ/2048	
		1	φ/4096	

12.2.3 Reset Control/Status Register (RSTCSR)

RSTCSR is an 8-bit readable/writable*1 register that monitors the state of the reset signal generated by watchdog timer overflow.



Bit 7 is initialized by input of a reset signal at the $\overline{\text{RES}}$ pin. It is not initialized by reset signals generated by watchdog timer overflow.

Notes: 1. RSTCSR differs from other registers in being more difficult to write. For details see section 12.2.4, Notes on Register Access.
2. Only 0 can be written in bit 7, to clear the flag.
3. Do not set bit 6 to 1.

Bit 7—Watchdog Timer Reset (WRST): During watchdog timer operation, this bit indicates that TCNT has overflowed and generated a reset signal. This reset signal resets the entire chip internally.

Bit 7: WRST	Description
0	[Clearing conditions] • Cleared to 0 by reset signal input at $\overline{\text{RES}}$ pin (Initial value) • Cleared by reading WRST when WRST = 1, then writing 0 in WRST
1	[Setting condition] Set when TCNT overflow generates a reset signal during watchdog timer operation

Bit 6—Reserved: Do not set to 1.

Bits 5 to 0—Reserved: Read-only bits, always read as 1.

12.2.4 Notes on Register Access

The watchdog timer's TCNT, TCSR, and RSTCSR registers differ from other registers in being more difficult to write. The procedures for writing and reading these registers are given below.

Writing to TCNT and TCSR: These registers must be written by a word transfer instruction. They cannot be written by byte instructions. Figure 12.2 shows the format of data written to TCNT and TCSR. TCNT and TCSR both have the same write address. The write data must be contained in the lower byte of the written word. The upper byte must contain H'5A (password for TCNT) or H'A5 (password for TCSR). This transfers the write data from the lower byte to TCNT or TCSR.

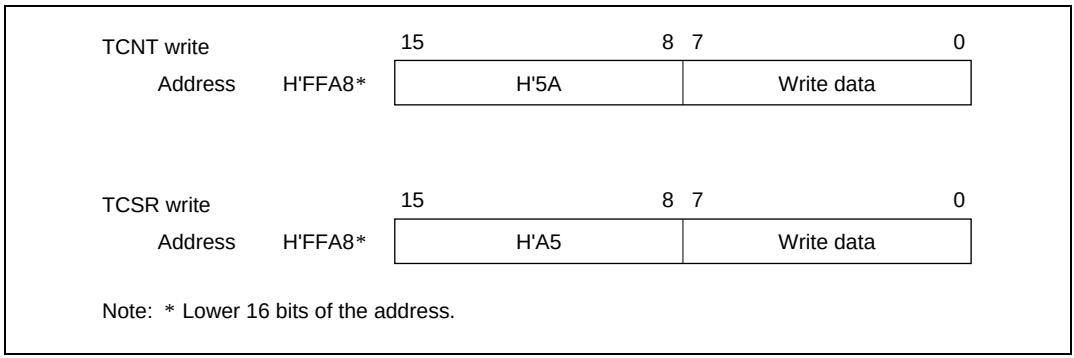


Figure 12.2 Format of Data Written to TCNT and TCSR

Writing to RSTCSR: RSTCSR must be written by a word transfer instruction. It cannot be written by byte transfer instructions. Figure 12.3 shows the format of data written to RSTCSR. To write 0 in the WRST bit, the write data must have H'A5 in the upper byte and H'00 in the lower byte. The H'00 in the lower byte clears the WRST bit in RSTCSR to 0.

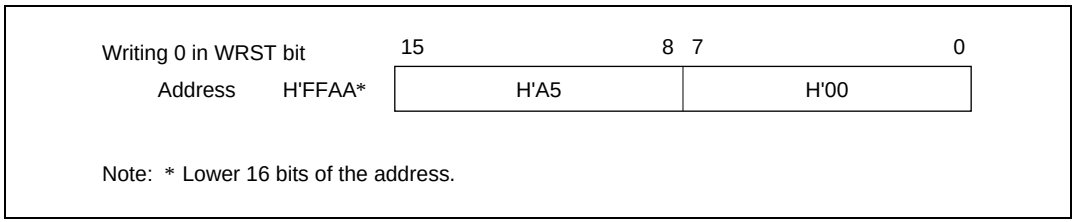

Figure 12.3 Format of Data Written to RSTCSR

Reading TCNT, TCSR, and RSTCSR: These registers are read like other registers. Byte access instructions can be used. The read addresses are H'FFA8 for TCSR, H'FFA9 for TCNT, and H'FFAB for RSTCSR, as listed in table 12.2.

Table 12.2 Read Addresses of TCNT, TCSR, and RSTCSR

Address*	Register
H'FFA8	TCSR
H'FFA9	TCNT
H'FFAB	RSTCSR

Note: * Lower 16 bits of the address.

12.3 Operation

Operations when the WDT is used as a watchdog timer and as an interval timer are described below.

12.3.1 Watchdog Timer Operation

Figure 12.4 illustrates watchdog timer operation. To use the WDT as a watchdog timer, set the WT/$\overline{IT}$ and TME bits to 1 in TCSR. Software must prevent TCNT overflow by rewriting the TCNT value (normally by writing H'00) before overflow occurs. If TCNT fails to be rewritten and overflows due to a system crash etc., the chip is internally reset for a duration of 518 states.

A reset generated by the WDT has the same vector as a reset generated by input at the $\overline{RES}$ pin. Software can distinguish a $\overline{RES}$ reset from a watchdog reset by checking the WRST bit in RSTCSR.

If a $\overline{RES}$ reset and a watchdog reset occur simultaneously, the $\overline{RES}$ reset takes priority.

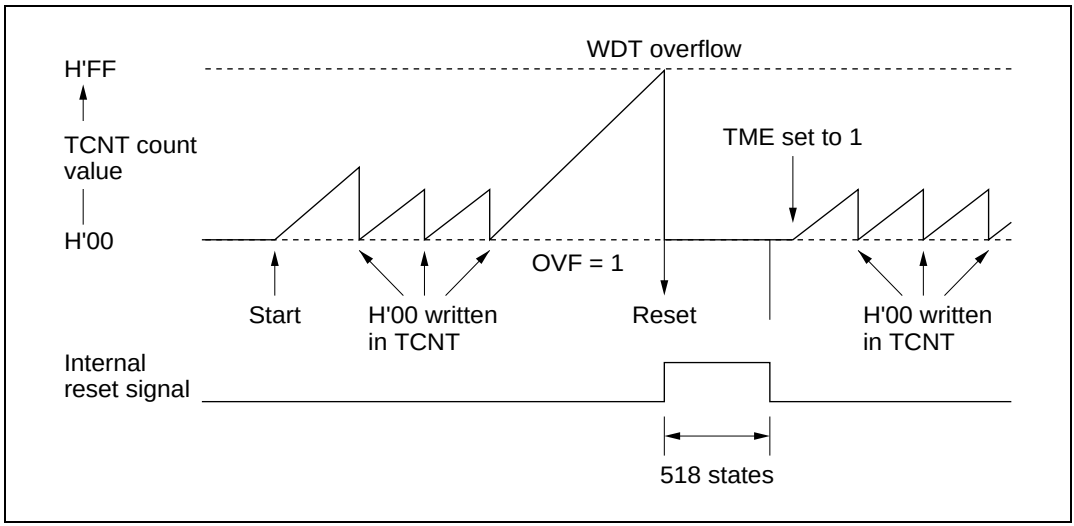

Figure 12.4 Watchdog Timer Operation

12.3.2 Interval Timer Operation

Figure 12.5 illustrates interval timer operation. To use the WDT as an interval timer, clear bit WT/$\overline{IT}$ to 0 and set bit TME to 1 in TCSR. An interval timer interrupt request is generated at each TCNT overflow. This function can be used to generate interval timer interrupts at regular intervals.

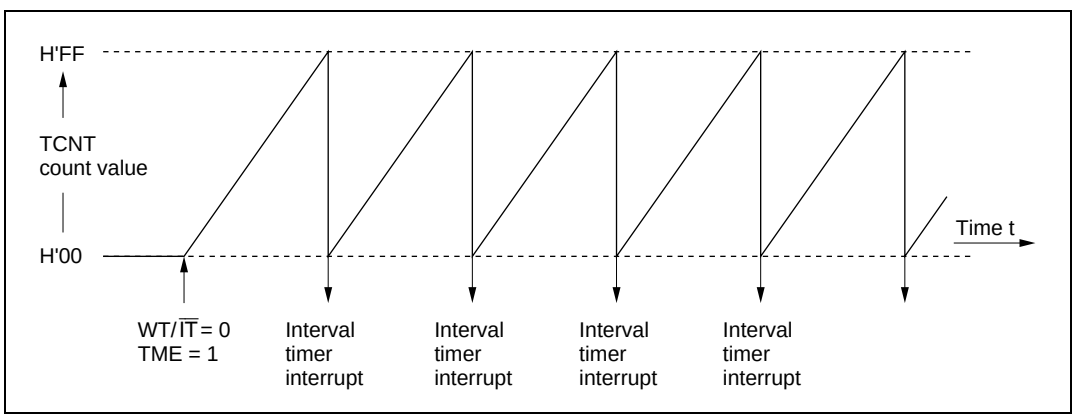

Figure 12.5 Interval Timer Operation

12.3.3 Timing of Setting of Overflow Flag (OVF)

Figure 12.6 shows the timing of setting of the OVF flag in TCSR. The OVF flag is set to 1 when TCNT overflows. At the same time, a reset signal is generated in watchdog timer operation, or an interval timer interrupt is generated in interval timer operation.

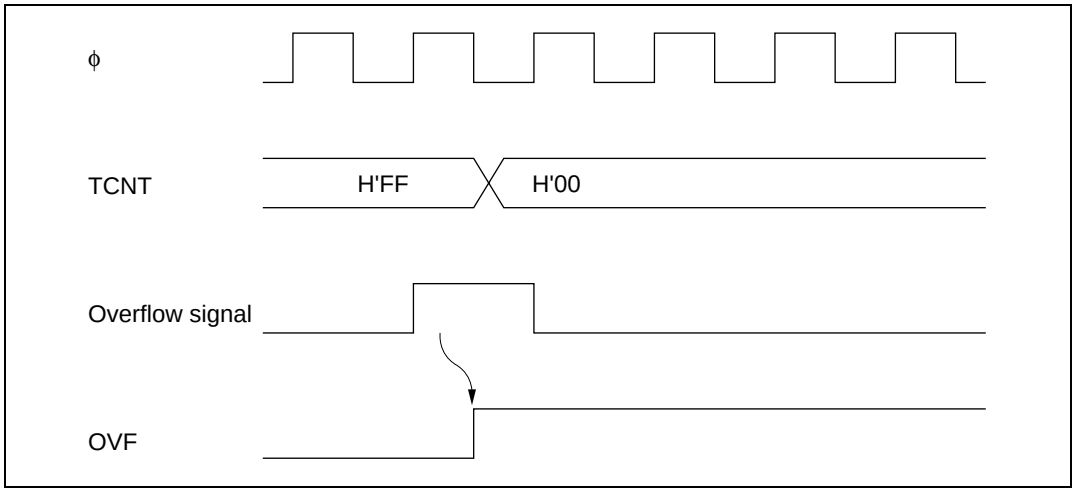

Figure 12.6 Timing of Setting of OVF

12.3.4 Timing of Setting of Watchdog Timer Reset Bit (WRST)

The WRST bit in RSTCSR is valid when bits WT/$\overline{IT}$ and TME are both set to 1 in TCSR.

Figure 12.7 shows the timing of setting of WRST and the internal reset timing. The WRST bit is set to 1 when TCNT overflows and OVF is set to 1. At the same time an internal reset signal is generated for the entire chip. This internal reset signal clears OVF to 0, but the WRST bit remains set to 1. The reset routine must therefore clear the WRST bit.

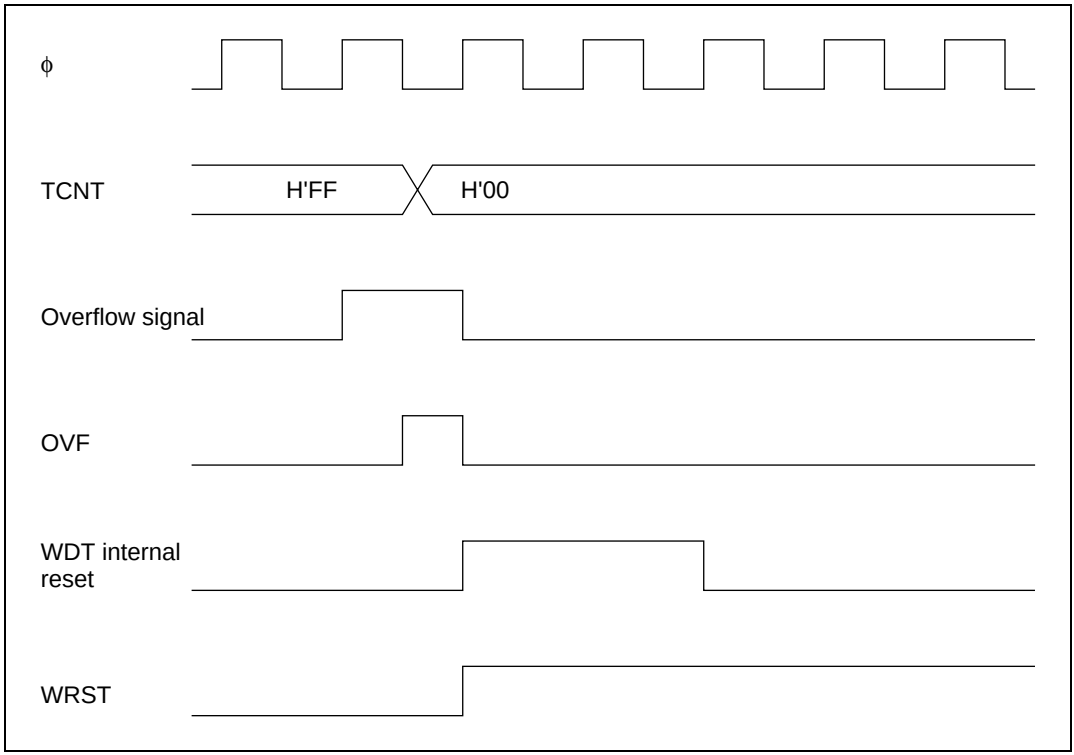

Figure 12.7 Timing of Setting of WRST Bit and Internal Reset

12.4 Interrupts

During interval timer operation, an overflow generates an interval timer interrupt (WOVI). The interval timer interrupt is requested whenever the OVF bit is set to 1 in TCSR.

12.5 Usage Notes

Contention between TCNT Write and Increment: If a timer counter clock pulse is generated during the T_3 state of a write cycle to TCNT, the write takes priority and the timer count is not incremented. See figure 12.8.

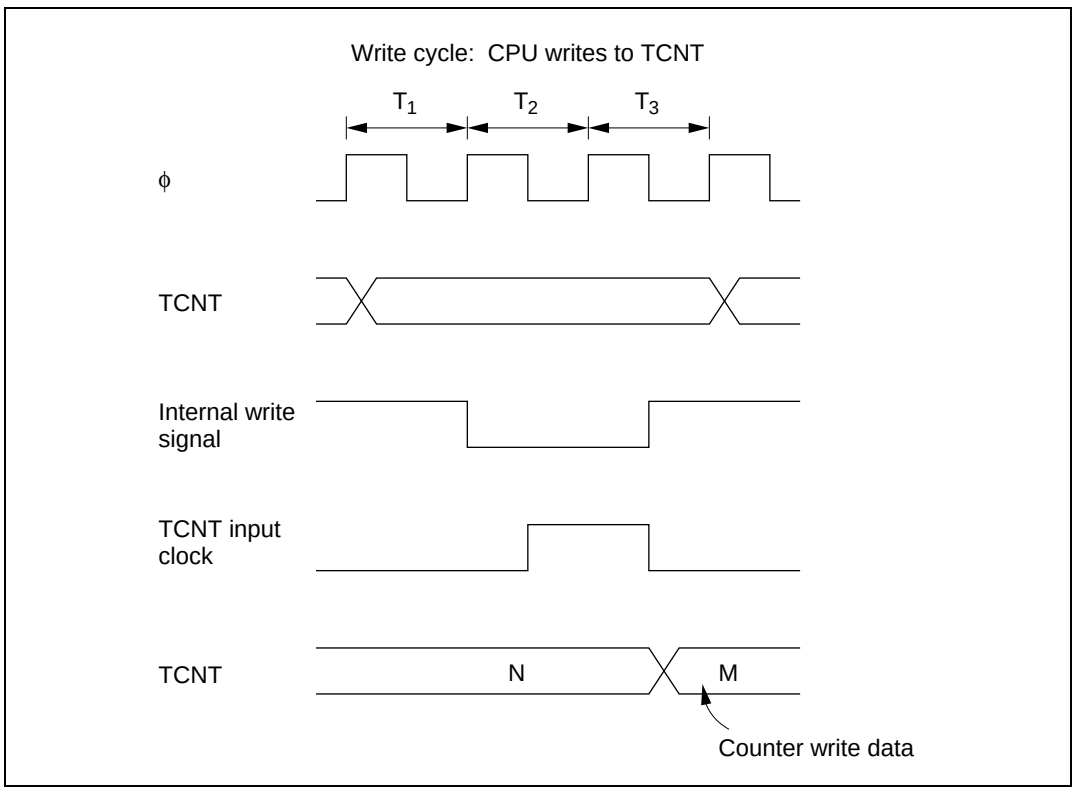

Figure 12.8 Contention between TCNT Write and Increment

Changing CKS2 to CKS0 Values: Halt TCNT by clearing the TME bit to 0 in TCSR before changing the values of bits CKS2 to CKS0.

Section 13 Serial Communication Interface

13.1 Overview

The H8/3052BF has a serial communication interface (SCI) with two independent channels. The two channels are functionally identical. The SCI can communicate in asynchronous or synchronous mode. It also has a multiprocessor communication function for serial communication among two or more processors.

When the SCI is not used, it can be halted to conserve power. Each SCI channel can be halted independently. For details see section 20.6, Module Standby Function.

Channel 0 (SCI0) also has a smart card interface function conforming to the ISO/IEC7816-3 (Identification Card) standard. This function supports serial communication with a smart card. For details, see section 14, Smart Card Interface.

13.1.1 Features

SCI features are listed below.

- Selection of asynchronous or synchronous mode for serial communication
  - — Asynchronous mode

    Serial data communication is synchronized one character at a time. The SCI can communicate with a universal asynchronous receiver/transmitter (UART), asynchronous communication interface adapter (ACIA), or other chip that employs standard asynchronous serial communication. It can also communicate with two or more other processors using the multiprocessor communication function. There are twelve selectable serial data communication formats.
- Data length: 7 or 8 bits
- Stop bit length: 1 or 2 bits
- Parity bit: even, odd, or none
- Multiprocessor bit: 1 or 0
- Receive error detection: parity, overrun, and framing errors
- Break detection: by reading the RxD level directly when a framing error occurs
  - — Synchronous mode

    Serial data communication is synchronized with a clock signal. The SCI can communicate with other chips having a synchronous communication function. There is one serial data communication format.

  - Data length: 8 bits
  - Receive error detection: overrun errors
- Full duplex communication

  The transmitting and receiving sections are independent, so the SCI can transmit and receive simultaneously. The transmitting and receiving sections are both double-buffered, so serial data can be transmitted and received continuously.
- Built-in baud rate generator with selectable bit rates
- Selectable transmit/receive clock sources: internal clock from baud rate generator, or external clock from the SCK pin.
- Four types of interrupts

  Transmit-data-empty, transmit-end, receive-data-full, and receive-error interrupts are requested independently. The transmit-data-empty and receive-data-full interrupts from SCI0 can activate the DMA controller (DMAC) to transfer data.

13.1.2 Block Diagram

Figure 13.1 shows a block diagram of the SCI.

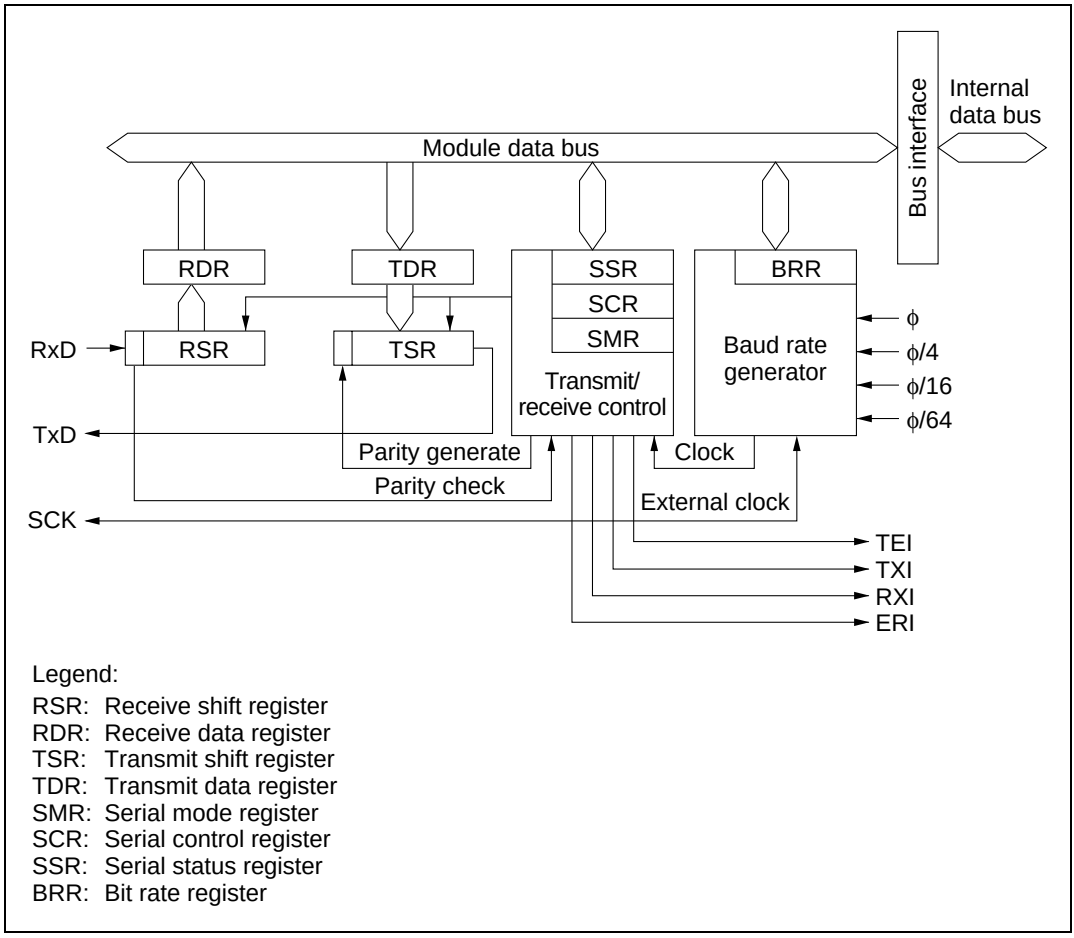

Figure 13.1 SCI Block Diagram

13.1.3 Pin Configuration

The SCI has serial pins for each channel as listed in table 13.1.

Table 13.1 SCI Pins

Channel	Name	Abbreviation	I/O	Function
0	Serial clock pin	SCK_0	Input/output	SCI_0 clock input/output
	Receive data pin	RxD_0	Input	SCI_0 receive data input
	Transmit data pin	TxD_0	Output	SCI_0 transmit data output
1	Serial clock pin	SCK_1	Input/output	SCI_1 clock input/output
	Receive data pin	RxD_1	Input	SCI_1 receive data input
	Transmit data pin	TxD_1	Output	SCI_1 transmit data output

13.1.4 Register Configuration

The SCI has internal registers as listed in table 13.2. These registers select asynchronous or synchronous mode, specify the data format and bit rate, and control the transmitter and receiver sections.

Table 13.2 Registers

Channel	Address*1	Name	Abbreviation	R/W	Initial Value
0	H'FFB0	Serial mode register	SMR	R/W	H'00
	H'FFB1	Bit rate register	BRR	R/W	H'FF
	H'FFB2	Serial control register	SCR	R/W	H'00
	H'FFB3	Transmit data register	TDR	R/W	H'FF
	H'FFB4	Serial status register	SSR	R/(W)*2	H'84
	H'FFB5	Receive data register	RDR	R	H'00
1	H'FFB8	Serial mode register	SMR	R/W	H'00
	H'FFB9	Bit rate register	BRR	R/W	H'FF
	H'FFBA	Serial control register	SCR	R/W	H'00
	H'FFBB	Transmit data register	TDR	R/W	H'FF
	H'FFBC	Serial status register	SSR	R/(W)*2	H'84
	H'FFBD	Receive data register	RDR	R	H'00

Notes: 1. Lower 16 bits of the address.
2. Only 0 can be written, to clear flags.

13.2 Register Descriptions

13.2.1 Receive Shift Register (RSR)

RSR is the register that receives serial data.

Bit	7	6	5	4	3	2	1	0
Read/Write	—	—	—	—	—	—	—	—

The SCI loads serial data input at the RxD pin into RSR in the order received, LSB (bit 0) first, thereby converting the data to parallel data. When 1 byte has been received, it is automatically transferred to RDR. The CPU cannot read or write RSR directly.

13.2.2 Receive Data Register (RDR)

RDR is the register that stores received serial data.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

When the SCI finishes receiving 1 byte of serial data, it transfers the received data from RSR into RDR for storage. RSR is then ready to receive the next data. This double buffering allows data to be received continuously.

RDR is a read-only register. Its contents cannot be modified by the CPU. RDR is initialized to H'00 by a reset and in standby mode.

13.2.3 Transmit Shift Register (TSR)

TSR is the register that transmits serial data.

Bit	7	6	5	4	3	2	1	0
Read/Write	—	—	—	—	—	—	—	—

The SCI loads transmit data from TDR into TSR, then transmits the data serially from the TxD pin, LSB (bit 0) first. After transmitting one data byte, the SCI automatically loads the next transmit data from TDR into TSR and starts transmitting it. If the TDRE flag is set to 1 in SSR, however, the SCI does not load the TDR contents into TSR. The CPU cannot read or write TSR directly.

13.2.4 Transmit Data Register (TDR)

TDR is an 8-bit register that stores data for serial transmission.

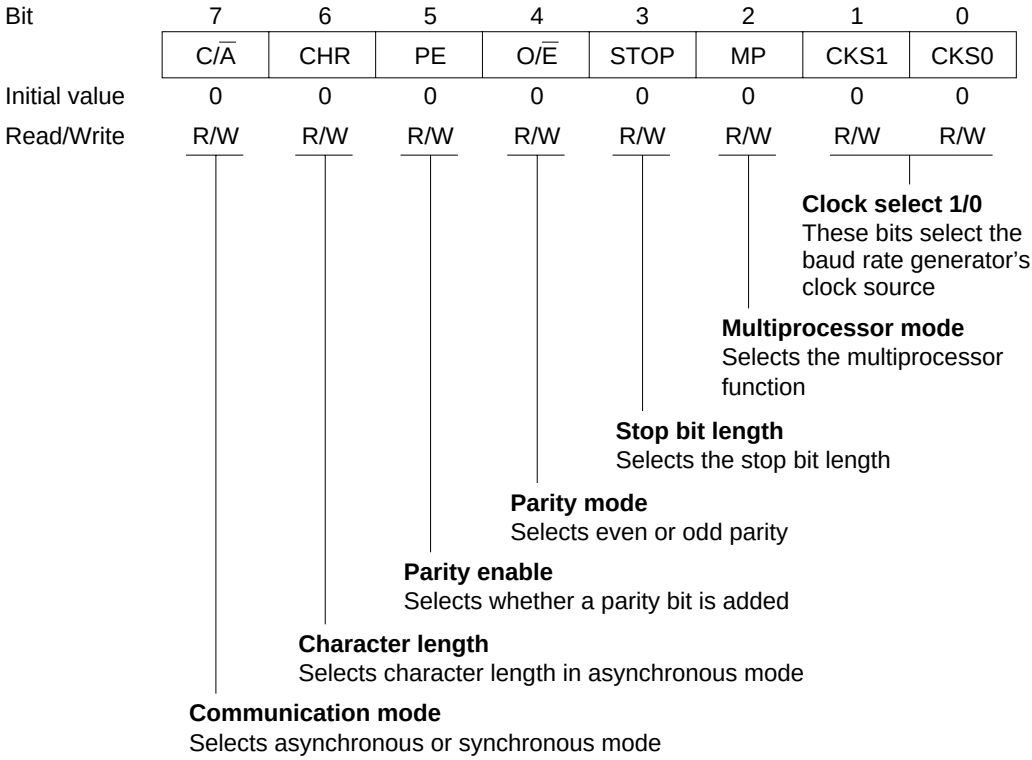
Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When the SCI detects that TSR is empty, it moves transmit data written in TDR from TDR into TSR and starts serial transmission. Continuous serial transmission is possible by writing the next transmit data in TDR during serial transmission from TSR.

The CPU can always read and write TDR. TDR is initialized to H'FF by a reset and in standby mode.

13.2.5 Serial Mode Register (SMR)

SMR is an 8-bit register that specifies the SCI serial communication format and selects the clock source for the baud rate generator.



The CPU can always read and write SMR. SMR is initialized to H'00 by a reset and in standby mode.

Bit 7—Communication Mode (C/$\overline{A}$): Selects whether the SCI operates in asynchronous or synchronous mode.

Bit 7: C/$\overline{A}$	Description	
0	Asynchronous mode	(Initial value)
1	Synchronous mode	

Bit 6—Character Length (CHR): Selects 7-bit or 8-bit data length in asynchronous mode. In synchronous mode the data length is 8 bits regardless of the CHR setting.

Bit 6: CHR	Description	
0	8-bit data	(Initial value)
1	7-bit data*	

Note: * When 7-bit data is selected, the MSB (bit 7) in TDR is not transmitted.

Bit 5—Parity Enable (PE): In asynchronous mode, this bit enables or disables the addition of a parity bit to transmit data, and the checking of the parity bit in receive data. In synchronous mode the parity bit is neither added nor checked, regardless of the PE setting.

Bit 5: PE	Description	
0	Parity bit not added or checked	(Initial value)
1	Parity bit added and checked*	

Note: * When PE is set to 1, an even or odd parity bit is added to transmit data according to the even or odd parity mode selected by the O/$\overline{E}$ bit, and the parity bit in receive data is checked to see that it matches the even or odd mode selected by the O/$\overline{E}$ bit.

Bit 4—Parity Mode (O/$\overline{E}$): Selects even or odd parity. The O/$\overline{E}$ bit setting is valid in asynchronous mode when the PE bit is set to 1 to enable the adding and checking of a parity bit. The O/$\overline{E}$ setting is ignored in synchronous mode, or when parity adding and checking is disabled in asynchronous mode.

Bit 4: O/$\overline{E}$	Description	
0	Even parity*1	(Initial value)
1	Odd parity*2	

Notes: 1. When even parity is selected, the parity bit added to transmit data makes an even number of 1s in the transmitted character and parity bit combined. Receive data must have an even number of 1s in the received character and parity bit combined.

2. When odd parity is selected, the parity bit added to transmit data makes an odd number of 1s in the transmitted character and parity bit combined. Receive data must have an odd number of 1s in the received character and parity bit combined.

Bit 3—Stop Bit Length (STOP): Selects one or two stop bits in asynchronous mode. This setting is used only in asynchronous mode. In synchronous mode no stop bit is added, so the STOP bit setting is ignored.

Bit 3: STOP	Description	
0	One stop bit*1	(Initial value)
1	Two stop bits*2	

Notes: 1. One stop bit (with value 1) is added at the end of each transmitted character.
2. Two stop bits (with value 1) are added at the end of each transmitted character.

In receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1 it is treated as a stop bit. If the second stop bit is 0 it is treated as the start bit of the next incoming character.

Bit 2—Multiprocessor Mode (MP): Selects a multiprocessor format. When a multiprocessor format is selected, parity settings made by the PE and O/$\overline{E}$ bits are ignored. The MP bit setting is valid only in asynchronous mode. It is ignored in synchronous mode.

For further information on the multiprocessor communication function, see section 13.3.3, Multiprocessor Communication.

Bit 2: MP	Description	
0	Multiprocessor function disabled	(Initial value)
1	Multiprocessor format selected	

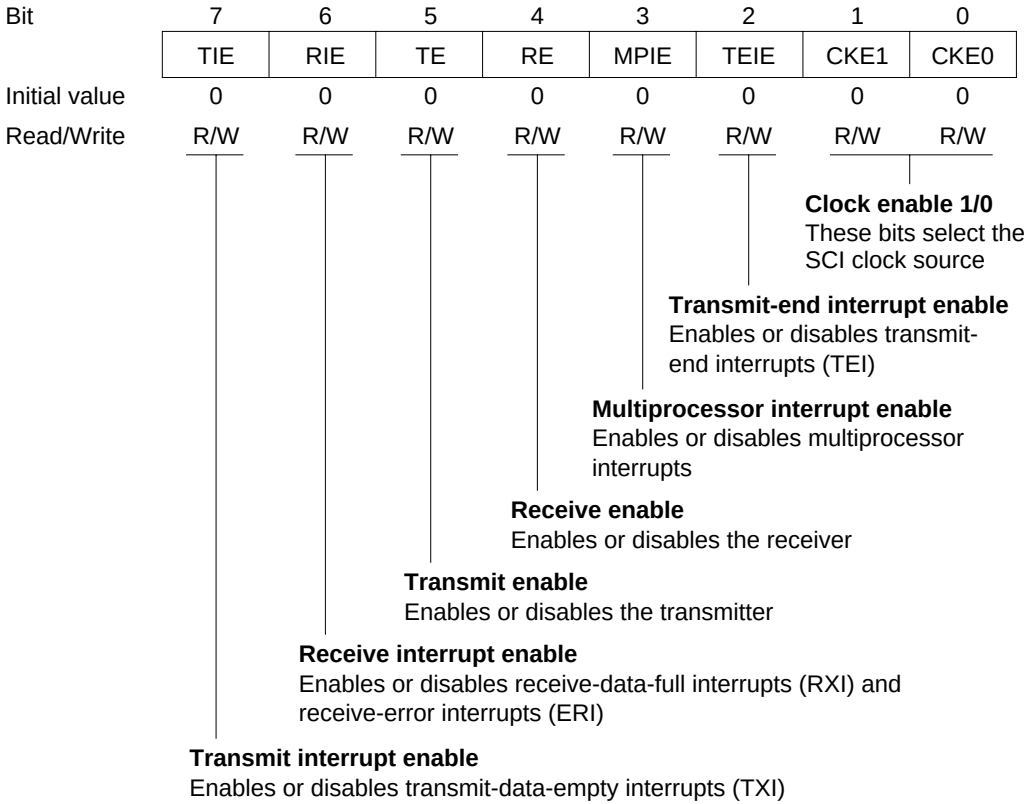
Bits 1 and 0—Clock Select 1 and 0 (CKS1/0): These bits select the clock source of the on-chip baud rate generator. Four clock sources are available: ϕ, ϕ/4, ϕ/16, and ϕ/64.

For the relationship between the clock source, bit rate register setting, and baud rate, see section 13.2.8, Bit Rate Register (BRR).

Bit 1: CKS1	Bit 0: CKS0	Description	
0	0	ϕ	(Initial value)
	1	ϕ/4	
1	0	ϕ/16	
	1	ϕ/64	

13.2.6 Serial Control Register (SCR)

SCR enables the SCI transmitter and receiver, enables or disables serial clock output in asynchronous mode, enables or disables interrupts, and selects the transmit/receive clock source.



The CPU can always read and write SCR. SCR is initialized to H'00 by a reset and in standby mode.

Bit 7—Transmit Interrupt Enable (TIE): Enables or disables the transmit-data-empty interrupt (TXI) requested when the TDRE flag in SSR is set to 1 due to transfer of serial transmit data from TDR to TSR.

Bit 7: TIE	Description	
0	Transmit-data-empty interrupt request (TXI) is disabled*	(Initial value)
1	Transmit-data-empty interrupt request (TXI) is enabled	

Note: * TXI interrupt requests can be cleared by reading the value 1 from the TDRE flag, then clearing it to 0; or by clearing the TIE bit to 0.

Bit 6—Receive Interrupt Enable (RIE): Enables or disables the receive-data-full interrupt (RXI) requested when the RDRF flag is set to 1 in SSR due to transfer of serial receive data from RSR to RDR; also enables or disables the receive-error interrupt (ERI).

Bit 6: RIE	Description
0	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are disabled* (Initial value)
1	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are enabled

Note: * RXI and ERI interrupt requests can be cleared by reading the value 1 from the RDRF, FER, PER, or ORER flag, then clearing it to 0; or by clearing the RIE bit to 0.

Bit 5—Transmit Enable (TE): Enables or disables the start of SCI serial transmitting operations.

Bit 5: TE	Description	
0	Transmitting disabled*1	(Initial value)
1	Transmitting enabled*2	

Notes: 1. The TDRE bit is locked at 1 in SSR.
2. In the enabled state, serial transmitting starts when the TDRE bit in SSR is cleared to 0 after writing of transmit data into TDR. Select the transmit format in SMR before setting the TE bit to 1.

Bit 4—Receive Enable (RE): Enables or disables the start of SCI serial receiving operations.

Bit 4: RE	Description	
0	Receiving disabled*1	(Initial value)
1	Receiving enabled*2	

Notes: 1. Clearing the RE bit to 0 does not affect the RDRF, FER, PER, and ORER flags. These flags retain their previous values.
2. In the enabled state, serial receiving starts when a start bit is detected in asynchronous mode, or serial clock input is detected in synchronous mode. Select the receive format in SMR before setting the RE bit to 1.

Bit 3—Multiprocessor Interrupt Enable (MPIE): Enables or disables multiprocessor interrupts. The MPIE setting is valid only in asynchronous mode, and only if the MP bit is set to 1 in SMR. The MPIE setting is ignored in synchronous mode or when the MP bit is cleared to 0.

Bit 3: MPIE	Description
0	Multiprocessor interrupts are disabled (normal receive operation) (Initial value) [Clearing conditions] • The MPIE bit is cleared to 0. • MPB = 1 in received data.
1	Multiprocessor interrupts are enabled* Receive-data-full interrupts (RXI), receive-error interrupts (ERI), and setting of the RDRF, FER, and ORER status flags in SSR are disabled until data with the multiprocessor bit set to 1 is received.

Note: * The SCI does not transfer receive data from RSR to RDR, does not detect receive errors, and does not set the RDRF, FER, and ORER flags in SSR. When it receives data in which MPB = 1, the SCI sets the MPB bit to 1 in SSR, automatically clears the MPIE bit to 0, enables RXI and ERI interrupts (if the RIE bit is set to 1 in SCR), and allows the FER and ORER flags to be set.

Bit 2—Transmit-End Interrupt Enable (TEIE): Enables or disables the transmit-end interrupt (TEI) requested if TDR does not contain new transmit data when the MSB is transmitted.

Bit 2: TEIE	Description	
0	Transmit-end interrupt requests (TEI) are disabled*	(Initial value)
1	Transmit-end interrupt requests (TEI) are enabled*	

Note: * TEI interrupt requests can be cleared by reading the value 1 from the TDRE flag in SSR, then clearing the TDRE flag to 0, thereby also clearing the TEND flag to 0; or by clearing the TEIE bit to 0.

Bits 1 and 0—Clock Enable 1 and 0 (CKE1/0): These bits select the SCI clock source and enable or disable clock output from the SCK pin. Depending on the settings of CKE1 and CKE0, the SCK pin can be used for generic input/output, serial clock output, or serial clock input.

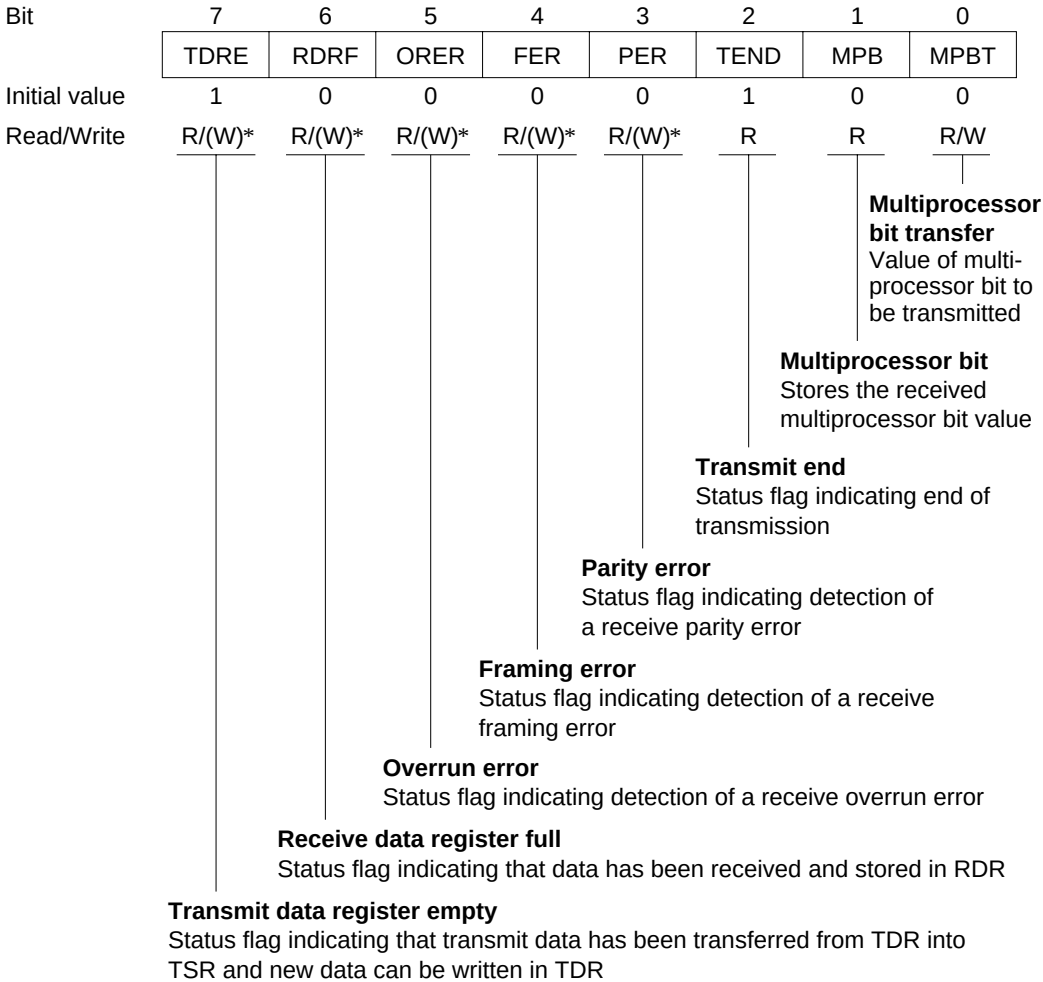
The CKE0 setting is valid only in asynchronous mode, and only when the SCI is internally clocked (CKE1 = 0). The CKE0 setting is ignored in synchronous mode, or when an external clock source is selected (CKE1 = 1). Select the SCI operating mode in SMR before setting the CKE1 and CKE0 bits. For further details on selection of the SCI clock source, see table 13.9 in section 13.3, Operation.

Bit 1: CKE1	Bit 0: CKE0	Description	
0	0	Asynchronous mode	Internal clock, SCK pin available for generic input/output*1
		Synchronous mode	Internal clock, SCK pin used for serial clock output*1
	1	Asynchronous mode	Internal clock, SCK pin used for clock output*2
		Synchronous mode	Internal clock, SCK pin used for serial clock output
1	0	Asynchronous mode	External clock, SCK pin used for clock input*3
		Synchronous mode	External clock, SCK pin used for serial clock input
	1	Asynchronous mode	External clock, SCK pin used for clock input*3
		Synchronous mode	External clock, SCK pin used for serial clock input

Notes: 1. Initial value
2. The output clock frequency is the same as the bit rate.
3. The input clock frequency is 16 times the bit rate.

13.2.7 Serial Status Register (SSR)

SSR is an 8-bit register containing multiprocessor bit values, and status flags that indicate SCI operating status.



Note: * Only 0 can be written, to clear the flag.

The CPU can always read and write SSR, but cannot write 1 in the TDRE, RDRF, ORER, PER, and FER flags. These flags can be cleared to 0 only if they have first been read while set to 1. The TEND and MPB flags are read-only bits that cannot be written.

SSR is initialized to H'84 by a reset and in standby mode.

Bit 7—Transmit Data Register Empty (TDRE): Indicates that the SCI has loaded transmit data from TDR into TSR and the next serial transmit data can be written in TDR.

Bit 7: TDRE	Description
0	TDR contains valid transmit data [Clearing conditions] • Software reads TDRE while it is set to 1, then writes 0. • The DMAC writes data in TDR.
1	TDR does not contain valid transmit data (Initial value) [Setting conditions] • The chip is reset or enters standby mode. • The TE bit in SCR is cleared to 0. • TDR contents are loaded into TSR, so new data can be written in TDR.

Bit 6—Receive Data Register Full (RDRF): Indicates that RDR contains new receive data.

Bit 6: RDRF	Description
0	RDR does not contain new receive data (Initial value) [Clearing conditions] • The chip is reset or enters standby mode. • Software reads RDRF while it is set to 1, then writes 0. • The DMAC reads data from RDR.
1	RDR contains new receive data [Setting condition] When serial data is received normally and transferred from RSR to RDR.

Note: The RDR contents and RDRF flag are not affected by detection of receive errors or by clearing of the RE bit to 0 in SCR. They retain their previous values. If the RDRF flag is still set to 1 when reception of the next data ends, an overrun error occurs and receive data is lost.

Bit 5—Overrun Error (ORER): Indicates that data reception ended abnormally due to an overrun error.

Bit 5: ORER	Description	
0	Receiving is in progress or has ended normally [Clearing conditions] • The chip is reset or enters standby mode. • Software reads ORER while it is set to 1, then writes 0.	(Initial value)*1
1	A receive overrun error occurred*2 [Setting condition] Reception of the next serial data ends when RDRF = 1.	

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the ORER flag, which retains its previous value.
2. RDR continues to hold the receive data before the overrun error, so subsequent receive data is lost. Serial receiving cannot continue while the ORER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 4—Framing Error (FER): Indicates that data reception ended abnormally due to a framing error in asynchronous mode.

Bit 4: FER	Description	
0	Receiving is in progress or has ended normally [Clearing conditions] • The chip is reset or enters standby mode. • Software reads FER while it is set to 1, then writes 0.	(Initial value)*1
1	A receive framing error occurred*2 [Setting condition] The stop bit at the end of receive data is checked and found to be 0.	

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the FER flag, which retains its previous value.
2. When the stop bit length is 2 bits, only the first bit is checked. The second stop bit is not checked. When a framing error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the FER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 3—Parity Error (PER): Indicates that data reception ended abnormally due to a parity error in asynchronous mode.

Bit 3: PER	Description
0	Receiving is in progress or has ended normally[*1] (Initial value) [Clearing conditions] • The chip is reset or enters standby mode. • Software reads PER while it is set to 1, then writes 0.
1	A receive parity error occurred[*2] [Setting condition] The number of 1s in receive data, including the parity bit, does not match the even or odd parity setting of O/$\overline{E}$ in SMR.

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the PER flag, which retains its previous value.
2. When a parity error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the PER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 2—Transmit End (TEND): Indicates that when the last bit of a serial character was transmitted TDR did not contain new transmit data, so transmission has ended. The TEND flag is a read-only bit and cannot be written.

Bit 2: TEND	Description
0	Transmission is in progress [Clearing conditions] • Software reads TDRE while it is set to 1, then writes 0 in the TDRE flag. • The DMAC writes data in TDR.
1	End of transmission (Initial value) [Setting conditions] • The chip is reset or enters standby mode. • The TE bit is cleared to 0 in SCR. • TDRE is 1 when the last bit of a serial character is transmitted.

Bit 1—Multiprocessor Bit (MPB): Stores the value of the multiprocessor bit in receive data when a multiprocessor format is used in asynchronous mode. MPB is a read-only bit and cannot be written.

Bit 1: MPB	Description	
0	Multiprocessor bit value in receive data is 0*	(Initial value)
1	Multiprocessor bit value in receive data is 1	

Note: * If the RE bit is cleared to 0 when a multiprocessor format is selected, MPB retains its previous value.

Bit 0—Multiprocessor Bit Transfer (MPBT): Stores the value of the multiprocessor bit added to transmit data when a multiprocessor format is selected for transmitting in asynchronous mode. The MPBT setting is ignored in synchronous mode, when a multiprocessor format is not selected, or when the SCI is not transmitting.

Bit 0: MPBT	Description	
0	Multiprocessor bit value in transmit data is 0	(Initial value)
1	Multiprocessor bit value in transmit data is 1	

13.2.8 Bit Rate Register (BRR)

BRR is an 8-bit register that, together with the CKS1 and CKS0 bits in SMR that select the baud rate generator clock source, determines the serial communication bit rate.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The CPU can always read and write BRR. BRR is initialized to H'FF by a reset and in standby mode. The two SCI channels have independent baud rate generator control, so different values can be set in the two channels.

Table 13.3 shows examples of BRR settings in asynchronous mode. Table 13.4 shows examples of BRR settings in synchronous mode.

Table 13.3 Examples of Bit Rates and BRR Settings in Asynchronous Mode

	ϕ (MHz)

Legend:

Blank: No setting available

—: Setting possible, but error occurs

*: Continuous transmit/receive not possible

Note: Settings with an error of 1% or less are recommended.

The BRR setting is calculated as follows:

Asynchronous mode:

$$N = \frac{\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Synchronous mode:

$$N = \frac{\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bits/s)
N: BRR setting for baud rate generator ($0 \leq N \leq 255$)
ϕ: System clock frequency (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3)
(For the clock sources and values of n, see the following table.)

		SMR Settings	
n	**Clock Source**	**CKS1**	**CKS0**
0	ϕ	0	0
1	ϕ/4	0	1
2	ϕ/16	1	0
3	ϕ/64	1	1

The bit rate error in asynchronous mode is calculated as follows.

$$\text{Error (\%)} = \left\{ \frac{\phi \times 10^6}{(N + 1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

Table 13.5 indicates the maximum bit rates in asynchronous mode for various system clock frequencies. Tables 13.6 and 13.7 indicate the maximum bit rates with external clock input.

13.3 Operation

13.3.1 Overview

The SCI has an asynchronous mode in which characters are synchronized individually, and a synchronous mode in which communication is synchronized with clock pulses. Serial communication is possible in either mode. Asynchronous or synchronous mode and the communication format are selected in SMR, as shown in table 13.8. The SCI clock source is selected by the C/$\overline{A}$ bit in SMR and the CKE1 and CKE0 bits in SCR, as shown in table 13.9.

Asynchronous Mode

- Data length is selectable: 7 or 8 bits.
- Parity and multiprocessor bits are selectable. So is the stop bit length (1 or 2 bits). These selections determine the communication format and character length.
- In receiving, it is possible to detect framing errors, parity errors, overrun errors, and the break state.
- An internal or external clock can be selected as the SCI clock source.
  - When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and can output a serial clock signal with a frequency matching the bit rate.
  - When an external clock is selected, the external clock input must have a frequency 16 times the bit rate. (The on-chip baud rate generator is not used.)

Synchronous Mode

- The communication format has a fixed 8-bit data length.
- In receiving, it is possible to detect overrun errors.
- An internal or external clock can be selected as the SCI clock source.
  - When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and outputs a serial clock signal to external devices.
  - When an external clock is selected, the SCI operates on the input serial clock. The on-chip baud rate generator is not used.

Table 13.8 SMR Settings and Serial Communication Formats

SMR Settings						SCI Communication Format			
Bit 7: C/$\overline{A}$	Bit 6: CHR	Bit 2: MP	Bit 5: PE	Bit 3: STOP	Mode	Data Length	Multi-processor Bit	Parity Bit	Stop Bit Length
0	0	0	0	0	Asynchronous mode	8-bit data	Absent	Absent	1 bit
				1					2 bits
			1	0				Present	1 bit
				1					2 bits
	1		0	0		7-bit data		Absent	1 bit
				1					2 bits
			1	0				Present	1 bit
				1					2 bits
	0	1	—	0	Asynchronous mode (multi-processor format)	8-bit data	Present	Absent	1 bit
				1					2 bits
	1			0		7-bit data			1 bit
				1					2 bits
1	—	—	—	—	Synchronous mode	8-bit data	Absent		None

Table 13.9 SMR and SCR Settings and SCI Clock Source Selection

SMR	SCR Settings			SCI Transmit/Receive Clock	
Bit 7: C/$\overline{A}$	Bit 1: CKE1	Bit 0: CKE0	Mode	Clock Source	SCK Pin Function
0	0	0	Asynchronous mode	Internal	SCI does not use the SCK pin
		1			Outputs a clock with frequency matching the bit rate
	1	0		External	Inputs a clock with frequency 16 times the bit rate
		1			
1	0	0	Synchronous mode	Internal	Outputs the serial clock
		1			
	1	0		External	Inputs the serial clock
		1			

13.3.2 Operation in Asynchronous Mode

In asynchronous mode each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCI are independent, so full duplex communication is possible. The transmitter and receiver are both double buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmitting and receiving.

Figure 13.2 shows the general format of asynchronous serial communication. In asynchronous serial communication the communication line is normally held in the mark (high) state. The SCI monitors the line and starts serial communication when the line goes to the space (low) state, indicating a start bit. One serial character consists of a start bit (low), data (LSB first), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCI synchronizes at the falling edge of the start bit. The SCI samples each data bit on the eighth pulse of a clock with a frequency 16 times the bit rate. Receive data is latched at the center of each bit.

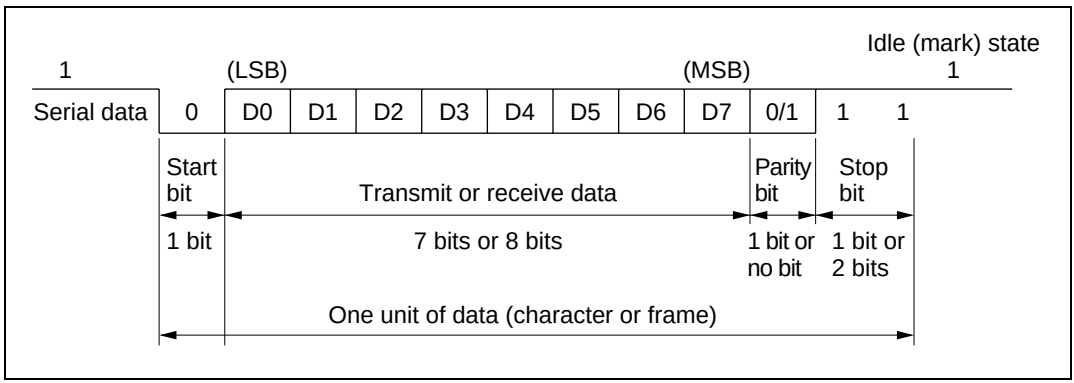

Figure 13.2 Data Format in Asynchronous Communication (Example: 8-Bit Data with Parity and 2 Stop Bits)

Communication Formats: Table 13.10 shows the 12 communication formats that can be selected in asynchronous mode. The format is selected by settings in SMR.

Table 13.10 Serial Communication Formats (Asynchronous Mode)

SMR Settings				Serial Communication Format and Frame Length											
CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	0	S	8-bit data								STOP		
0	0	0	1	S	8-bit data								STOP	STOP	
0	1	0	0	S	8-bit data								P	STOP	
0	1	0	1	S	8-bit data								P	STOP	STOP
1	0	0	0	S	7-bit data							STOP			
1	0	0	1	S	7-bit data							STOP	STOP		
1	1	0	0	S	7-bit data							P	STOP		
1	1	0	1	S	7-bit data							P	STOP	STOP	
0	—	1	0	S	8-bit data								MPB	STOP	
0	—	1	1	S	8-bit data								MPB	STOP	STOP
1	—	1	0	S	7-bit data							MPB	STOP		
1	—	1	1	S	7-bit data							MPB	STOP	STOP	

Legend:
S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multiprocessor bit

Clock: An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCI transmit/receive clock. The clock source is selected by the C/$\overline{A}$ bit in SMR and bits CKE1 and CKE0 in SCR. See table 13.9.

When an external clock is input at the SCK pin, it must have a frequency equal to 16 times the desired bit rate.

When the SCI operates on an internal clock, it can output a clock signal at the SCK pin. The frequency of this output clock is equal to the bit rate. The phase is aligned as in figure 13.3 so that the rising edge of the clock occurs at the center of each transmit data bit.

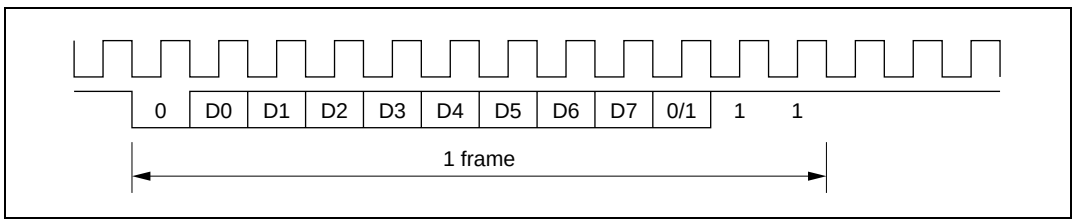

Figure 13.3 Phase Relationship between Output Clock and Serial Data (Asynchronous Mode)

Transmitting and Receiving Data

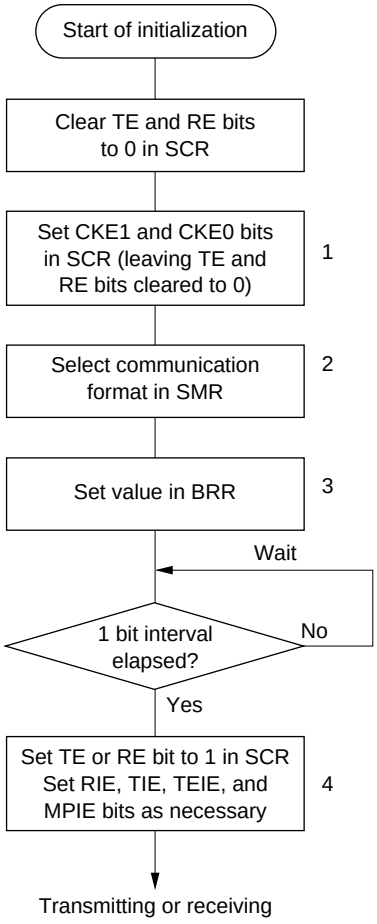
- SCI Initialization (Asynchronous Mode)

  Before transmitting or receiving, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

  When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 sets the TDRE flag to 1 and initializes TSR. Clearing RE to 0, however, does not initialize the RDRF, PER, FER, and ORER flags and RDR, which retain their previous contents.

  When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCI operation becomes unreliable if the clock is stopped.

  Figure 13.4 is a sample flowchart for initializing the SCI.

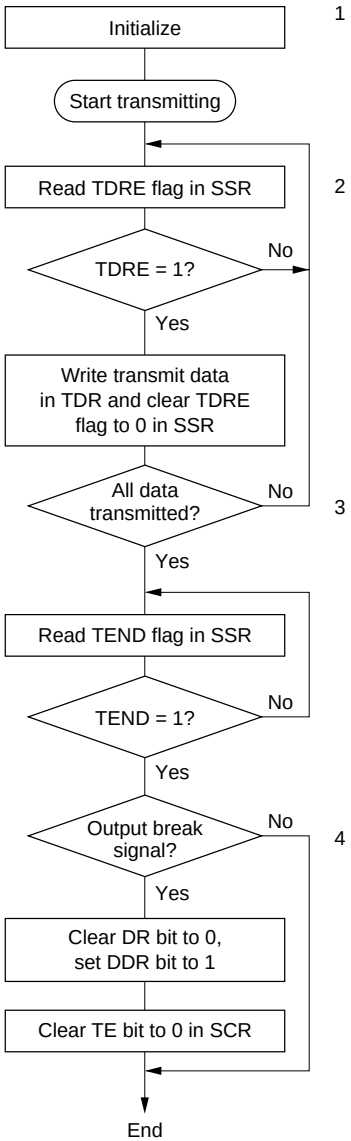


1. Select the clock source in SCR. Clear the RIE, TIE, TEIE, MPIE, TE, and RE bits to 0. If clock output is selected in asynchronous mode, clock output starts immediately after the setting is made in SCR.
2. Select the communication format in SMR.
3. Write the value corresponding to the bit rate in BRR. This step is not necessary when an external clock is used.
4. Wait for at least the interval required to transmit or receive 1 bit, then set the TE or RE bit to 1 in SCR. Set the RIE, TIE, TEIE, and MPIE bits as necessary. Setting the TE or RE bit enables the SCI to use the TxD or RxD pin.

Figure 13.4 Sample Flowchart for SCI Initialization

- Transmitting Serial Data (Asynchronous Mode)

  Figure 13.5 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.



1. SCI initialization: the transmit data output function of the TxD pin is selected automatically. After the TE bit is set to 1, one frame of 1 is output, then transmission is possible.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0. When the DMAC is activated by a transmit-data-empty interrupt request (TXI) to write data in TDR, the TDRE flag is checked and cleared automatically.
4. To output a break signal at the end of serial transmission: set the DDR bit to 1 and clear the DR bit to 0 (DDR and DR are I/O port registers), then clear the TE bit to 0 in SCR.

Figure 13.5 Sample Flowchart for Transmitting Serial Data

In transmitting serial data, the SCI operates as follows.

1. The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
2. After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

Serial transmit data is transmitted in the following order from the TxD pin:

a. Start bit: One 0 bit is output.
b. Transmit data: 7 or 8 bits are output, LSB first.
c. Parity bit or multiprocessor bit: One parity bit (even or odd parity) or one multiprocessor bit is output. Formats in which neither a parity bit nor a multiprocessor bit is output can also be selected.
d. Stop bit: One or two 1 bits (stop bits) are output.
e. Mark state: Output of 1 bits continues until the start bit of the next transmit data.

3. The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads new data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 13.6 shows an example of SCI transmit operation in asynchronous mode.

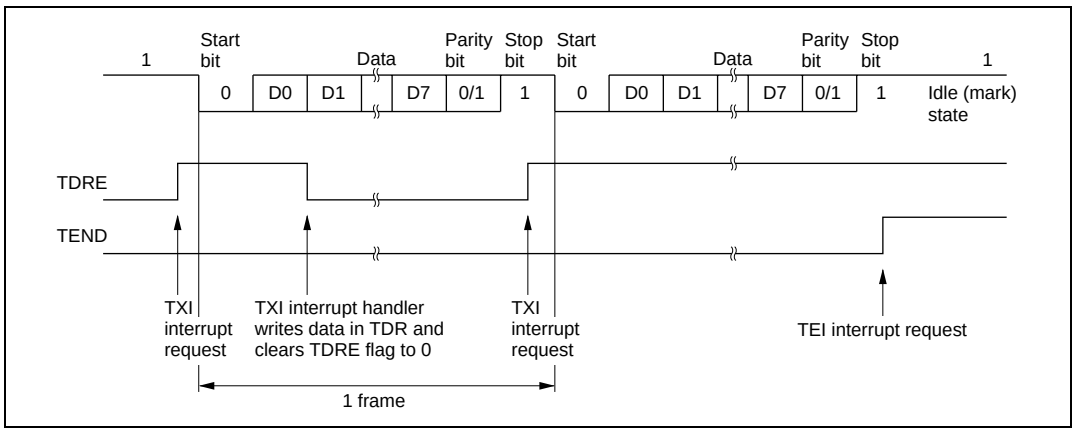


Figure 13.6 Example of SCI Transmit Operation in Asynchronous Mode (8-Bit Data with Parity and 1 Stop Bit)

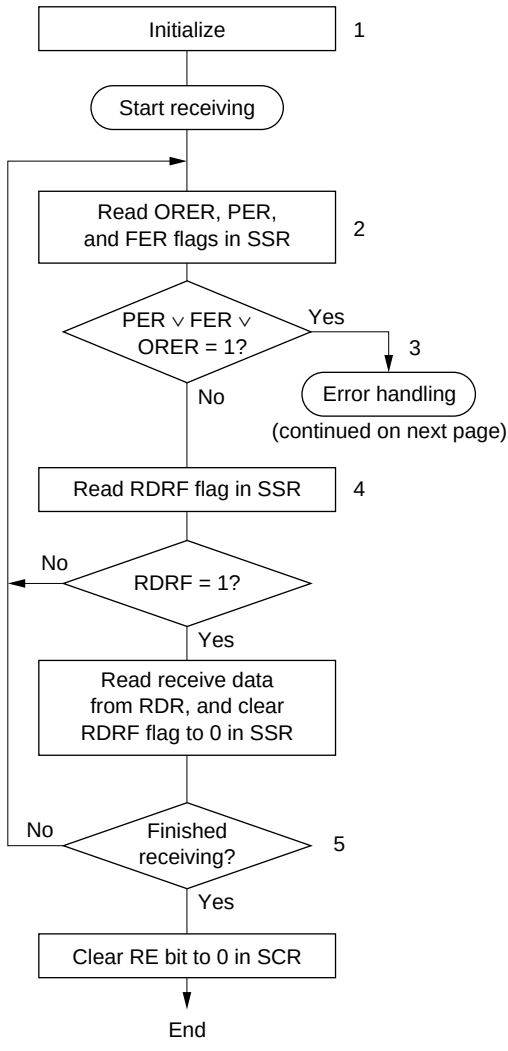
- Receiving Serial Data (Asynchronous Mode)

  Figure 13.7 shows a sample flowchart for receiving serial data and indicates the procedure to follow.



1. SCI initialization: the receive data function of the RxD pin is selected automatically.

2, 3. Receive error handling and break detection: if a receive error occurs, read the ORER, PER, and FER flags in SSR to identify the error. After executing the necessary error handling, clear the ORER, PER, and FER flags all to 0. Receiving cannot resume if any of the ORER, PER, and FER flags remains set to 1. When a framing error occurs, the RxD pin can be read to detect the break state.

4. SCI status check and receive data read: read SSR, check that RDRF is set to 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.

5. To continue receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the stop bit of the current frame is received. If the DMAC is activated by an RXI interrupt to read the RDR value, the RDRF flag is cleared automatically.

Figure 13.7 Sample Flowchart for Receiving Serial Data (1)

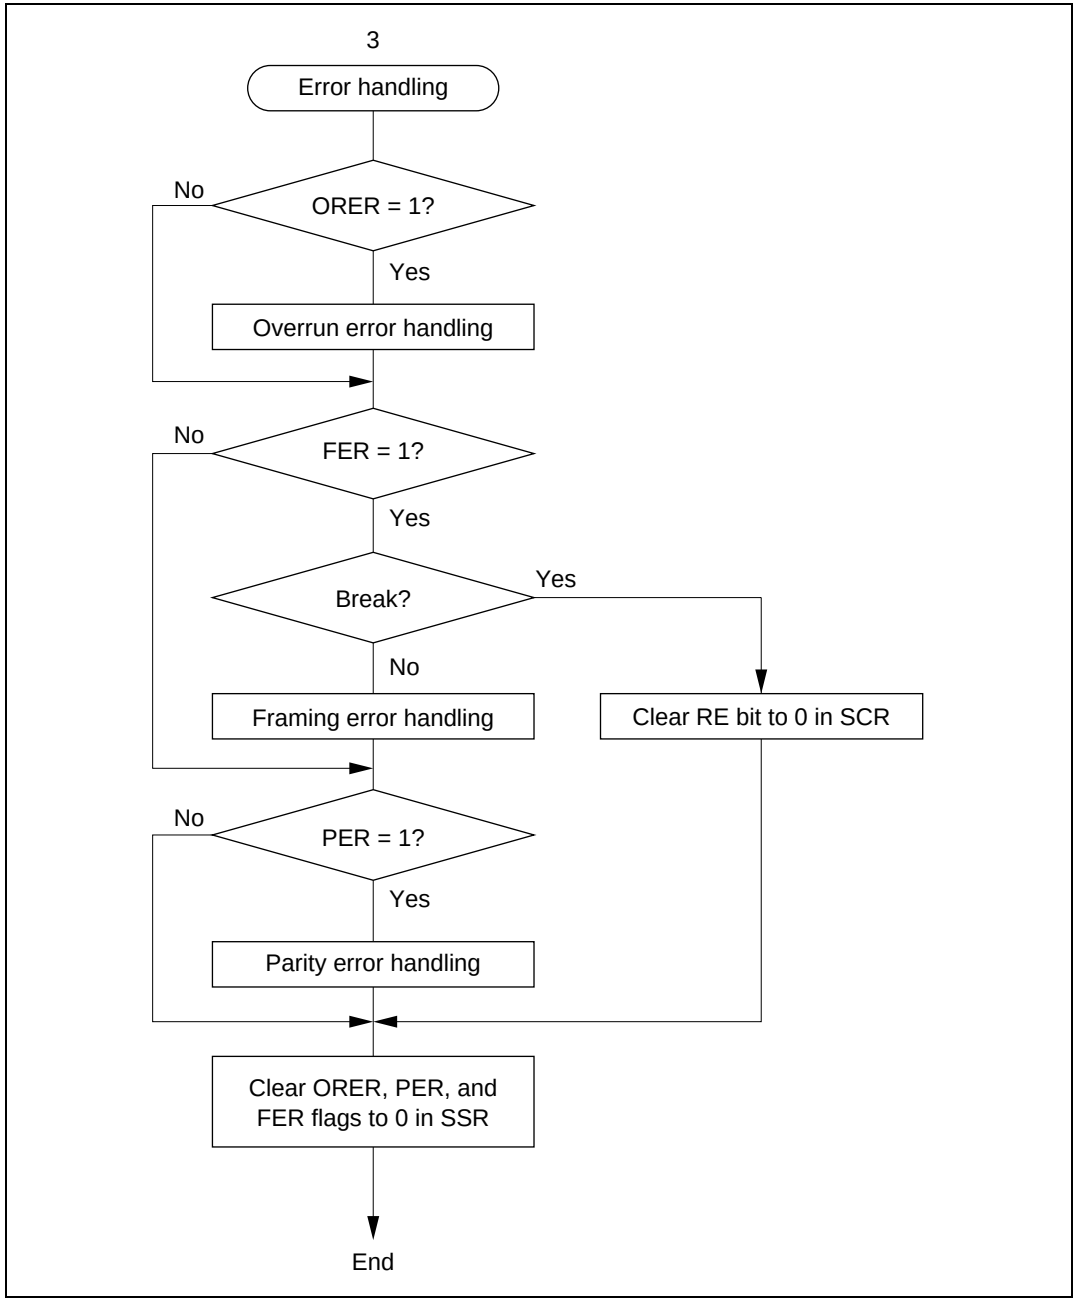


Figure 13.7 Sample Flowchart for Receiving Serial Data (2)

In receiving, the SCI operates as follows.

1. The SCI monitors the receive data line. When it detects a start bit, the SCI synchronizes internally and starts receiving.
2. Receive data is stored in RSR in order from LSB to MSB.
3. The parity bit and stop bit are received.
   After receiving, the SCI makes the following checks:
   a. Parity check: The number of 1s in the receive data must match the even or odd parity setting of the O/$\overline{E}$ bit in SMR.
   b. Stop bit check: The stop bit value must be 1. If there are two stop bits, only the first stop bit is checked.
   c. Status check: The RDRF flag must be 0 so that receive data can be transferred from RSR into RDR.

   If these checks all pass, the RDRF flag is set to 1 and the received data is stored in RDR. If one of the checks fails (receive error), the SCI operates as indicated in table 13.11.

Note: When a receive error occurs, further receiving is disabled. In receiving, the RDRF flag is not set to 1. Be sure to clear the error flags to 0.

4. When the RDRF flag is set to 1, if the RIE bit is set to 1 in SCR, a receive-data-full interrupt (RXI) is requested. If the ORER, PER, or FER flag is set to 1 and the RIE bit in SCR is also set to 1, a receive-error interrupt (ERI) is requested.

Table 13.11 Receive Error Conditions

Receive Error	Abbreviation	Condition	Data Transfer
Overrun error	ORER	Receiving of next data ends while RDRF flag is still set to 1 in SSR	Receive data not transferred from RSR to RDR
Framing error	FER	Stop bit is 0	Receive data transferred from RSR to RDR
Parity error	PER	Parity of receive data differs from even/odd parity setting in SMR	Receive data transferred from RSR to RDR

Figure 13.8 shows an example of SCI receive operation in asynchronous mode.

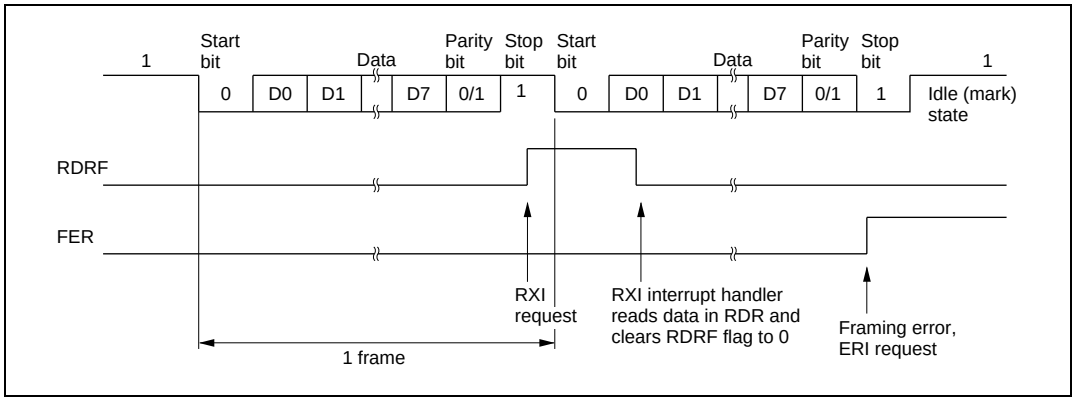

Figure 13.8 Example of SCI Receive Operation (8-Bit Data with Parity and One Stop Bit)

13.3.3 Multiprocessor Communication

The multiprocessor communication function enables several processors to share a single serial communication line. The processors communicate in asynchronous mode using a format with an additional multiprocessor bit (multiprocessor format).

In multiprocessor communication, each receiving processor is addressed by an ID. A serial communication cycle consists of an ID-sending cycle that identifies the receiving processor, and a data-sending cycle. The multiprocessor bit distinguishes ID-sending cycles from data-sending cycles.

The transmitting processor starts by sending the ID of the receiving processor with which it wants to communicate as data with the multiprocessor bit set to 1. Next the transmitting processor sends transmit data with the multiprocessor bit cleared to 0.

Receiving processors skip incoming data until they receive data with the multiprocessor bit set to 1. When they receive data with the multiprocessor bit set to 1, receiving processors compare the data with their IDs. The receiving processor with a matching ID continues to receive further incoming data. Processors with IDs not matching the received data skip further incoming data until they again receive data with the multiprocessor bit set to 1. Multiple processors can send and receive data in this way.

Figure 13.9 shows an example of communication among different processors using a multiprocessor format.

Communication Formats: Four formats are available. Parity-bit settings are ignored when a multiprocessor format is selected. For details see table 13.10.

Clock: See the description of asynchronous mode.

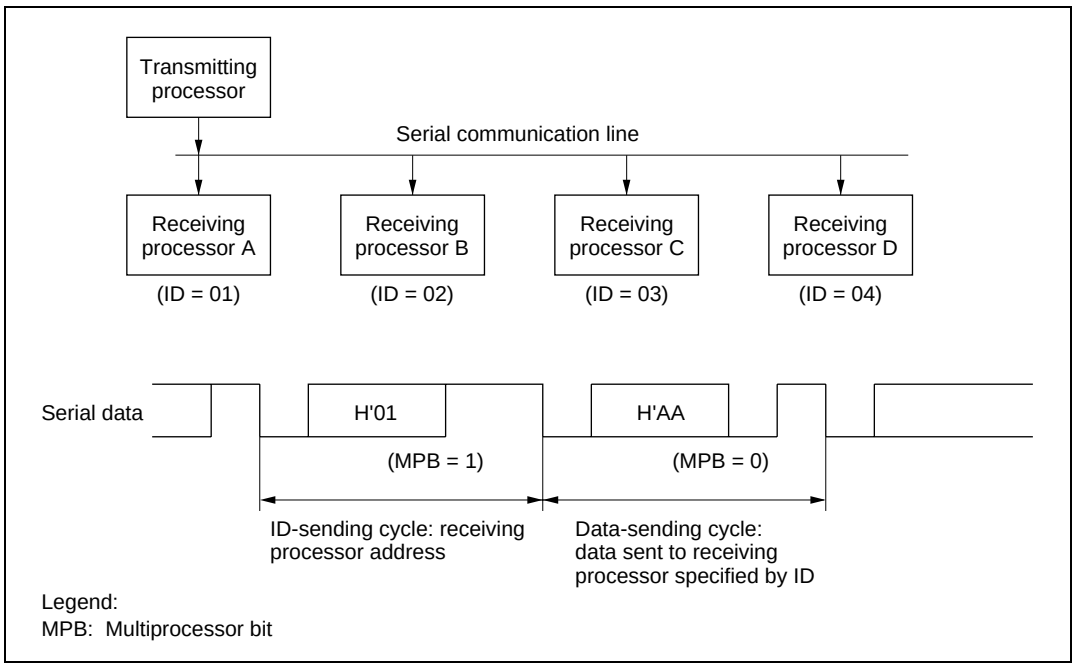

Figure 13.9 Example of Communication among Processors using Multiprocessor Format (Sending Data H'AA to Receiving Processor A)

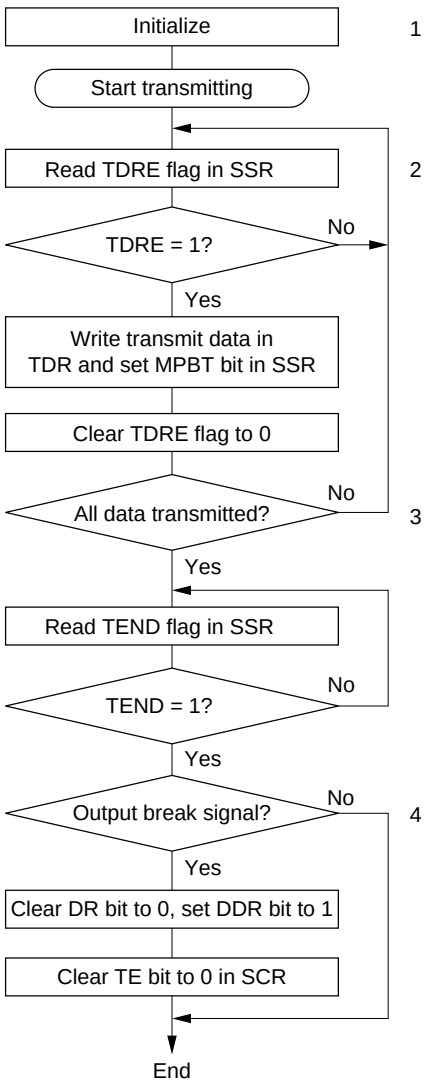
Transmitting and Receiving Data

- Transmitting Multiprocessor Serial Data

  Figure 13.10 shows a sample flowchart for transmitting multiprocessor serial data and indicates the procedure to follow.



1. SCI initialization: the transmit data output function of the TxD pin is selected automatically.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR. Also set the MPBT flag to 0 or 1 in SSR. Finally, clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0. When the DMAC is activated by a transmit-data-empty interrupt request (TXI) to write data in TDR, the TDRE flag is checked and cleared automatically.
4. To output a break signal at the end of serial transmission: set the DDR bit to 1 and clear the DR bit to 0 (DDR and DR are I/O port registers), then clear the TE bit to 0 in SCR.

Figure 13.10 Sample Flowchart for Transmitting Multiprocessor Serial Data

In transmitting serial data, the SCI operates as follows.

1. The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
2. After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit in SCR is set to 1, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

   Serial transmit data is transmitted in the following order from the TxD pin:

   a. Start bit: One 0 bit is output.
   b. Transmit data: 7 or 8 bits are output, LSB first.
   c. Multiprocessor bit: One multiprocessor bit (MPBT value) is output.
   d. Stop bit: One or two 1 bits (stop bits) are output.
   e. Mark state: Output of 1 bits continues until the start bit of the next transmit data.
3. The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag in SSR to 1, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 13.11 shows an example of SCI transmit operation using a multiprocessor format.

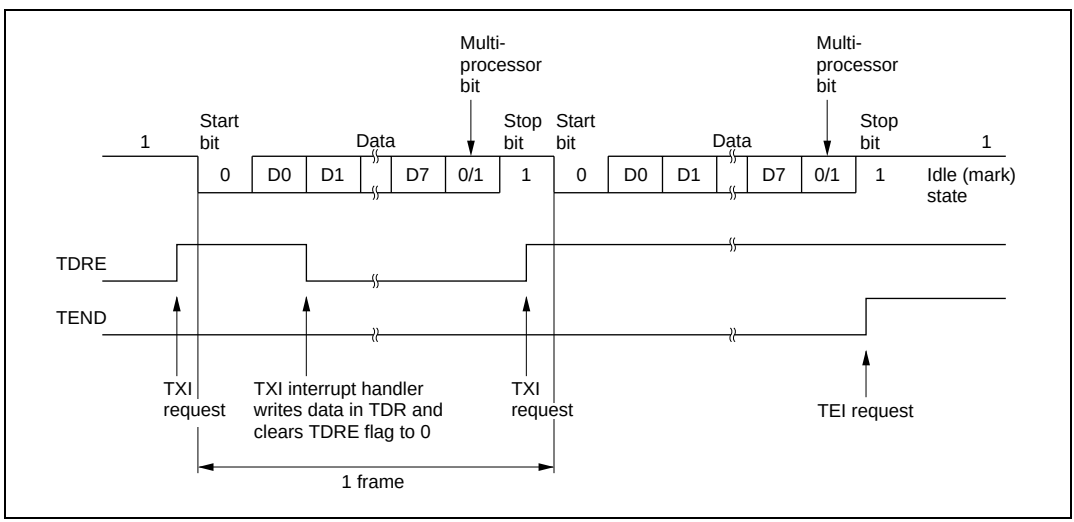


Figure 13.11 Example of SCI Transmit Operation (8-Bit Data with Multiprocessor Bit and One Stop Bit)

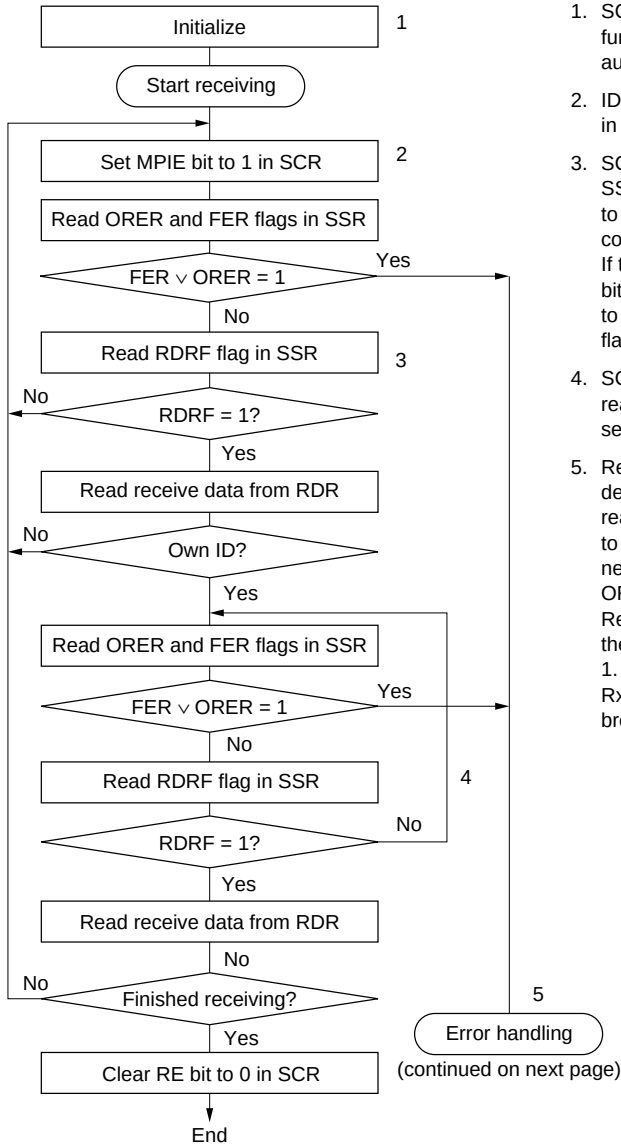
- Receiving Multiprocessor Serial Data

  Figure 13.12 shows a sample flowchart for receiving multiprocessor serial data and indicates the procedure to follow.



1. SCI initialization: the receive data function of the RxD pin is selected automatically.
2. ID receive cycle: set the MPIE bit to 1 in SCR.
3. SCI status check and ID check: read SSR, check that the RDRF flag is set to 1, then read data from RDR and compare with the processor's own ID. If the ID does not match, set the MPIE bit to 1 again and clear the RDRF flag to 0. If the ID matches, clear the RDRF flag to 0.
4. SCI status check and data receiving: read SSR, check that the RDRF flag is set to 1, then read data from RDR.
5. Receive error handling and break detection: if a receive error occurs, read the ORER and FER flags in SSR to identify the error. After executing the necessary error handling, clear the ORER and FER flags both to 0. Receiving cannot resume while either the ORER or FER flag remains set to 1. When a framing error occurs, the RxD pin can be read to detect the break state.

Figure 13.12 Sample Flowchart for Receiving Multiprocessor Serial Data (1)

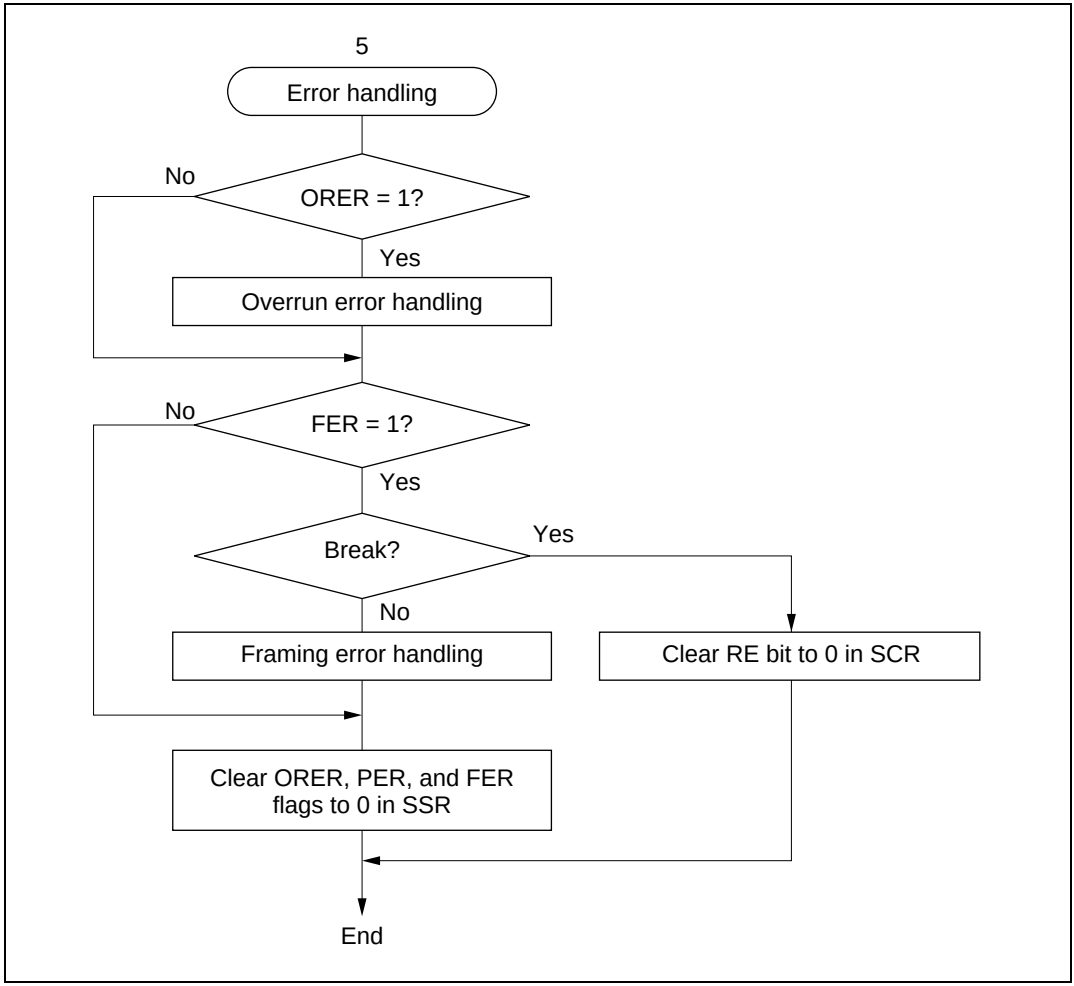


Figure 13.12 Sample Flowchart for Receiving Multiprocessor Serial Data (2)

Figure 13.13 shows an example of SCI receive operation using a multiprocessor format.

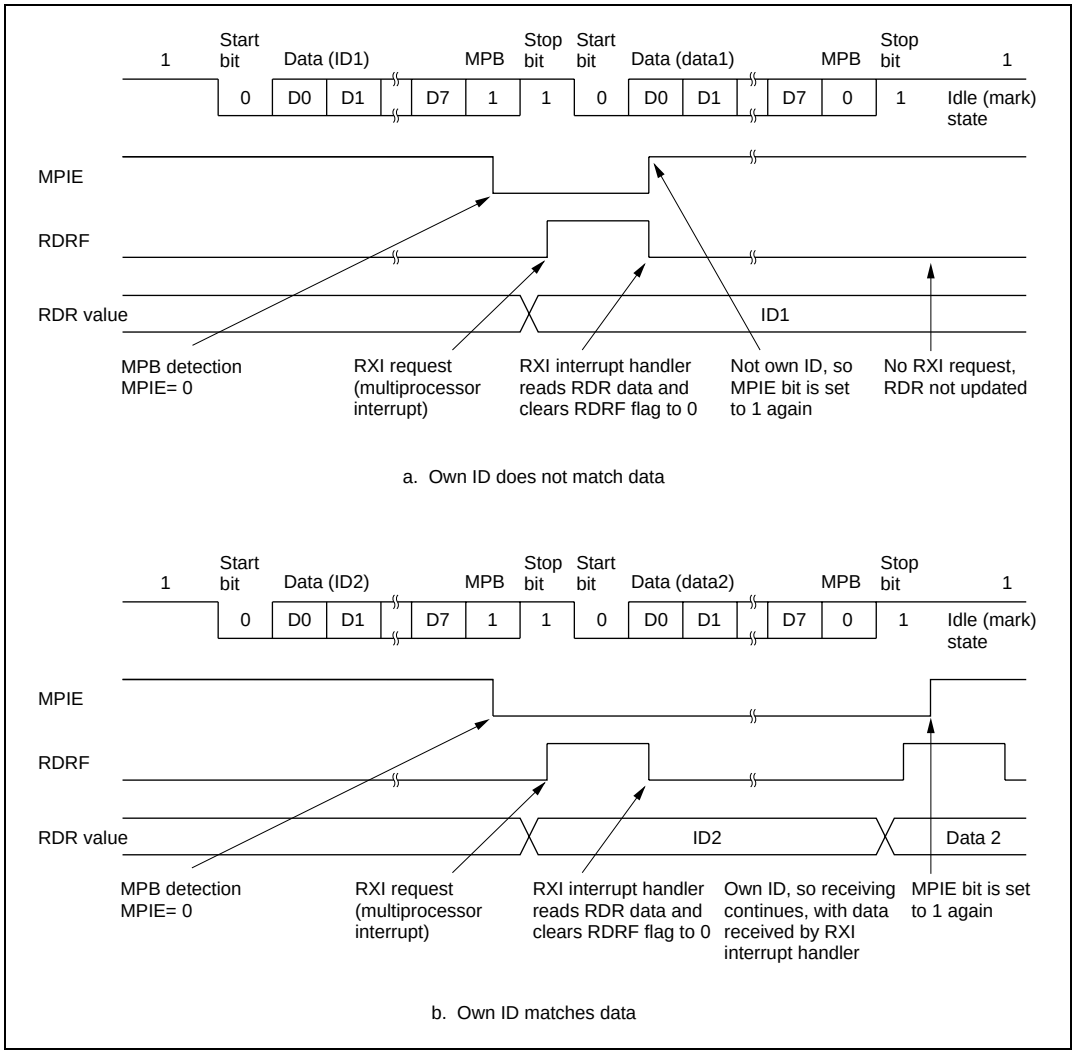

Figure 13.13 Example of SCI Receive Operation (8-Bit Data with Multiprocessor Bit and One Stop Bit)

13.3.4 Synchronous Operation

In synchronous mode, the SCI transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

The SCI transmitter and receiver share the same clock but are otherwise independent, so full duplex communication is possible. The transmitter and receiver are also double buffered, so continuous transmitting or receiving is possible by reading or writing data while transmitting or receiving is in progress.

Figure 13.14 shows the general format in synchronous serial communication.

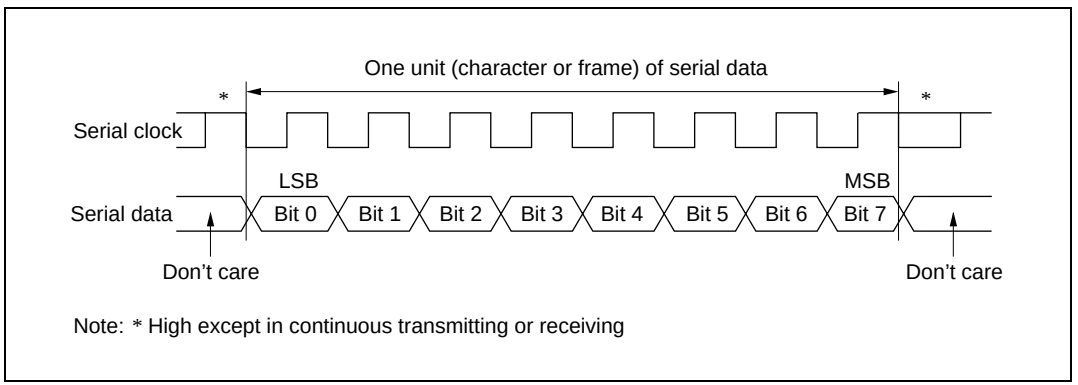

Figure 13.14 Data Format in Synchronous Communication

In synchronous serial communication, each data bit is placed on the communication line from one falling edge of the serial clock to the next. Data is guaranteed valid at the rise of the serial clock. In each character, the serial data bits are transmitted in order from LSB (first) to MSB (last). After output of the MSB, the communication line remains in the state of the MSB. In synchronous mode the SCI receives data by synchronizing with the rise of the serial clock.

Communication Format: The data length is fixed at 8 bits. No parity bit or multiprocessor bit can be added.

Clock: An internal clock generated by the on-chip baud rate generator or an external serial clock input from the SCK pin can be selected by means of the C/$\overline{A}$ bit in SMR and bits CKE1 and CKE0 in SCR. See table 13.9 for details of SCI clock source selection.

When the SCI operates on an internal clock, the serial clock is output from the SCK pin.

Eight serial clock pulses are output per transmitted or received character. When the SCI is not transmitting or receiving, the clock signal remains in the high state. However, in a receive-only

operation, the serial clock is output until an overrun error occurs or the RE bit is cleared to 0. For character-by-character reception, an external clock should be selected as the clock source.

Transmitting and Receiving Data

- SCI Initialization (Synchronous Mode)

  Before transmitting or receiving, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

  When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing the TE bit to 0 sets the TDRE flag to 1 and initializes TSR. Clearing the RE bit to 0, however, does not initialize the RDRF, PER, FER, and ORE flags and RDR, which retain their previous contents.

  Figure 13.15 is a sample flowchart for initializing the SCI.

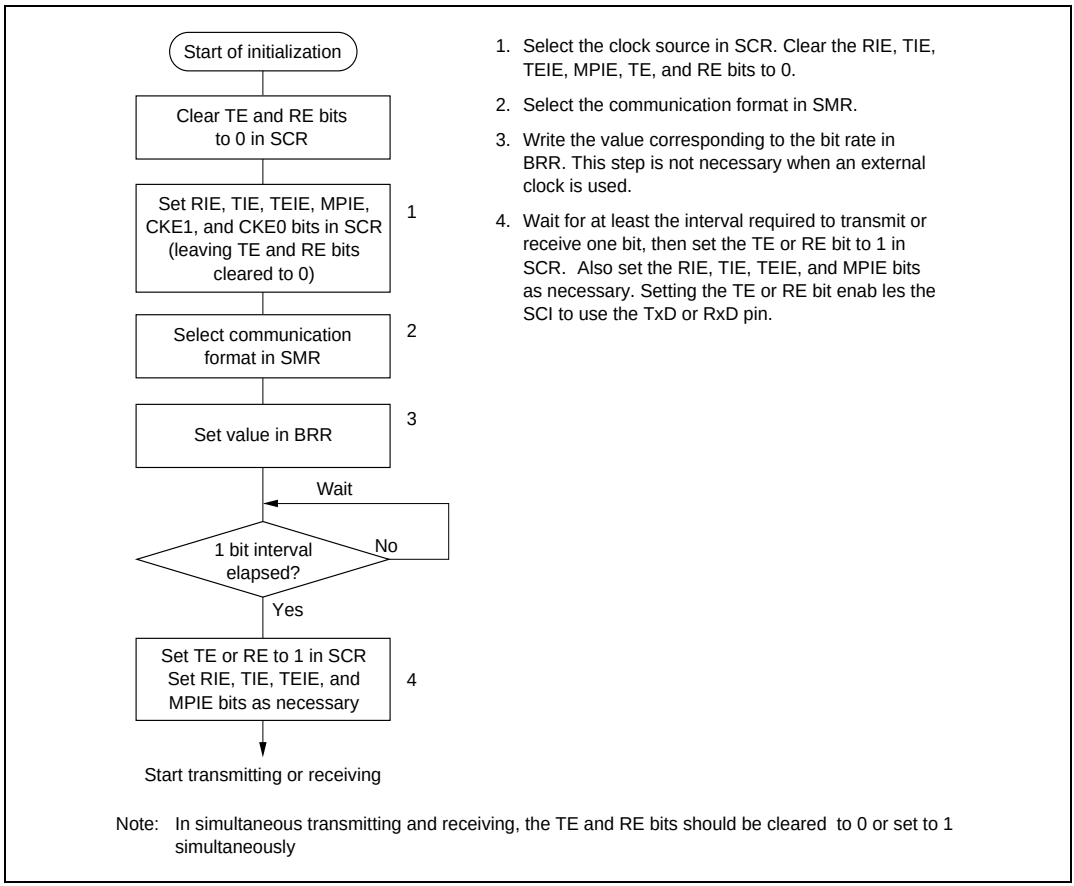

Figure 13.15 Sample Flowchart for SCI Initialization

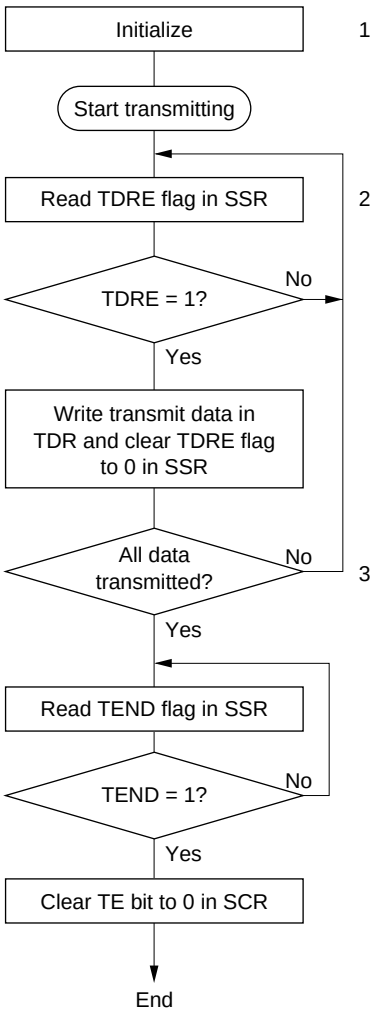
- Transmitting Serial Data (Synchronous Mode)

  Figure 13.16 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.



1. SCI initialization: the transmit data output function of the TxD pin is selected automatically.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0. When the DMAC is activated by a transmit-data-empty interrupt request (TXI) to write data in TDR, the TDRE flag is checked and cleared automatically.

Figure 13.16 Sample Flowchart for Serial Transmitting

In transmitting serial data, the SCI operates as follows.

1. The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.
2. After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

   If clock output is selected, the SCI outputs eight serial clock pulses. If an external clock source is selected, the SCI outputs data in synchronization with the input clock. Data is output from the TxD pin in order from LSB (bit 0) to MSB (bit 7).
3. The SCI checks the TDRE flag when it outputs the MSB (bit 7). If the TDRE flag is 0, the SCI loads data from TDR into TSR and begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, and after transmitting the MSB, holds the TxD pin in the MSB state. If the TEIE bit in SCR is set to 1, a transmit-end interrupt (TEI) is requested at this time.
4. After the end of serial transmission, the SCK pin is held in a constant state.

Figure 13.17 shows an example of SCI transmit operation.

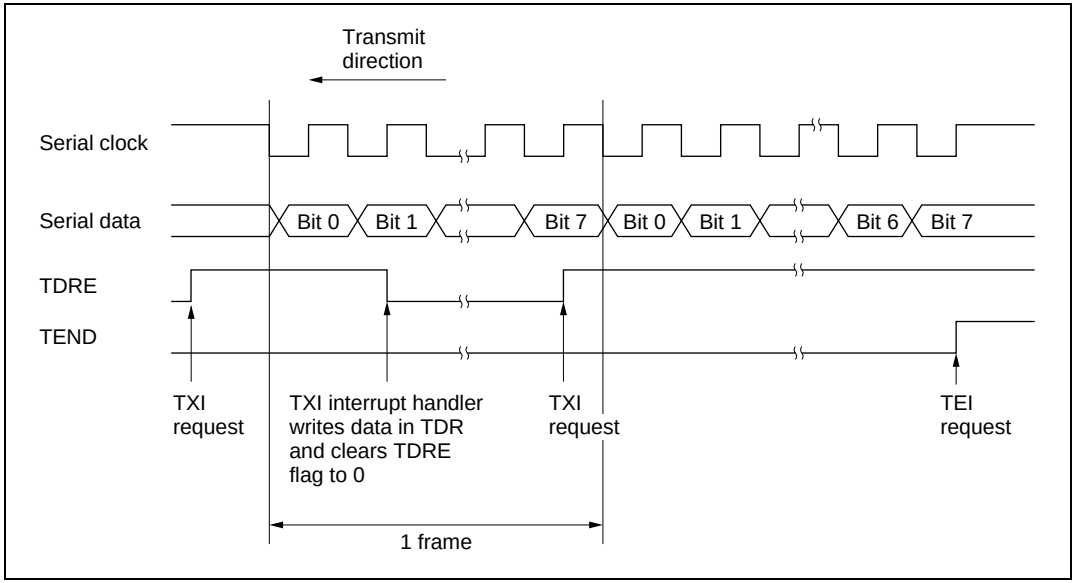


Figure 13.17 Example of SCI Transmit Operation

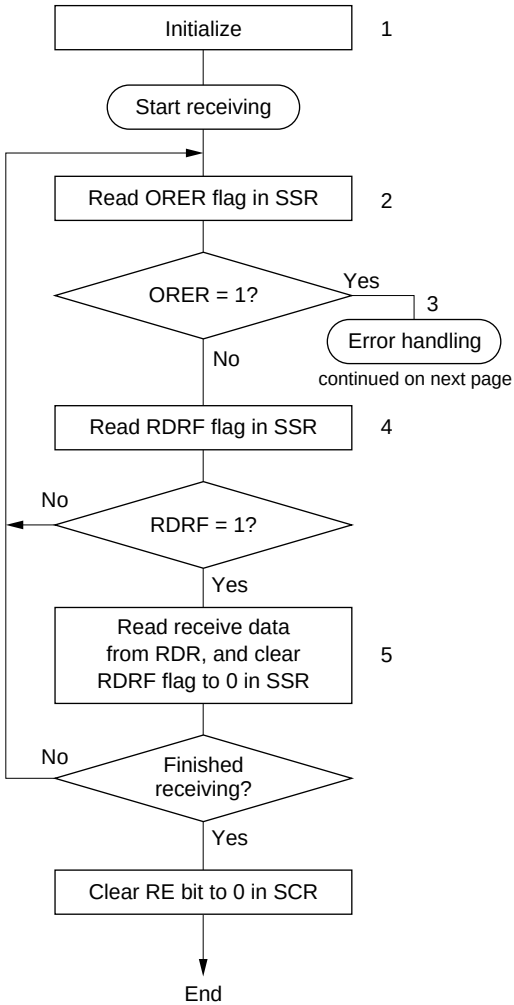
- Receiving Serial Data

  Figure 13.18 shows a sample flowchart for receiving serial data and indicates the procedure to follow. When switching from asynchronous mode to synchronous mode, make sure that the ORER, PER, and FER flags are cleared to 0. If the FER or PER flag is set to 1 the RDRF flag will not be set and both transmitting and receiving will be disabled.



1. SCI initialization: the receive data function of the RxD pin is selected automatically.

2, 3. Receive error handling: if a receive error occurs, read the ORER flag in SSR, then after executing the necessary error handling, clear the ORER flag to 0. Neither transmitting nor receiving can resume while the ORER flag remains set to 1.

4. SCI status check and receive data read: read SSR, check that the RDRF flag is set to 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.

5. To continue receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the MSB (bit 7) of the current frame is received. If the DMAC is activated by a receive-data-full interrupt request (RXI) to read RDR, the RDRF flag is cleared automatically.

Figure 13.18 Sample Flowchart for Serial Receiving (1)

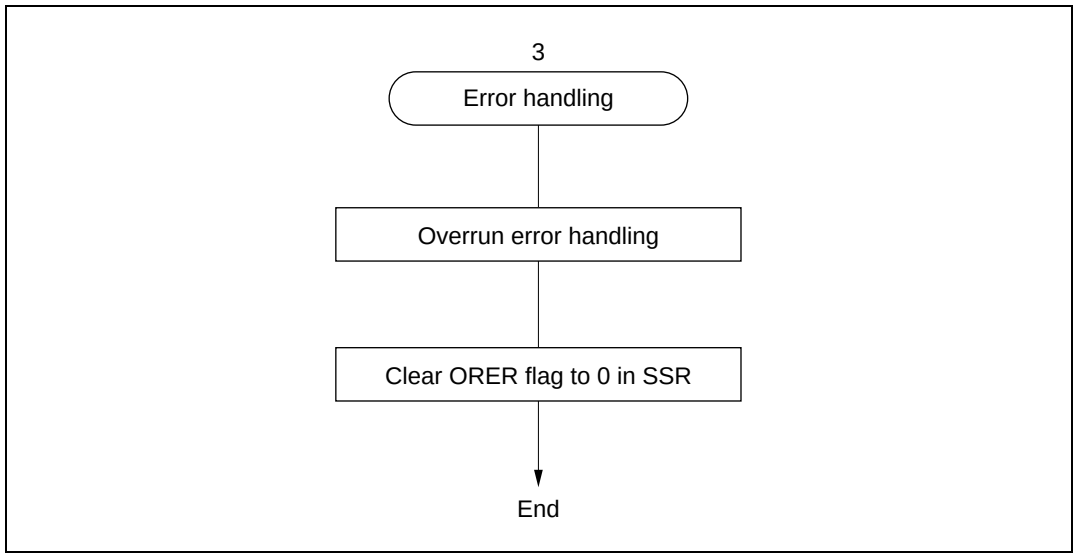


Figure 13.18 Sample Flowchart for Serial Receiving (2)

In receiving, the SCI operates as follows.

1. The SCI synchronizes with serial clock input or output and initializes internally.
2. Receive data is stored in RSR in order from LSB to MSB.

   After receiving the data, the SCI checks that the RDRF flag is 0 so that receive data can be transferred from RSR to RDR. If this check passes, the RDRF flag is set to 1 and the received data is stored in RDR. If the check does not pass (receive error), the SCI operates as indicated in table 13.11.

   When a receive error has been identified in the error check, subsequent transmit and receive operations are disabled.
3. After setting the RDRF flag to 1, if the RIE bit is set to 1 in SCR, the SCI requests a receive-data-full interrupt (RXI). If the ORER flag is set to 1 and the RIE bit in SCR is also set to 1, the SCI requests a receive-error interrupt (ERI).

Figure 13.19 shows an example of SCI receive operation.

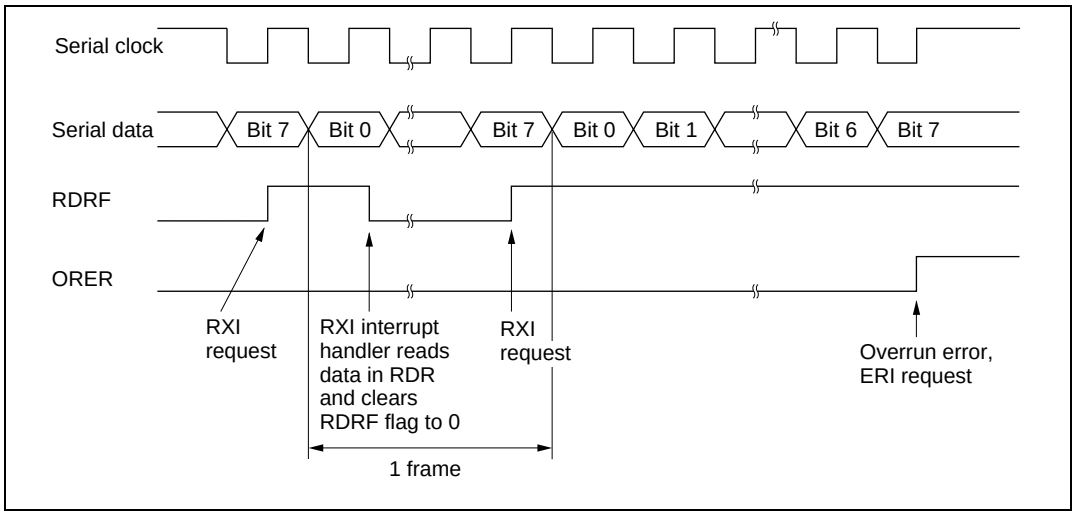

Figure 13.19 Example of SCI Receive Operation

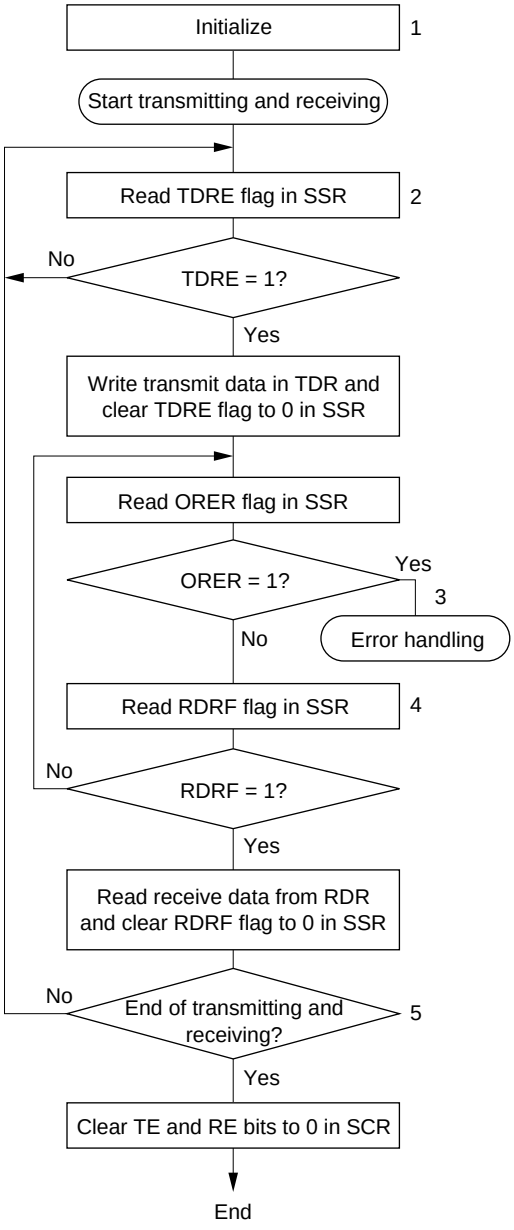
- Transmitting and Receiving Serial Data Simultaneously (Synchronous Mode)

  Figure 13.20 shows a sample flowchart for transmitting and receiving serial data simultaneously and indicates the procedure to follow.



1. SCI initialization: the transmit data output function of the TxD pin and receive data input function of the RxD pin are selected, enabling simultaneous transmitting and receiving.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0. Notification that the TDRE flag has changed from 0 to 1 can also be given by the TXI interrupt.
3. Receive error handling: if a receive error occurs, read the ORER flag in SSR, then after executing the necessary error handling, clear the ORER flag to 0. Neither transmitting nor receiving can resume while the ORER flag remains set to 1.
4. SCI status check and receive data read: read SSR, check that the RDRF flag is 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.
5. To continue transmitting and receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the MSB (bit 7) of the current frame is received. Also check that the TDRE flag is set to 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0 before the MSB (bit 7) of the current frame is transmitted. When the DMAC is activated by a transmit-data-empty interrupt request (TXI) to write data in TDR, the TDRE flag is checked and cleared automatically. When the DMA C is activated by a receive-data-full interrupt request (RXI) to read RDR, the RDRF flag is cleared automatically.

Note: When switching from transmitting or receiving to simultaneous transmitting and receiving, clear both the TE bit and the RE bit to 0, then set both bits to 1.

Figure 13.20 Sample Flowchart for Serial Transmitting

13.4 SCI Interrupts

The SCI has four interrupt request sources: TEI (transmit-end interrupt), ERI (receive-error interrupt), RXI (receive-data-full interrupt), and TXI (transmit-data-empty interrupt). Table 13.12 lists the interrupt sources and indicates their priority. These interrupts can be enabled and disabled by the TIE, TEIE, and RIE bits in SCR. Each interrupt request is sent separately to the interrupt controller.

The TXI interrupt is requested when the TDRE flag is set to 1 in SSR. The TEI interrupt is requested when the TEND flag is set to 1 in SSR. The TXI interrupt request can activate the DMAC to transfer data. Data transfer by the DMAC automatically clears the TDRE flag to 0. The TEI interrupt request cannot activate the DMAC.

The RXI interrupt is requested when the RDRF flag is set to 1 in SSR. The ERI interrupt is requested when the ORER, PER, or FER flag is set to 1 in SSR. The RXI interrupt request can activate the DMAC to transfer data. Data transfer by the DMAC automatically clears the RDRF flag to 0. The ERI interrupt request cannot activate the DMAC.

The DMAC can be activated by interrupts from SCI channel 0.

Table 13.12 SCI Interrupt Sources

Interrupt	Description	Priority
ERI	Receive error (ORER, FER, or PER)	High
RXI	Receive data register full (RDRF)	↑
TXI	Transmit data register empty (TDRE)	↑
TEI	Transmit end (TEND)	Low

13.5 Usage Notes

Note the following points when using the SCI.

TDR Write and TDRE Flag: The TDRE flag in SSR is a status flag indicating the loading of transmit data from TDR into TSR. The SCI sets the TDRE flag to 1 when it transfers data from TDR to TSR.

Data can be written into TDR regardless of the state of the TDRE flag. If new data is written in TDR when the TDRE flag is 0, the old data stored in TDR will be lost because this data has not yet been transferred to TSR. Before writing transmit data in TDR, be sure to check that the TDRE flag is set to 1.

Simultaneous Multiple Receive Errors: Table 13.13 indicates the state of SSR status flags when multiple receive errors occur simultaneously. When an overrun error occurs the RSR contents are not transferred to RDR, so receive data is lost.

Table 13.13 SSR Status Flags and Transfer of Receive Data

RDRF	ORER	FER	PER	Receive Data Transfer RSR → RDR	Receive Errors
1	1	0	0	×	Overrun error
0	0	1	0	O	Framing error
0	0	0	1	O	Parity error
1	1	1	0	×	Overrun error + framing error
1	1	0	1	×	Overrun error + parity error
0	0	1	1	O	Framing error + parity error
1	1	1	1	×	Overrun error + framing error + parity error

Legend:
O: Receive data is transferred from RSR to RDR.
×: Receive data is not transferred from RSR to RDR.

Break Detection and Processing: Break signals can be detected by reading the RxD pin directly when a framing error (FER) is detected. In the break state the input from the RxD pin consists of all 0s, so the FER flag is set and the parity error flag (PER) may also be set. In the break state the SCI receiver continues to operate, so if the FER flag is cleared to 0 it will be set to 1 again.

Sending a Break Signal: When the TE bit is cleared to 0 the TxD pin becomes an I/O port, the level and direction (input or output) of which are determined by DR and DDR bits. This feature can be used to send a break signal.

After the serial transmitter is initialized, the DR value substitutes for the mark state until the TE bit is set to 1 (the TxD pin function is not selected until the TE bit is set to 1). The DDR and DR bits should therefore both be set to 1 beforehand.

To send a break signal during serial transmission, clear the DR bit to 0, then clear the TE bit to 0. When the TE bit is cleared to 0 the transmitter is initialized, regardless of its current state, so the TxD pin becomes an output port outputting the value 0.

Receive Error Flags and Transmitter Operation (Synchronous Mode Only): When a receive error flag (ORER, PER, or FER) is set to 1 the SCI will not start transmitting, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 when starting to transmit. Note that clearing the RE bit to 0 does not clear the receive error flags to 0.

Receive Data Sampling Timing in Asynchronous Mode and Receive Margin: In asynchronous mode the SCI operates on a base clock with 16 times the bit rate frequency. In receiving, the SCI synchronizes internally with the fall of the start bit, which it samples on the base clock. Receive data is latched at the rising edge of the eighth base clock pulse. See figure 13.21.

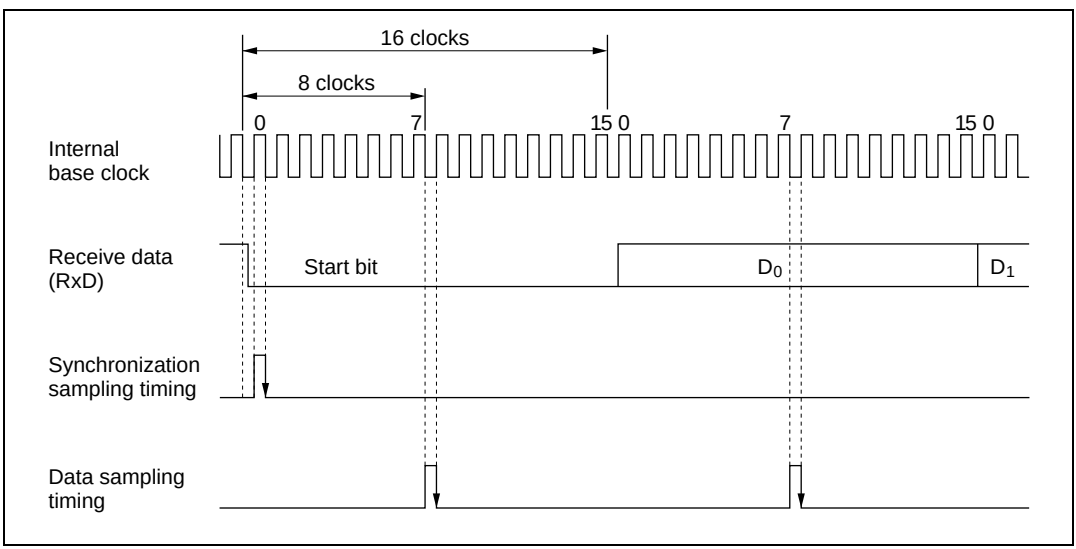


Figure 13.21 Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as in equation (1).

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\% \quad \text{..... (1)}$$

M: Receive margin (%)
N: Ratio of clock frequency to bit rate (N = 16)
D: Clock duty cycle (D = 0 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute deviation of clock frequency

From equation (1), if F = 0 and D = 0.5 the receive margin is 46.875%, as given by equation (2).

$$D = 0.5, F = 0$$
$$M = \{0.5 - 1/(2 \times 16)\} \times 100\%$$
$$= 46.875\% \quad \text{..... (2)}$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

Restrictions on Usage of DMAC: To have the DMAC read RDR, be sure to select the SCI receive-data-full interrupt (RXI) as the activation source with bits DTS2 to DTS0 in DTCR.

Restrictions on Usage of the Serial Clock: When transmitting data using the serial clock as an external clock, after clearing SSR of TDRE, maintain the space between each frame of the lead of the transmission clock (start-up edge) at five states or more (see Figure 13.22). This condition is also needed for continuous transmission. If it is not fulfilled, operational error will occur.

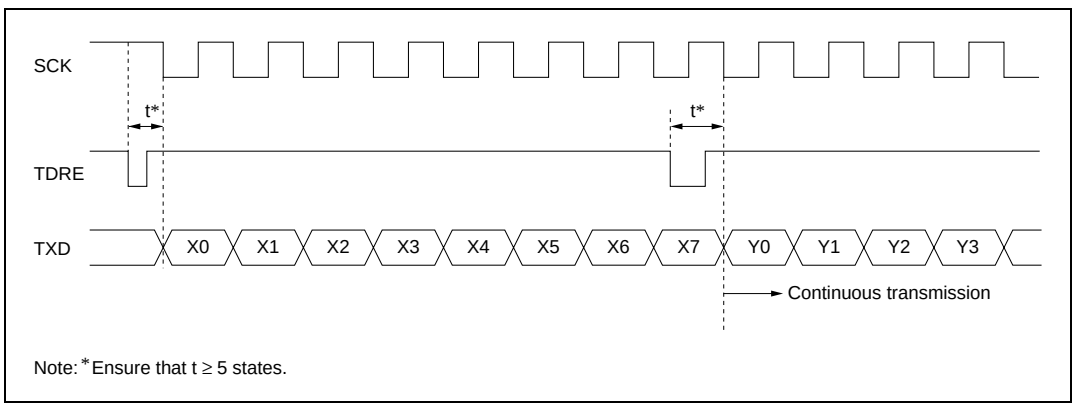

Figure 13.22 Serial Clock Transmission (Example)

Switching SCK Pin to Port Output Pin Function in Synchronous Mode: When the SCK pin is used as the serial clock output in synchronous mode, and is then switched to its output port function at the end of transmission, a low level may be output for one half-cycle. Half-cycle low-level output occurs when SCK is switched to its port function with the following settings when DDR = 1, DR = 1, C/$\overline{A}$ = 1, CKE1 = 0, CKE0 = 0, and TE = 1.

1. End of serial data transmission
2. TE bit = 0
3. C/$\overline{A}$ bit = 0 ... switchover to port outpu
4. Occurrence of low-level output (see figure 13.23)

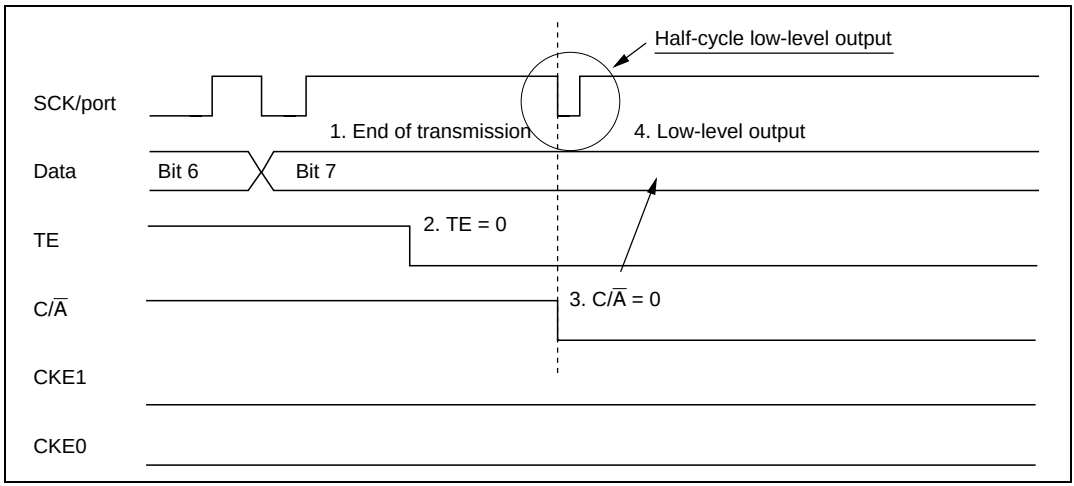

Figure 13.23 Operation when Switching from SCK Pin Function to Port Pin Function

Sample Procedure for Avoiding Low-Level Output

As this sample procedure temporarily places the SCK pin in the input state, the SCK/port pin should be pulled up beforehand with an external circuit.

With DDR = 1, DR = 1, C/$\overline{A}$ = 1, CKE1 = 0, CKE0 = 0, and TE = 1, make the following settings in the order shown.

1. End of serial data transmission
2. TE bit = 0
3. CKE1 bit = 1
4. C/$\overline{A}$ bit = 0 ... switchover to port output
5. CKE1 bit = 0

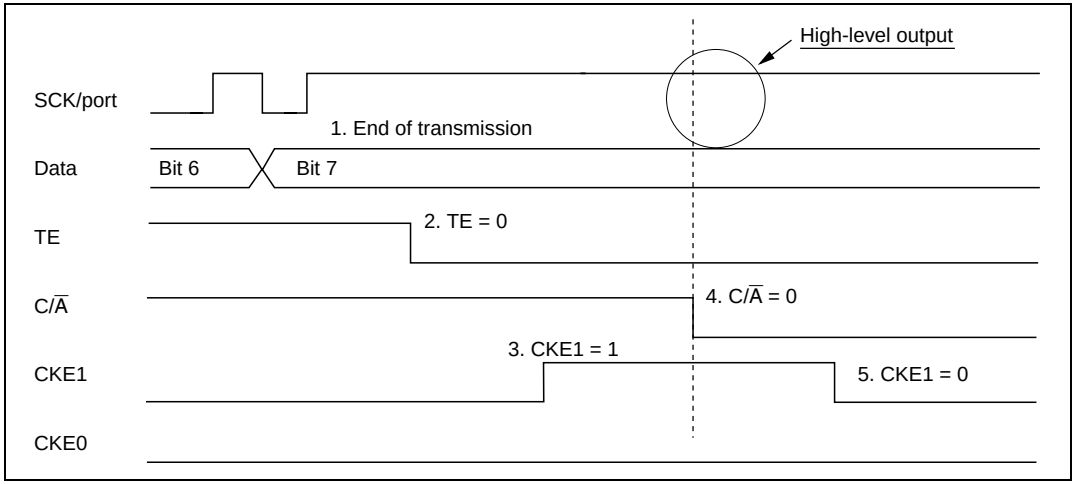

Figure 13.24 Operation when Switching from SCK Pin Function to Port Pin Function (Example of Preventing Low-Level Output)

Section 14 Smart Card Interface

14.1 Overview

As an extension of its serial communication interface functions, SCI0 supports a smart card (IC card) interface conforming to the ISO/IEC7816-3 (Identification Card) standard. Switchover between normal serial communication and the smart card interface is controlled by a register setting.

14.1.1 Features

Features of the smart-card interface supported by the H8/3052BF are listed below.

- Asynchronous communication
  - Data length: 8 bits
  - Parity bits generated and checked
  - Error signal output in receive mode (parity error)
  - Error signal detect and automatic data retransmit in transmit mode
  - Supports both direct convention and inverse convention
- Built-in baud rate generator with selectable bit rates
- Three types of interrupts

  Transmit-data-empty, receive-data-full, and receive-error interrupts are requested independently. The transmit-data-empty and receive-data-full interrupts can activate the DMA controller (DMAC) to transfer data.

14.1.2 Block Diagram

Figure 14.1 shows a block diagram of the smart card interface.

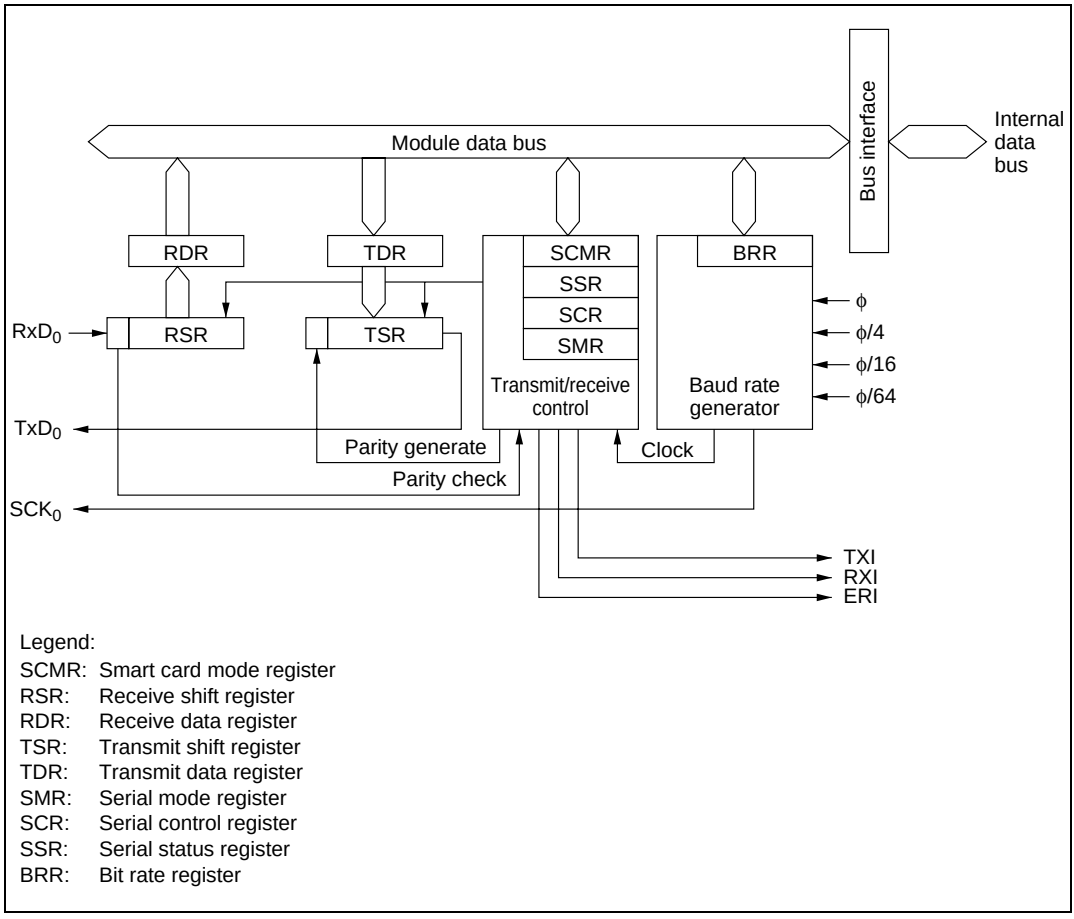

Figure 14.1 Smart Card Interface Block Diagram

14.1.3 Pin Configuration

Table 14.1 lists the smart card interface pins.

Table 14.1 Smart Card Interface Pins

Name	Abbreviation	I/O	Function
Serial clock pin	SCK_0	Output	Clock output
Receive data pin	RxD_0	Input	Receive data input
Transmit data pin	TxD_0	Output	Transmit data output

14.1.4 Register Configuration

The smart card interface has the internal registers listed in table 14.2. BRR, TDR, and RDR have their normal serial communication interface functions, as described in section 13, Serial Communication Interface.

Table 14.2 Registers

Address*1	Name	Abbreviation	R/W	Initial Value
H'FFB0	Serial mode register	SMR	R/W	H'00
H'FFB1	Bit rate register	BRR	R/W	H'FF
H'FFB2	Serial control register	SCR	R/W	H'00
H'FFB3	Transmit data register	TDR	R/W	H'FF
H'FFB4	Serial status register	SSR	R/(W)*2	F'84
H'FFB5	Receive data register	RDR	R	H'00
H'FFB6	Smart card mode register	SCMR	R/W	H'F2

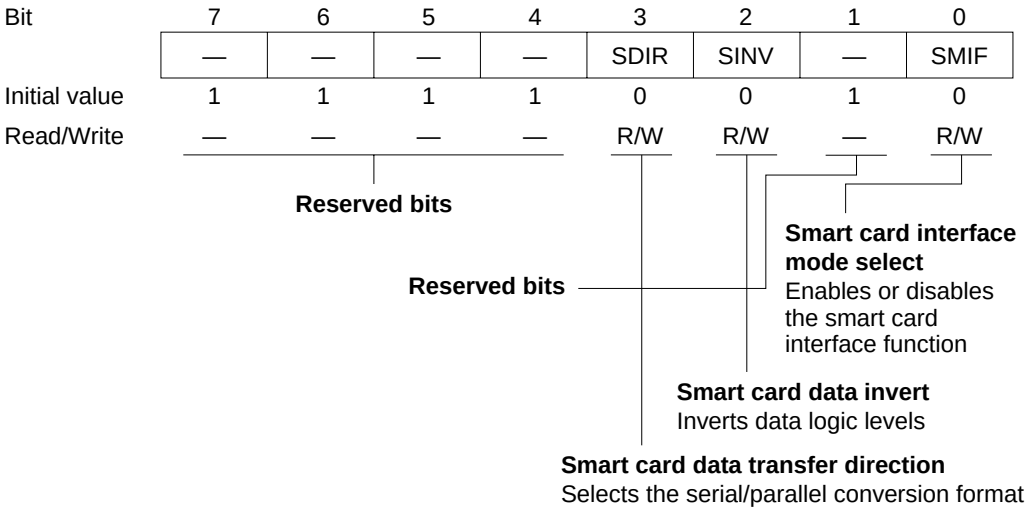
Notes: 1. Lower 16 bits of the address.
2. Only 0 can be written, to clear flags.

14.2 Register Descriptions

This section describes the new or modified registers and bit functions in the smart card interface.

14.2.1 Smart Card Mode Register (SCMR)

SCMR is an 8-bit readable/writable register that selects smart card interface functions.



SCMR is initialized to H'F2 by a reset and in standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—Smart Card Data Transfer Direction (SDIR): Selects the serial/parallel conversion format.

Bit 3: SDIR	Description	
0	TDR contents are transmitted LSB-first	(Initial value)
	Received data is stored LSB-first in RDR	
1	TDR contents are transmitted MSB-first	
	Received data is stored MSB-first in RDR	

Bit 2—Smart Card Data Inverter (SINV): Inverts data logic levels. This function is used in combination with bit 3 to communicate with inverse-convention cards. SINV does not affect the logic level of the parity bit. For parity settings, see section 14.3.4, Register Settings.

Bit 2: SINV	Description	
0	Unmodified TDR contents are transmitted	(Initial value)
	Received data is stored unmodified in RDR	
1	Inverted TDR contents are transmitted	
	Received data is inverted before storage in RDR	

Bit 1—Reserved: Read-only bit, always read as 1.

Bit 0—Smart Card Interface Mode Select (SMIF): Enables the smart card interface function.

Bit 0: SMIF	Description	
0	Smart card interface function is disabled	(Initial value)
1	Smart card interface function is enabled	

14.2.2 Serial Status Register (SSR)

The function of SSR bit 4 is modified in the smart card interface. This change also causes a modification to the setting conditions for bit 2 (TEND).

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Transmit end
Status flag indicating end of transmission

Error signal status (ERS)
Status flag indicating that an error signal has been received

Note: * Only 0 can be written, to clear the flag.

Bits 7 to 5: These bits operate as in normal serial communication. For details see section 13, Serial Communication Interface.

Bit 4—Error Signal Status (ERS): In smart card interface mode, this flag indicates the status of the error signal sent from the receiving device to the transmitting device. The smart card interface does not detect framing errors.

Bit 4: ERS	Description
0	Indicates normal data transmission, with no error signal returned (Initial value) [Clearing conditions] • The chip is reset or enters standby mode. • Software reads ERS while it is set to 1, then writes 0.
1	Indicates that the receiving device sent an error signal reporting a parity error [Setting condition] A low error signal was sampled.

Note: Clearing the TE bit to 0 in SCR does not affect the ERS flag, which retains its previous value.

Bits 3 to 0: These bits operate as in normal serial communication. For details see section 13, Serial Communication Interface. The setting conditions for transmit end (TEND, bit 2), however, are modified as follows.

Bit 2: TEND	Description
0	Transmission is in progress [Clearing conditions] • Software reads TDRE while it is set to 1, then writes 0 in the TDRE flag. • The DMAC writes data in TDR.
1	End of transmission (Initial value) [Setting conditions] • The chip is reset or enters standby mode. • The TE bit and FER/ERS bit are both cleared to 0 in SCR. • TDRE is 1 and FER/ERS is 0 at a time 2.5 etu after the last bit of a 1-byte serial character is transmitted (normal transmission)

Note: An etu (elementary time unit) is the time needed to transmit one bit.

14.2.3 Serial Mode Register (SMR)

Bit 7 of SMR has a different function in smart card interface mode. The related serial control register (SCR) changes from bit 1 to bit 0.

Bit	7	6	5	4	3	2	1	0
	GM	CHR	PR	O/$\overline{E}$	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 7—GSM Mode (GM): Set at 0 when using the regular smart card interface. In GSM mode, set to 1. When transmission is complete, initially the TEND flag set timing appears followed by clock output restriction mode. Clock output restriction mode comprises serial control register bit 1 and bit 0.

Bit 7: GM	Description
0	Using the regular smart card interface mode
	The TEND flag is set 12.5 etu after the beginning of the start bit (Initial value)
	Clock output on/off control only
1	Using the GSM mode smart card interface mode
	The TEND flag is set 11.0 etu after the beginning of the start bit
	Clock output on/off and fixed-high/fixed-low control (set in SCR)

Bits 6 to 0: Operate in the same way as for the normal SCI.

For details, see section 13.2.5, Serial Mode Register (SMR).

14.2.4 Serial Control Register (SCR)

Bits 1 and 0 have different functions in smart card interface mode.

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 7 to 2: Operate in the same way as for the normal SCI.

For details, see section 13.2.6, Serial Control Register (SCR).

Bits 1 and 0—Clock Enable (CKE1, CKE0): Setting enable or disable for the SCI clock selection and clock output from the SCK pin. In smart card interface mode, it is possible to switch between enabling and disabling of the normal clock output, and specify a fixed high level or fixed low level for the clock output.

SMR	**SCR**		
Bit 7: GM	**Bit 1: CKE1**	**Bit 0: CKE0**	**Description**
0	0	0	The internal clock/SCK0 pin functions as an I/O port (Initial value)
0	0	1	The internal clock/SCK0 pin functions as the clock output
1	0	0	The internal clock/SCK0 pin is fixed at low-level output
1	0	1	The internal clock/SCK0 pin functions as the clock output
1	1	0	The internal clock/SCK0 pin is fixed at high-level output
1	1	1	The internal clock/SCK0 pin functions as the clock output

14.3 Operation

14.3.1 Overview

The main features of the smart-card interface are as follows.

- One frame consists of eight data bits and a parity bit.
- In transmitting, a guard time of at least two elementary time units (2 etu) is provided between the end of the parity bit and the start of the next frame. (An elementary time unit is the time required to transmit one bit.)
- In receiving, if a parity error is detected, a low error signal is output for 1 etu, beginning 10.5 etu after the start bit.
- In transmitting, if an error signal is received, after at least 2 etu, the same data is automatically transmitted again.
- Only asynchronous communication is supported. There is no synchronous communication function.

14.3.2 Pin Connections

Figure 14.2 shows a pin connection diagram for the smart card interface.

In communication with a smart card, data is transmitted and received over the same signal line. The TxD_0 and RxD_0 pins should both be connected to this line. The data transmission line should be pulled up to V_{CC} through a resistor.

If the smart card uses the clock generated by the smart card interface, connect the SCK_0 output pin to the card's CLK input. If the card uses its own internal clock, this connection is unnecessary.

The reset signal should be output from one of the H8/3052BF' generic ports.

In addition to these pin connections, power and ground connections will normally also be necessary.

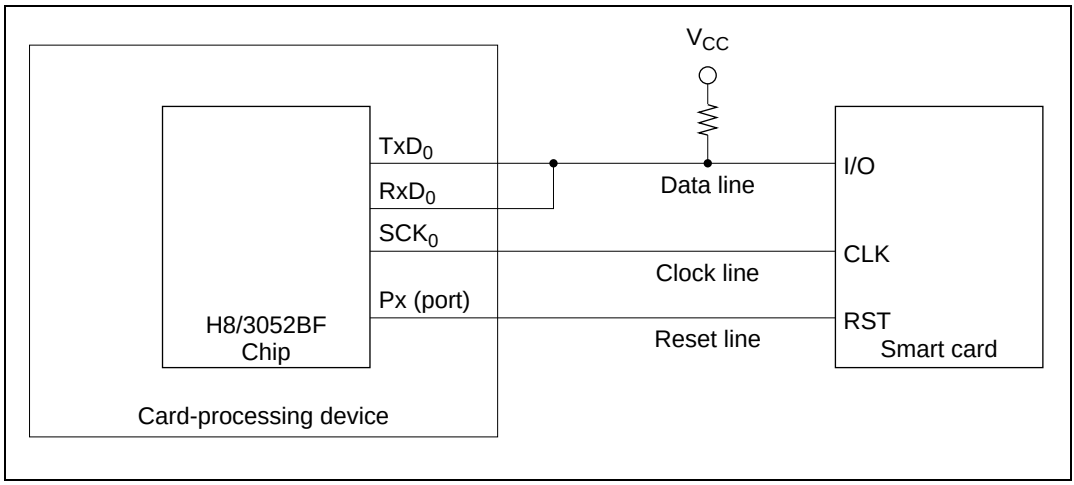


Figure 14.2 Smart Card Interface Connection Diagram

Note: A loop-back test can be performed by setting both RE and TE to 1 without connecting a smart card.

14.3.3 Data Format

Figure 14.3 shows the data format of the smart card interface. In receive mode, parity is checked once per frame. If a parity error is detected, an error signal is returned to the transmitting device to request retransmission. In transmit mode, the error signal is sampled and the same data is retransmitted if the error signal is low.

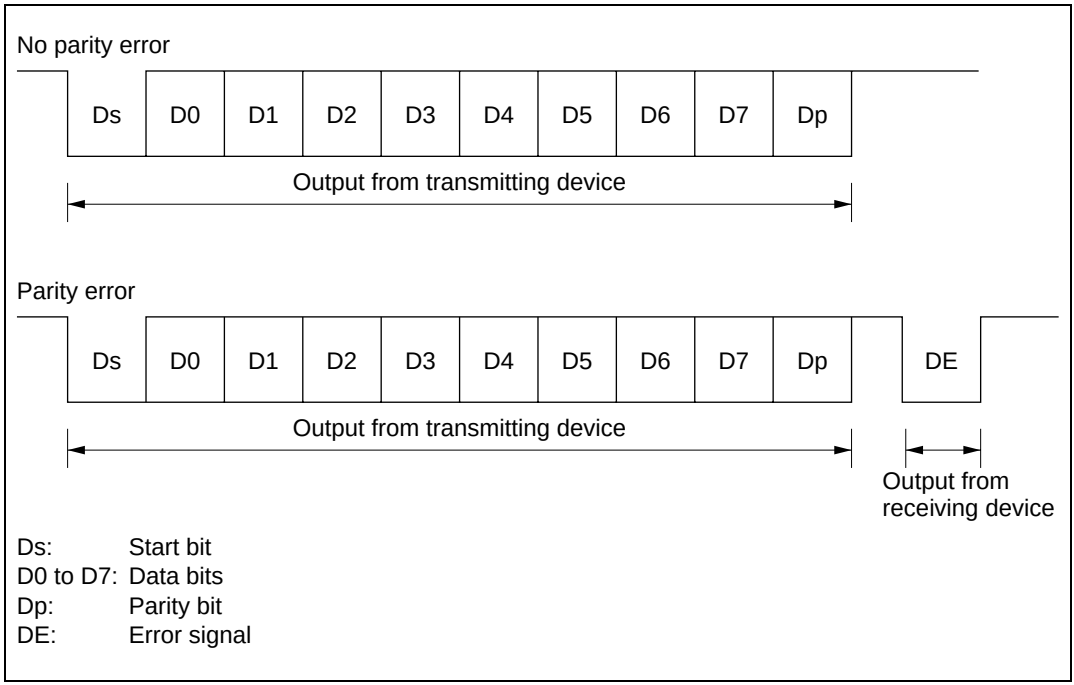

Figure 14.3 Smart Card Interface Data Format

The operating sequence is as follows.

1. When not in use, the data line is in the high-impedance state, and is pulled up to the high level through a resistor.
2. To start transmitting a frame of data, the transmitting device transmits a low start bit (Ds), followed by eight data bits (D0 to D7) and a parity bit (Dp).
3. Next, in the smart card interface, the transmitting device returns the data line to the high-impedance state. The data line is pulled up to the high level through a resistor.
4. The receiving device performs a parity check. If there is no parity error, the receiving device waits to receive the next data. If a parity error is present, the receiving device outputs a low error signal (DE) to request retransmission of the data. After outputting the error signal for a

designated interval, the receiving device returns the signal line to the high-impedance state. The signal line is pulled back up to the high level through the pull-up resistor.

5. If the transmitting device does not receive an error signal, it proceeds to transmit the next data. If it receives an error signal, it returns to step 2 and transmits the same data again.

14.3.4 Register Settings

Table 14.3 shows a bit map of the registers used in the smart card interface. Bits indicated as 0 or 1 should always be set to the indicated value. The settings of the other bits will be described in this section.

Table 14.3 Register Settings in Smart Card Interface

Register	Address*1	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SMR	H'FFB0	GM	0	1	O/$\overline{E}$	1	0	CKS1	CKS0
BRR	H'FFB1	BRR7	BRR6	BRR5	BRR4	BRR3	BRR2	BRR1	BRR0
SCR	H'FFB2	TIE	RIE	TE	RE	0	0	CKE1*2	CKE0
TDR	H'FFB3	TDR7	TDR6	TDR5	TDR4	TDR3	TDR2	TDR1	TDR0
SSR	H'FFB4	TDRE	RDRF	ORER	ERS	PER	TEND	0	0
RDR	H'FFB5	RDR7	RDR6	RDR5	RDR4	RDR3	RDR2	RDR1	RDR0
SCMR	H'FFB6	—	—	—	—	SDIR	SINV	—	SMIF

Legend: — Unused bit.

Notes: 1. Lower 16 bits of the address.
2. When the GM of the SMR is set at 0, be sure the CKE1 bit is 0.

Serial Mode Register (SMR) Settings: In regular smart card interface mode, set the GM bit at 0. In regular smart card mode, clear the GM bit to 0. In GSM mode, set the GM bit to 1. Clear the O/$\overline{E}$ bit to 0 if the smart card uses the direct convention. Set the O/$\overline{E}$ bit to 1 if the smart card uses the inverse convention. Bits CKS1 and CKS0 select the clock source of the built-in baud rate generator. See section 14.3.5, Clock.

Bit Rate Register (BRR) Settings: This register sets the bit rate. Equations for calculating the setting are given in section 14.3.5, Clock.

Serial Control Register (SCR): The TIE, RIE, TE, and RE bits have their normal serial communication functions. For details, see section 13, Serial Communication Interface. The CKE1 and CKE0 bits select clock output. When the GM bit of the SMR is cleared to 0, to disable clock output, clear this bit to 00. To enable clock output, set this bit to 01. When the GM bit of the SMR is set to 1, clock output is enabled. Clock output is fixed at high or low.

Smart Card Mode Register (SCMR): If the smart card follows the direct convention, clear the SDIR and SINV bits to 0. If the smart card follows the indirect convention, set the SDIR and SINV bits to 1. To use the smart card interface, set the SMIF bit to 1.

The register settings and examples of starting character waveforms are shown below for two smart cards, one following the direct convention and one the inverse convention.

- Direct convention (SDIR = SINV = O/$\overline{E}$ = 0)

  In the direct convention, state Z corresponds to logic level 1, and state A to logic level 0. Characters are transmitted and received LSB-first. In the example above the first character data is H'3B. The parity bit is 1, following the even parity rule designated for smart cards.

- Inverse convention (SDIR = SINV = O/$\overline{E}$ = 1)

  In the inverse convention, state A corresponds to the logic level 1, and state Z to the logic level 0. Characters are transmitted and received MSB-first. In the example above the first character data is H'3F. Following the even parity rule designated for smart cards, the parity bit logic level is 0, corresponding to state Z.

In the H8/3052BF, the SINV bit inverts only the data bits D7 to D0. The parity bit is not inverted, so the O/$\overline{E}$ bit in SMR must be set to odd parity mode. This applies in both transmitting and receiving.

14.3.5 Clock

As its serial communication clock, the smart card interface can use only the internal clock generated by the on-chip baud rate generator. The bit rate can be selected by setting the bit rate register (BRR) and bits CKS1 and CKS0 in the serial mode register (SMR). The bit rate can be calculated from the equation given below. Table 14.5 lists some examples of bit rate settings.

If bit CKE0 is set to 1, a clock signal with a frequency equal to 372 times the bit rate is output from the SCK_0 pin.

$$B = \frac{\phi}{1488 \times 2^{2n-1} \times (N + 1)} \times 10^6$$

where, N: BRR setting ($0 \leq N \leq 255$)
B: Bit rate (bits/s)
ϕ: System clock frequency (MHz)*
n: See table 14.4

Table 14.4 n-Values of CKS1 and CKS0 Settings

n	CKS1	CKS0
0	0	0
1	0	1
2	1	0
3	1	1

Note: * If the gear function is used to divide the system clock frequency, use the divided frequency to calculate the bit rate. The equation above applies directly to 1/1 frequency division.

Table 14.5 Bit Rates (bits/s) for Different BRR Settings (when n = 0)

	ϕ (MHz)								
N	**7.1424**	**10.00**	**10.7136**	**13.00**	**14.2848**	**16.00**	**18.00**	**20.00**	**25.00**
0	9600.0	13440.9	14400.0	17473.1	19200.0	21505.4	24193.5	26881.7	33602.2
1	4800.0	6720.4	7200.0	8736.6	9600.0	10752.7	12096.8	13440.9	16801.1
2	3200.0	4480.3	4800.0	5824.4	6400.0	7168.5	8064.5	8960.6	11200.7

Note: Bit rates are rounded off to one decimal place.

The following equation calculates the bit rate register (BRR) setting from the system clock frequency and bit rate. N is an integer from 0 to 255, specifying the value with the smaller error.

$$N = \frac{\phi}{1488 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Table 14.6 BRR Settings for Typical Bit Rate (bits/s) (when n = 0)

	ϕ (MHz)								
	7.1424	10.00	10.7136	13.00	14.2848	16.00	18.00	20.00	25.00
Bit/s	N Error	N Error	N Error	N Error	N Error	N Error	N Error	N Error	N Error
9600	0 0.00	1 30.00	1 25.00	1 8.99	1 0.00	1 12.01	2 15.99	2 6.66	3 12.49

Table 14.7 Maximum Bit Rates for Various Frequencies (Smart Card Interface)

ϕ (MHz)	Maximum Bit Rate (bits/s)	N	n
7.1424	9600	0	0
10	13441	0	0
10.7136	14400	0	0
13	17473	0	0
14.2848	19200	0	0
16	21505	0	0
18	24194	0	0
20	26882	0	0
25	33602	0	0

The bit rate error is calculated from the following equation.

$$\text{Error (\%)} = \left\{ \frac{\phi}{1488 \times 2^{2n-1} \times B \times (N+1)} \times 10^6 - 1 \right\} \times 100$$

14.3.6 Transmitting and Receiving Data

Initialization: Before transmitting or receiving data, initialize the smart card interface by the procedure below. Initialization is also necessary when switching from transmit mode to receive mode or from receive mode to transmit mode.

1. Clear the TE and RE bits to 0 in the serial control register (SCR).
2. Clear the ERS, PER, and ORER error flags to 0 in the serial status register (SSR).
3. Set the parity mode bit (O/$\overline{E}$) and baud rate generator clock source select bits (CKS1 and CKS0) as required in the serial mode register (SMR). At the same time, clear the C/$\overline{A}$, CHR, and MP bits to 0, and set the STOP and PE bits to 1.
4. Set the SMIF, SDIR, and SINV bits as required in the smart card mode register (SMR). When the SMIF bit is set to 1, the TxD_0 and RxD_0 pins switch from their I/O port functions to their serial communication interface functions, and are placed in the high-impedance state.
5. Set a value corresponding to the desired bit rate in the bit rate register (BRR).
6. Set clock enable bit 0 (CKE0) as required in the serial control register (SCR). Write 0 in the TIE, RIE, TE, RE, MPIE, TEIE, and CKE1 bits. If bit CKE0 is set to 1, a serial clock will be output from the SCK_0 pin.
7. Wait for at least the interval required to transmit or receive one bit, then set the TIE, RIE, TE, and RE bits as necessary in SCR. Do not set TE and RE both to 1, except when performing a loop-back test.

Transmitting Serial Data: The transmitting procedure in smart card mode is different from the normal SCI procedure, because of the need to sample the error signal and retransmit. Figure 14.4 shows a flowchart for transmitting, and figure 14.5 shows the relation between a transmit operation and the internal registers.

1. Initialize the smart card interface by the procedure given above in Initialization.
2. Check that the ERS error flag is cleared to 0 in SSR.
3. Check that the TEND flag is set to 1 in SSR. Repeat steps 2 and 3 until this check passes.
4. Write transmit data in TDR and clear the TDRE flag to 0. The data will be transmitted and the TEND flag will be cleared to 0.
5. To continue transmitting data, return to step 2.
6. To terminate transmission, clear the TE bit to 0.

This procedure may include interrupt handling and DMA transfer.

If the TIE bit is set to 1 to enable interrupt requests, when transmission is completed and the TEND flag is set to 1, a transmit-data-empty interrupt (TXI) is requested. If the RIE bit is set to 1

to enable interrupt requests, when a transmit error occurs and the ERS flag is set to 1, a transmit/receive-error interrupt (ERI) is requested.

The timing of TEND flag setting depends on the GM bit in SMR. The timing is shown in figure 14.6.

If the TXI interrupt activates the DMAC, the number of bytes designated in the DMAC can be transmitted automatically, including automatic retransmit.

For details, see Interrupt Operations and Data Transfer by DMAC in this section.

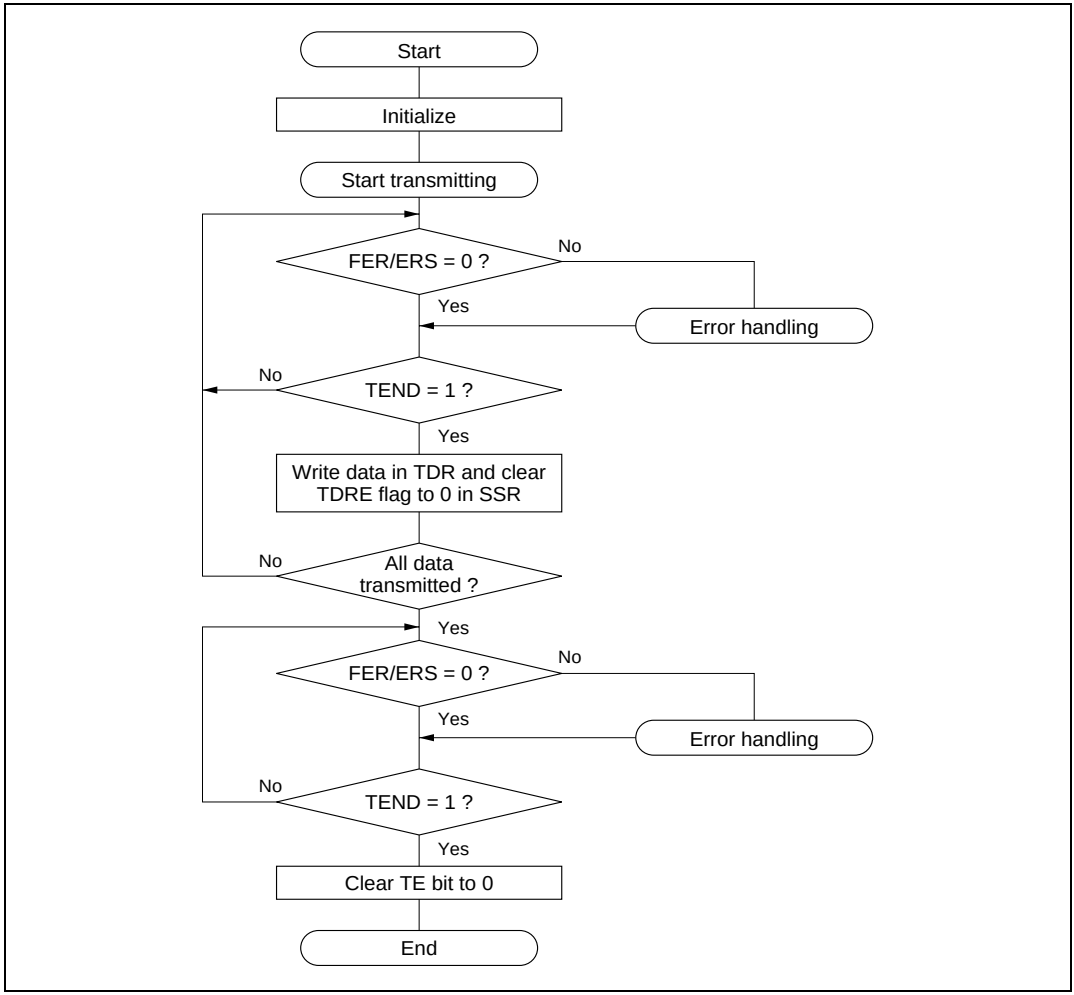

Figure 14.4 Transmit Flowchart (Example)

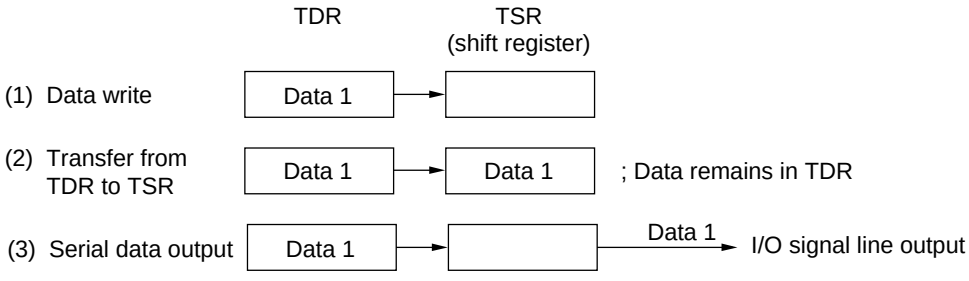

In case of normal transmission: TEND flag is set
In case of transmit error: ERS flag is set
Steps (2) and (3) above are repeated until the TEND flag is set

Note: When the ERS flag is set, it should be cleared until transfer of the last bit (D7 in LSB-first transmission, D0 in MSB-first transmission) of the next transfer data to be transmitted has been completed.

Figure 14.5 Relation between Transmit Operation and Internal Registers

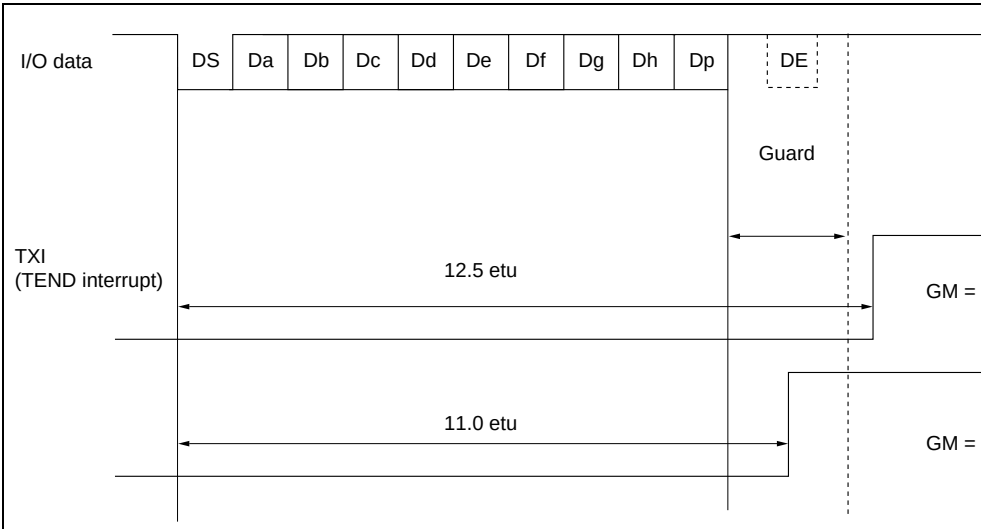

Figure 14.6 TEND Flag Occurrence Timing

Receiving Serial Data: The receiving procedure in smart card mode is the same as the normal SCI procedure. Figure 14.7 shows a flowchart for receiving.

1. Initialize the smart card interface by the procedure given in Initialization at the beginning of this section.
2. Check that the ORER and PER error flags are cleared to 0 in SSR. If either flag is set, carry out the necessary error handling, then clear both the ORER and PER flags to 0.
3. Check that the RDRF flag is set to 1. Repeat steps 2 and 3 until this check passes.
4. Read receive data from RDR.
5. To continue receiving data, clear the RDRF flag to 0 and return to step 2.
6. To terminate receiving, clear the RE bit to 0.

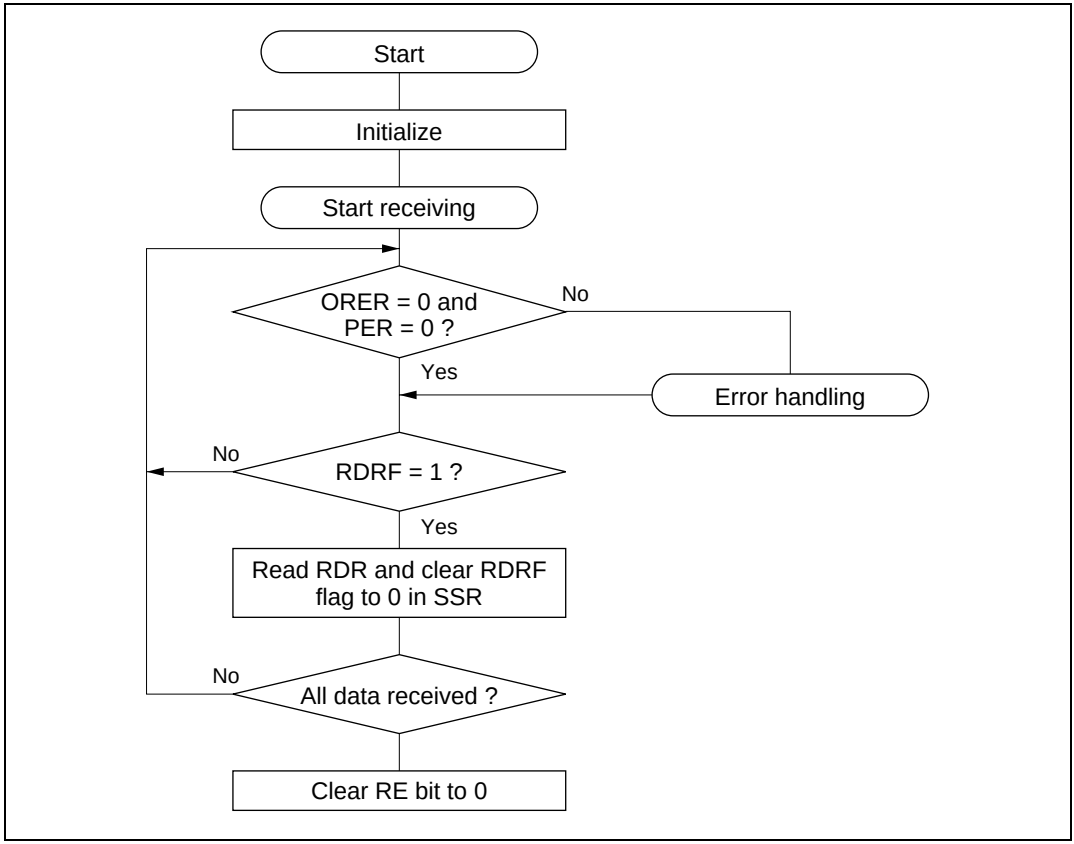

Figure 14.7 Receive Flowchart (Example)

This procedure may include interrupt handling and DMA transfer.

If the RIE bit is set to 1 to enable interrupt requests, when receiving is completed and the RDRF flag is set to 1, a receive-data-full interrupt (RXI) is requested. If a receive error occurs, either the ORER or PER flag is set to 1 and a transmit/receive-error interrupt (ERI) is requested.

If the RXI interrupt activates the DMAC, the number of bytes designated in the DMAC will be transferred, skipping receive data in which an error occurred.

For details, see Interrupt Operations and Data Transfer by DMAC below.

When a parity error occurs and PER is set to 1, the receive data is transferred to RDR, so the erroneous data can be read.

Switching Modes: To switch from receive mode to transmit mode, check that receiving operations have completed, then initialize the smart card interface, clearing RE to 0 and setting TE to 1. Completion of receive operations is indicated by the RDRF, PER, or ORER flag.

To switch from transmit mode to receive mode, check that transmitting operations have completed, then initialize the smart card interface, clearing TE to 0 and setting RE to 1. Completion of transmit operations can be verified from the TEND flag.

Fixing Clock Output: When the GM bit of the SMR is set to 1, clock output is fixed by CKE1 and CKE0 of SCR. In this case, the clock pulse can be set at minimum value.

Figure 14.8 shows clock output fixed timing: CKE0 is restricted with GM = 1 and CKE1 = 1.

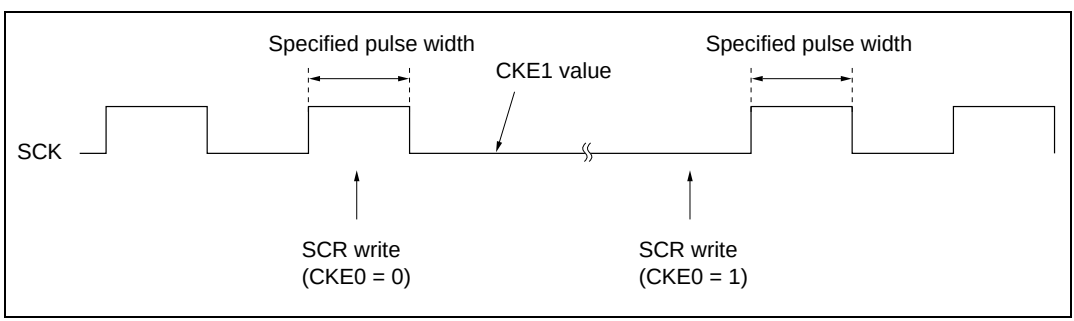

Figure 14.8 Clock Output Fixed Timing

Interrupt Operations: The smart card interface has three interrupt sources: transmit-data-empty (TXI), transmit/receive-error (ERI), and receive-data-full (RXI). The transmit-end interrupt request (TEI) is not available in smart card mode.

A TXI interrupt is requested when the TEND flag is set to 1 in SSR. An RXI interrupt is requested when the RDRF flag is set to 1 in SSR. An ERI interrupt is requested when the ORER, PER, or ERS flag is set to 1 in SSR. These relationships are shown in table 14.8.

Table 14.8 Smart Card Mode Operating States and Interrupt Sources

Operating State		Flag	Mask Bit	Interrupt Source	DMAC Activation
Transmit mode	Normal operation	TEND	TIE	TXI	Available
	Error	ERS	RIE	ERI	Not available
Receive mode	Normal operation	RDRF	RIE	RXI	Available
	Error	PER, ORER	RIE	ERI	Not available

Data Transfer by DMAC: The DMAC can be used to transmit and receive in smart card mode, as in normal SCI operations. In transmit mode, when the TEND flag is set to 1 in SSR, the TDRE flag is set simultaneously, generating a TXI interrupt. If TXI is designated in advance as a DMAC activation source, the DMAC will be activated by the TXI request and will transfer the next transmit data. This data transfer by the DMAC automatically clears the TDRE and TEND flags to 0. When an error occurs, the SCI automatically retransmits the same data, keeping TEND cleared to 0 so that the DMAC is not activated. The SCI and DMAC will therefore automatically transmit the designated number of bytes, including retransmission when an error occurs. When an error occurs the ERS flag is not cleared automatically, so the RIE bit should be set to 1 to enable the error to generate an ERI request, and the ERI interrupt handler should clear ERS.

When using the DMAC to transmit or receive, first set up and enable the DMAC, then make SCI settings. DMAC settings are described in section 8, DMA Controller.

In receive operations, when the RDRF flag is set to 1 in SSR, an RXI interrupt is requested. If RXI is designated in advance as a DMAC activation source, the DMAC will be activated by the RXI request and will transfer the received data. This data transfer by the DMAC automatically clears the RDRF flag to 0. When an error occurs, the RDRF flag is not set and an error flag is set instead. The DMAC is not activated. The ERI interrupt request is directed to the CPU. The ERI interrupt handler should clear the error flags.

Examples of Operation in GSM Mode: When switching between smart card interface mode and software standby mode, use the following procedures to maintain the clock duty cycle.

- Switching from smart card interface mode to software standby mode
  1. Set the $P9_4$ data register (DR) and data direction register (DDR) to the values for the fixed output state in software standby mode.
  2. Write 0 to the TE and RE bits in the serial control register (SCR) to stop transmit/receive operations. At the same time, set the CKE1 bit to the value for the fixed output state in software standby mode.
  3. Write 0 to the CKE0 bit in SCR to stop the clock.
  4. Wait for one serial clock cycle. During this period, the duty cycle is preserved and clock output is fixed at the specified level.
  5. Write H'00 to the serial mode register (SMR) and smart card mode register (SCMR).
  6. Make the transition to the software standby state.

- Returning from software standby mode to smart card interface mode
  1. Clear the software standby state.
  2. Set the CKE1 bit in SCR to the value for the fixed output state at the start of software standby (the current $P9_4$ pin state).
  3. Set smart card interface mode and output the clock. Clock signal generation is started with the normal duty cycle.

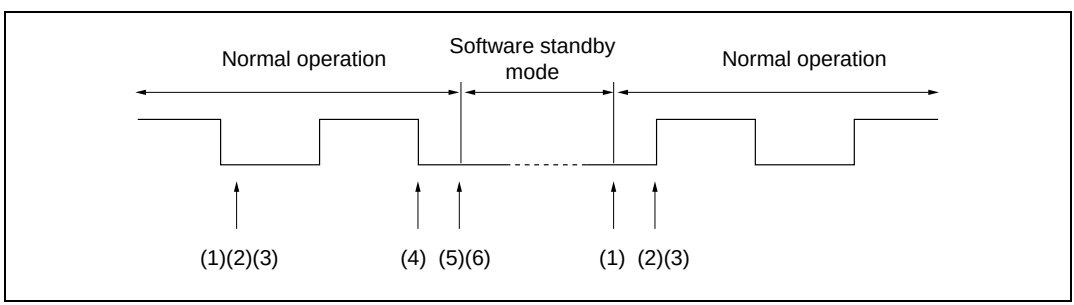

Figure 14.9 Procedure for Stopping and Restarting the Clock

Use the following procedure to secure the clock duty cycle after powering on.

1. The initial state is port input and high impedance. Use pull-up or pull-down resistors to fix the potential.
2. Fix at the output specified by the CKE1 bit in SCR.
3. Set SMR and SCMR, and switch to smart card interface mode operation.
4. Set the CKE0 bit in SCR to 1 to start clock output.

14.4 Usage Notes

When using the SCI as a smart card interface, note the following points.

Receive Data Sampling Timing in Smart Card Mode and Receive Margin: In smart card mode the SCI operates on a base clock with 372 times the bit rate frequency. In receiving, the SCI synchronizes internally with the fall of the start bit, which it samples on the base clock. Receive data is latched at the rising edge of the 186th base clock pulse. See figure 14.10.

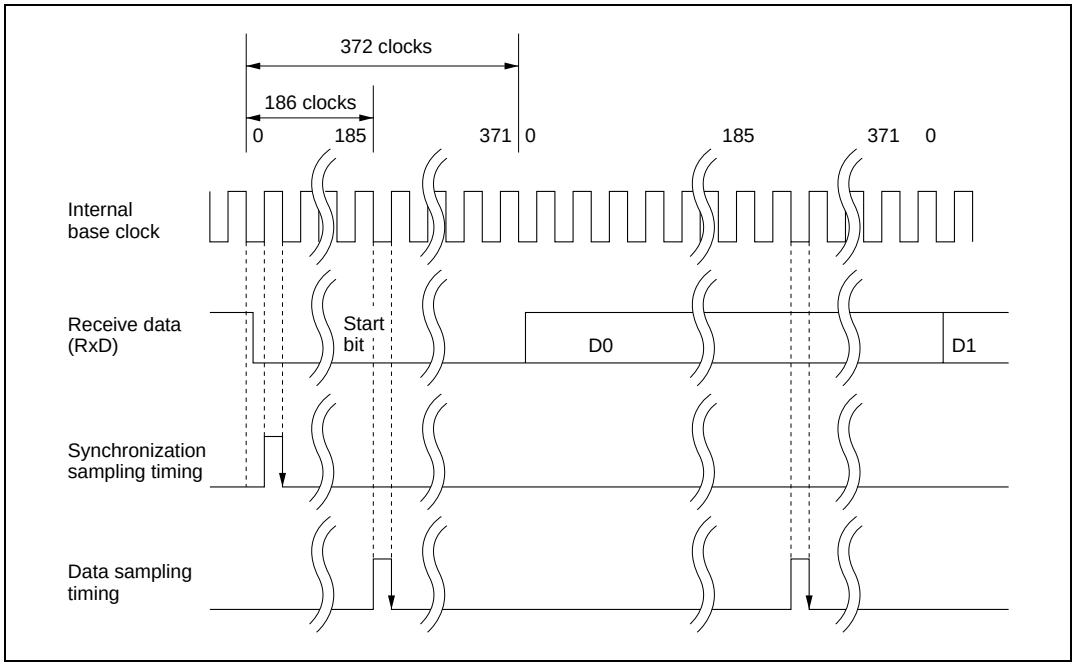

Figure 14.10 Receive Data Sampling Timing in Smart Card Mode

The receive margin can therefore be expressed as follows.

Receive margin in smart card mode:

$$M = \left| \left\{ 0.5 - \frac{1}{2N} \right\} - (L - 0.5)\,F - \frac{|D - 0.5|}{N}\,(1 + F) \right| \times 100\%$$

M: Receive margin (%)
N: Ratio of clock frequency to bit rate (N = 372)
D: Clock duty cycle (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute deviation of clock frequency

From this equation, if F = 0 and D = 0.5 the receive margin is as follows.

$$D = 0.5, F = 0$$
$$M = \{0.5 - 1/(2 \times 372)\} \times 100\%$$
$$= 49.866\%$$

Retransmission: Retransmission is described below for the separate cases of transmit mode and receive mode.

- Retransmission when SCI is in Receive Mode (See Figure 14.11)
  1. The SCI checks the received parity bit. If it detects an error, it automatically sets the PER flag to 1. If the RIE bit in SCR is set to the enable state, an ERI interrupt is requested. The PER flag should be cleared to 0 in SSR before the next parity bit sampling timing.
  2. The RDRF bit in SSR is not set to 1 for the error frame.
  3. If an error is not detected when the parity bit is checked, the PER flag is not set in SSR.
  4. If an error is not detected when the parity bit is checked, receiving operations are assumed to have ended normally, and the RDRF bit is automatically set to 1 in SSR. If the RIE bit in SCR is set to the enable state, an RXI interrupt is requested. If RXI is enabled as a DMA transfer activation source, the RDR contents can be read automatically. When the DMAC reads the RDR data, it automatically clears RDRF to 0.
  5. When a normal frame is received, at the error signal transmit timing, the data pin is held in the high-impedance state.

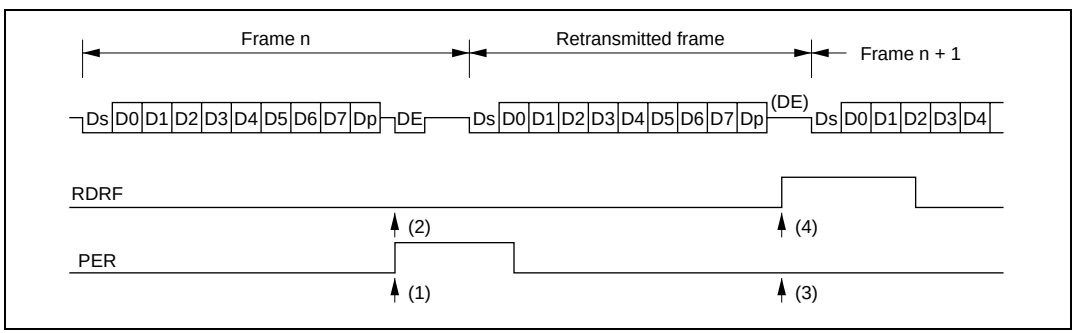

Figure 14.11 Retransmission in SCI Receive Mode

- Retransmission when SCI is in Transmit Mode (See Figure 14.12)
  6. After transmitting one frame, if the receiving device returns an error signal, the SCI sets the ERS flag to 1 in SSR. If the RIE bit in SCR is set to the enable state, an ERI interrupt is requested. The ERS flag should be cleared to 0 in SSR before the next parity bit sampling timing.
  7. The TEND bit in SSR is not set for the frame in which the error signal was received, indicating an error.
  8. If no error signal is returned from the receiving device, the ERS flag is not set in SSR.
  9. If no error signal is returned from the receiving device, transmission of the frame, including retransmission, is assumed to be complete, and the TEND bit is set to 1 in SSR. If the TIE bit in SCR is set to the enable state, a TXI interrupt is requested. If TXI is enabled as a DMA transfer activation source, the next data can be written in TDR automatically. When the DMAC writes data in TDR, it automatically clears the TDRE bit to 0.

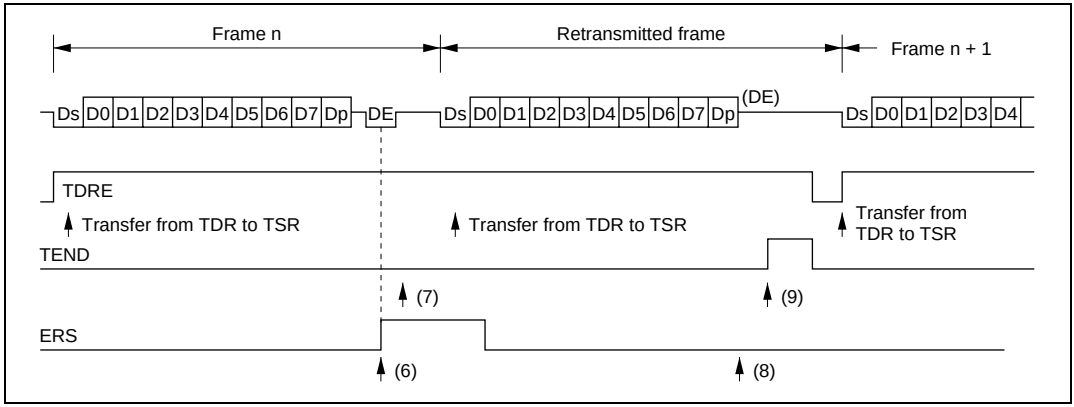

Figure 14.12 Retransmission in SCI Transmit Mode

Section 15 A/D Converter

15.1 Overview

The H8/3052BF includes a 10-bit successive-approximations A/D converter with a selection of up to eight analog input channels.

When the A/D converter is not used, it can be halted independently to conserve power. For details see section 20.6, Module Standby Function.

15.1.1 Features

A/D converter features are listed below.

- 10-bit resolution
- Eight input channels
- Selectable analog conversion voltage range
  The analog voltage conversion range can be programmed by input of an analog reference voltage at the V_{REF} pin.
- High-speed conversion
  Conversion time: maximum 5.4 μs per channel (with 25 MHz system clock)
- Two conversion modes
  Single mode: A/D conversion of one channel
  Scan mode: continuous conversion on one to four channels
- Four 16-bit data registers
  A/D conversion results are transferred for storage into data registers corresponding to the channels.
- Sample-and-hold function
- A/D conversion can be externally triggered
- A/D interrupt requested at end of conversion
  At the end of A/D conversion, an A/D end interrupt (ADI) can be requested.

15.1.2 Block Diagram

Figure 15.1 shows a block diagram of the A/D converter.

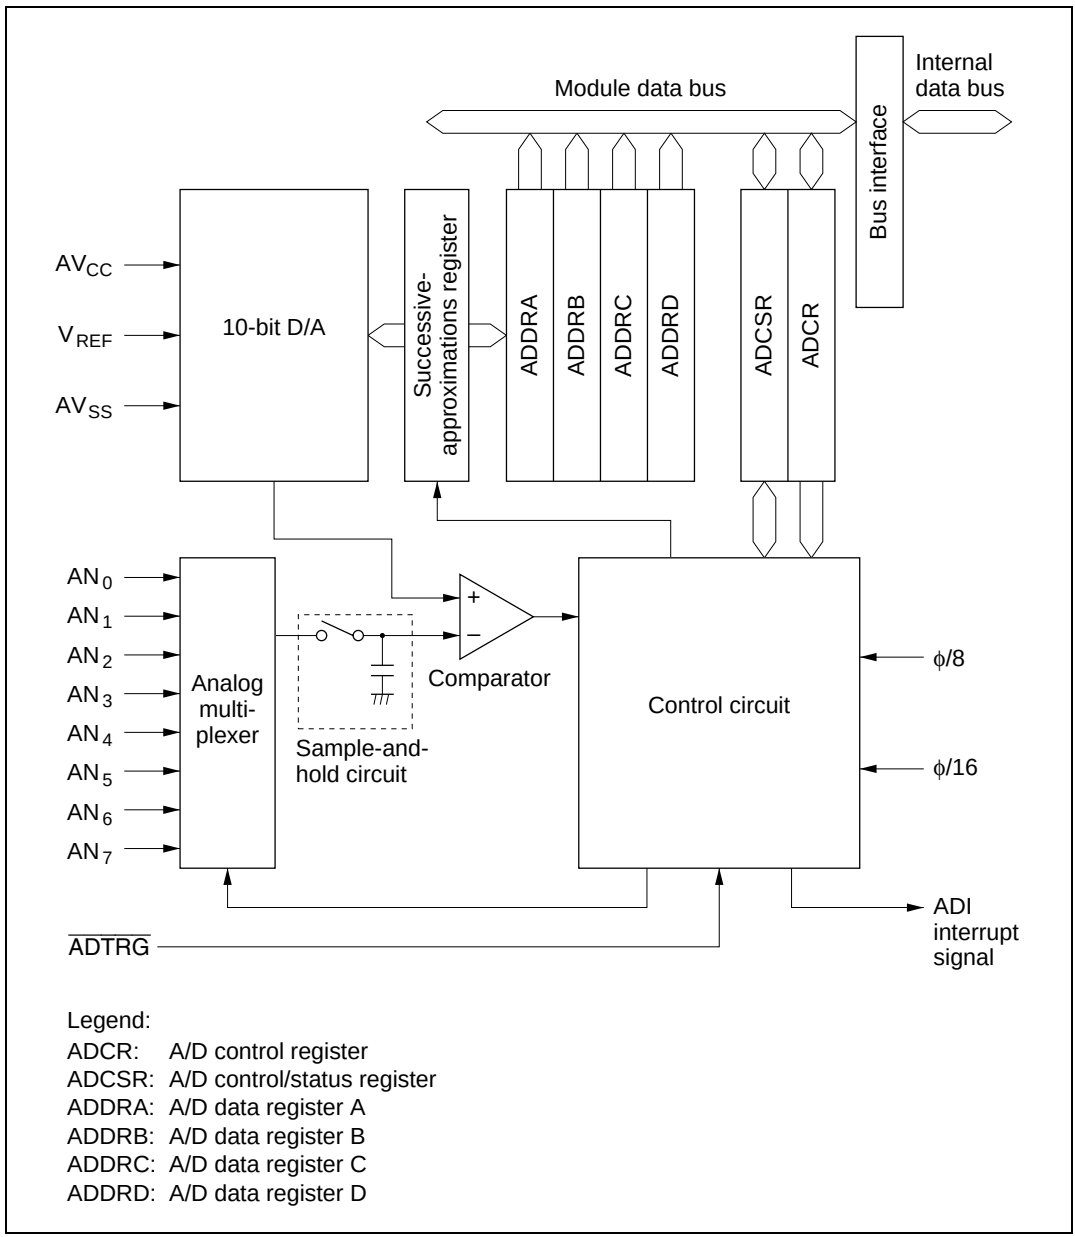

Figure 15.1 A/D Converter Block Diagram

15.1.3 Pin Configuration

Table 15.1 summarizes the A/D converter's input pins. The eight analog input pins are divided into two groups: group 0 (AN_0 to AN_3), and group 1 (AN_4 to AN_7). AV_{CC} and AV_{SS} are the power supply for the analog circuits in the A/D converter. V_{REF} is the A/D conversion reference voltage.

Table 15.1 A/D Converter Pins

Pin Name	Abbre-viation	I/O	Function
Analog power supply pin	AV_{CC}	Input	Analog power supply
Analog ground pin	AV_{SS}	Input	Analog ground and reference voltage
Reference voltage pin	V_{REF}	Input	Analog reference voltage
Analog input pin 0	AN_0	Input	Group 0 analog inputs
Analog input pin 1	AN_1	Input	
Analog input pin 2	AN_2	Input	
Analog input pin 3	AN_3	Input	
Analog input pin 4	AN_4	Input	Group 1 analog inputs
Analog input pin 5	AN_5	Input	
Analog input pin 6	AN_6	Input	
Analog input pin 7	AN_7	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input for starting A/D conversion

15.1.4 Register Configuration

Table 15.2 summarizes the A/D converter's registers.

Table 15.2 A/D Converter Registers

Address*1	Name	Abbreviation	R/W	Initial Value
H'FFE0	A/D data register A (high)	ADDRAH	R	H'00
H'FFE1	A/D data register A (low)	ADDRAL	R	H'00
H'FFE2	A/D data register B (high)	ADDRBH	R	H'00
H'FFE3	A/D data register B (low)	ADDRBL	R	H'00
H'FFE4	A/D data register C (high)	ADDRCH	R	H'00
H'FFE5	A/D data register C (low)	ADDRCL	R	H'00
H'FFE6	A/D data register D (high)	ADDRDH	R	H'00
H'FFE7	A/D data register D (low)	ADDRDL	R	H'00
H'FFE8	A/D control/status register	ADCSR	R/(W)*2	H'00
H'FFE9	A/D control register	ADCR	R/W	H'7E

Notes: 1. Lower 16 bits of the address
2. Only 0 can be written in bit 7, to clear the flag.

15.2 Register Descriptions

15.2.1 A/D Data Registers A to D (ADDRA to ADDRD)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRn	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write (n = A to D)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

A/D conversion data
10-bit data giving an A/D conversion result

Reserved bits

The four A/D data registers (ADDRA to ADDRD) are 16-bit read-only registers that store the results of A/D conversion.

An A/D conversion produces 10-bit data, which is transferred for storage into the A/D data register corresponding to the selected channel. The upper 8 bits of the result are stored in the upper byte of the A/D data register. The lower 2 bits are stored in the lower byte. Bits 5 to 0 of an A/D data register are reserved bits that are always read as 0. Table 15.3 indicates the pairings of analog input channels and A/D data registers.

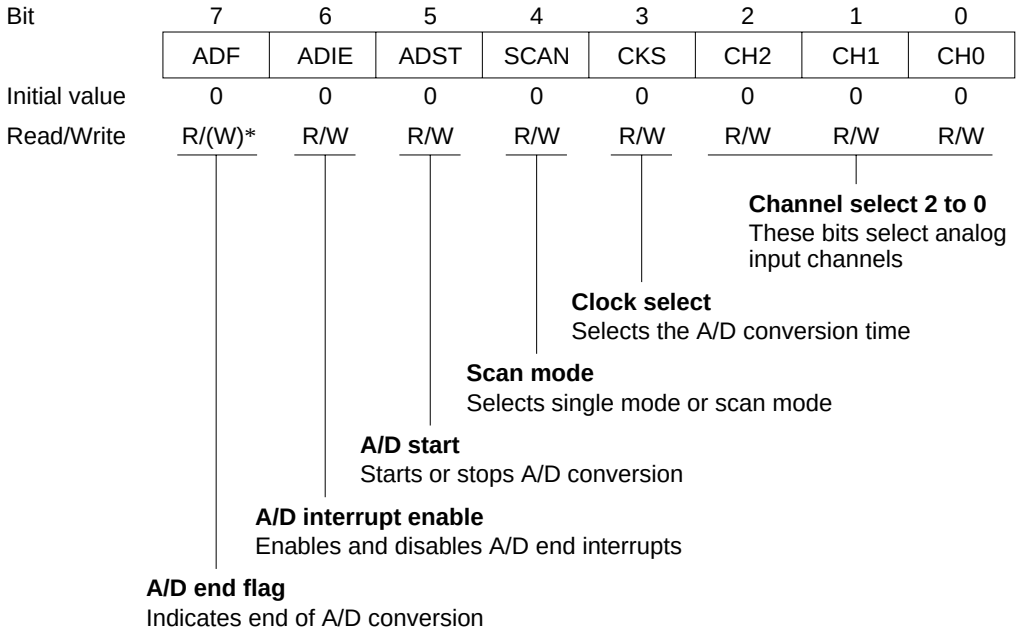
The CPU can always read and write the A/D data registers. The upper byte can be read directly, but the lower byte is read through a temporary register (TEMP). For details see section 15.3, CPU Interface.

The A/D data registers are initialized to H'0000 by a reset and in standby mode.

Table 15.3 Analog Input Channels and A/D Data Registers

Analog Input Channel		
Group 0	**Group 1**	**A/D Data Register**
AN_0	AN_4	ADDRA
AN_1	AN_5	ADDRB
AN_2	AN_6	ADDRC
AN_3	AN_7	ADDRD

15.2.2 A/D Control/Status Register (ADCSR)



Note: * Only 0 can be written, to clear the flag.

ADCSR is an 8-bit readable/writable register that selects the mode and controls the A/D converter. ADCSR is initialized to H'00 by a reset and in standby mode.

Bit 7—A/D End Flag (ADF): Indicates the end of A/D conversion.

Bit 7: ADF	Description	
0	[Clearing condition]	(Initial value)
	Cleared by reading ADF while ADF = 1, then writing 0 in ADF	
1	[Setting conditions]	
	• Single mode: A/D conversion ends	
	• Scan mode: A/D conversion ends in all selected channels	

Bit 6—A/D Interrupt Enable (ADIE): Enables or disables the interrupt (ADI) requested at the end of A/D conversion.

Bit 6: ADIE	Description	
0	A/D end interrupt request (ADI) is disabled	(Initial value)
1	A/D end interrupt request (ADI) is enabled	

Bit 5—A/D Start (ADST): Starts or stops A/D conversion. The ADST bit remains set to 1 during A/D conversion. It can also be set to 1 by external trigger input at the $\overline{\text{ADTRG}}$ pin.

Bit 5: ADST	Description	
0	A/D conversion is stopped	(Initial value)
1	Single mode: A/D conversion starts; ADST is automatically cleared to 0 when conversion ends. Scan mode: A/D conversion starts and continues, cycling among the selected channels, until ADST is cleared to 0 by software, by a reset, or by a transition to standby mode.	

Bit 4—Scan Mode (SCAN): Selects single mode or scan mode. For further information on operation in these modes, see section 15.4, Operation. Clear the ADST bit to 0 before switching the conversion mode.

Bit 4: SCAN	Description	
0	Single mode	(Initial value)
1	Scan mode	

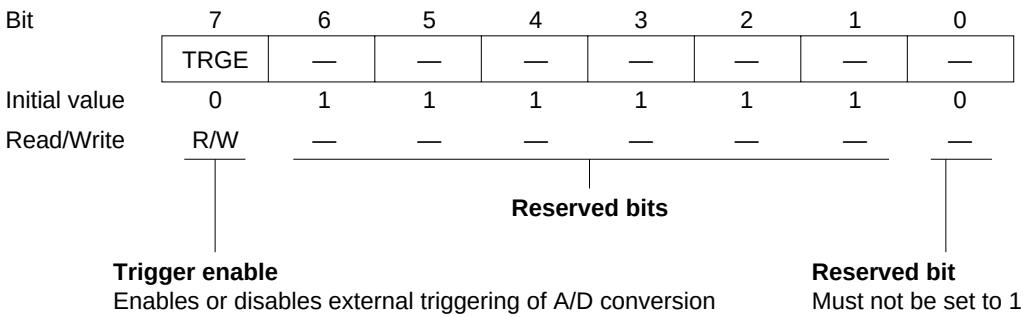
Bit 3—Clock Select (CKS): Selects the A/D conversion time. Clear the ADST bit to 0 before switching the conversion time.

Bit 3: CKS	Description	
0	Conversion time = 266 states (maximum)	(Initial value)
1	Conversion time = 134 states (maximum)	

Bits 2 to 0—Channel Select 2 to 0 (CH2 to CH0): These bits and the SCAN bit select the analog input channels. Clear the ADST bit to 0 before changing the channel selection.

Group Selection	Channel Selection		Description	
CH2	**CH1**	**CH0**	**Single Mode**	**Scan Mode**
0	0	0	AN_0 (Initial value)	AN_0
		1	AN_1	AN_0, AN_1
	1	0	AN_2	AN_0 to AN_2
		1	AN_3	AN_0 to AN_3
1	0	0	AN_4	AN_4
		1	AN_5	AN_4, AN_5
	1	0	AN_6	AN_4 to AN_6
		1	AN_7	AN_4 to AN_7

15.2.3 A/D Control Register (ADCR)



ADCR is an 8-bit readable/writable register that enables or disables external triggering of A/D conversion. ADCR is initialized to H'7E by a reset and in standby mode.

Bit 7—Trigger Enable (TRGE): Enables or disables external triggering of A/D conversion.

Bit 7: TRGE	Description	
0	A/D conversion cannot be externally triggered	(Initial value)
1	A/D conversion starts at the falling edge of the external trigger signal ($\overline{\text{ADTRG}}$)	

Bits 6 to 1—Reserved: Read-only bits, always read as 1.

Bit 0—Reserved: Do not set to 1.

15.3 CPU Interface

ADDRA to ADDRD are 16-bit registers, but they are connected to the CPU by an 8-bit data bus. Therefore, although the upper byte can be be accessed directly by the CPU, the lower byte is read through an 8-bit temporary register (TEMP).

An A/D data register is read as follows. When the upper byte is read, the upper-byte value is transferred directly to the CPU and the lower-byte value is transferred into TEMP. Next, when the lower byte is read, the TEMP contents are transferred to the CPU.

When reading an A/D data register, always read the upper byte before the lower byte. It is possible to read only the upper byte, but if only the lower byte is read, incorrect data may be obtained.

Figure 15.2 shows the data flow for access to an A/D data register.

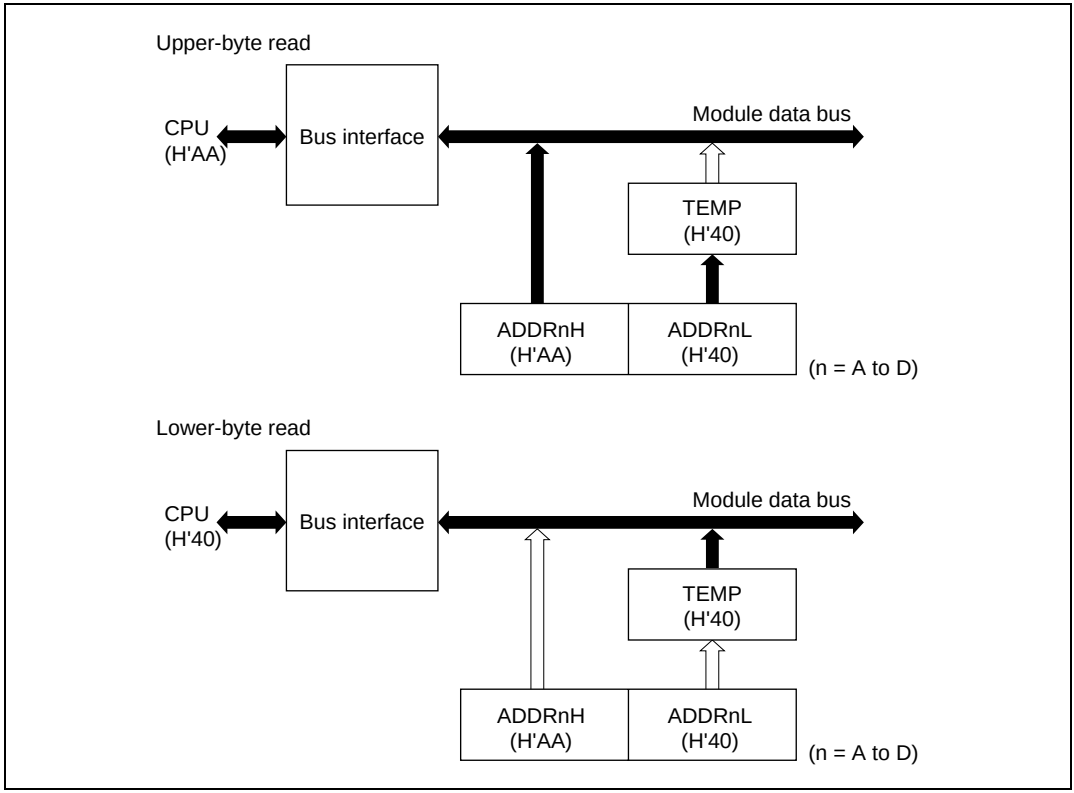


Figure 15.2 A/D Data Register Access Operation (Reading H'AA40)

15.4 Operation

The A/D converter operates by successive approximations with 10-bit resolution. It has two operating modes: single mode and scan mode.

15.4.1 Single Mode (SCAN = 0)

Single mode should be selected when only one A/D conversion on one channel is required. A/D conversion starts when the ADST bit is set to 1 by software, or by external trigger input. The ADST bit remains set to 1 during A/D conversion and is automatically cleared to 0 when conversion ends.

When conversion ends the ADF bit is set to 1. If the ADIE bit is also set to 1, an ADI interrupt is requested at this time. To clear the ADF flag to 0, first read ADCSR, then write 0 in ADF.

When the mode or analog input channel must be switched during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel is changed.

Typical operations when channel 1 (AN_1) is selected in single mode are described next.

Figure 15.3 shows a timing diagram for this example.

1. Single mode is selected (SCAN = 0), input channel AN_1 is selected (CH2 = CH1 = 0, CH0 = 1), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the result is transferred into ADDRB. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADCSR, then writes 0 in the ADF flag.
6. The routine reads and processes the conversion result (ADDRB).
7. Execution of the A/D interrupt handling routine ends. After that, if the ADST bit is set to 1, A/D conversion starts again and steps 2 to 7 are repeated.

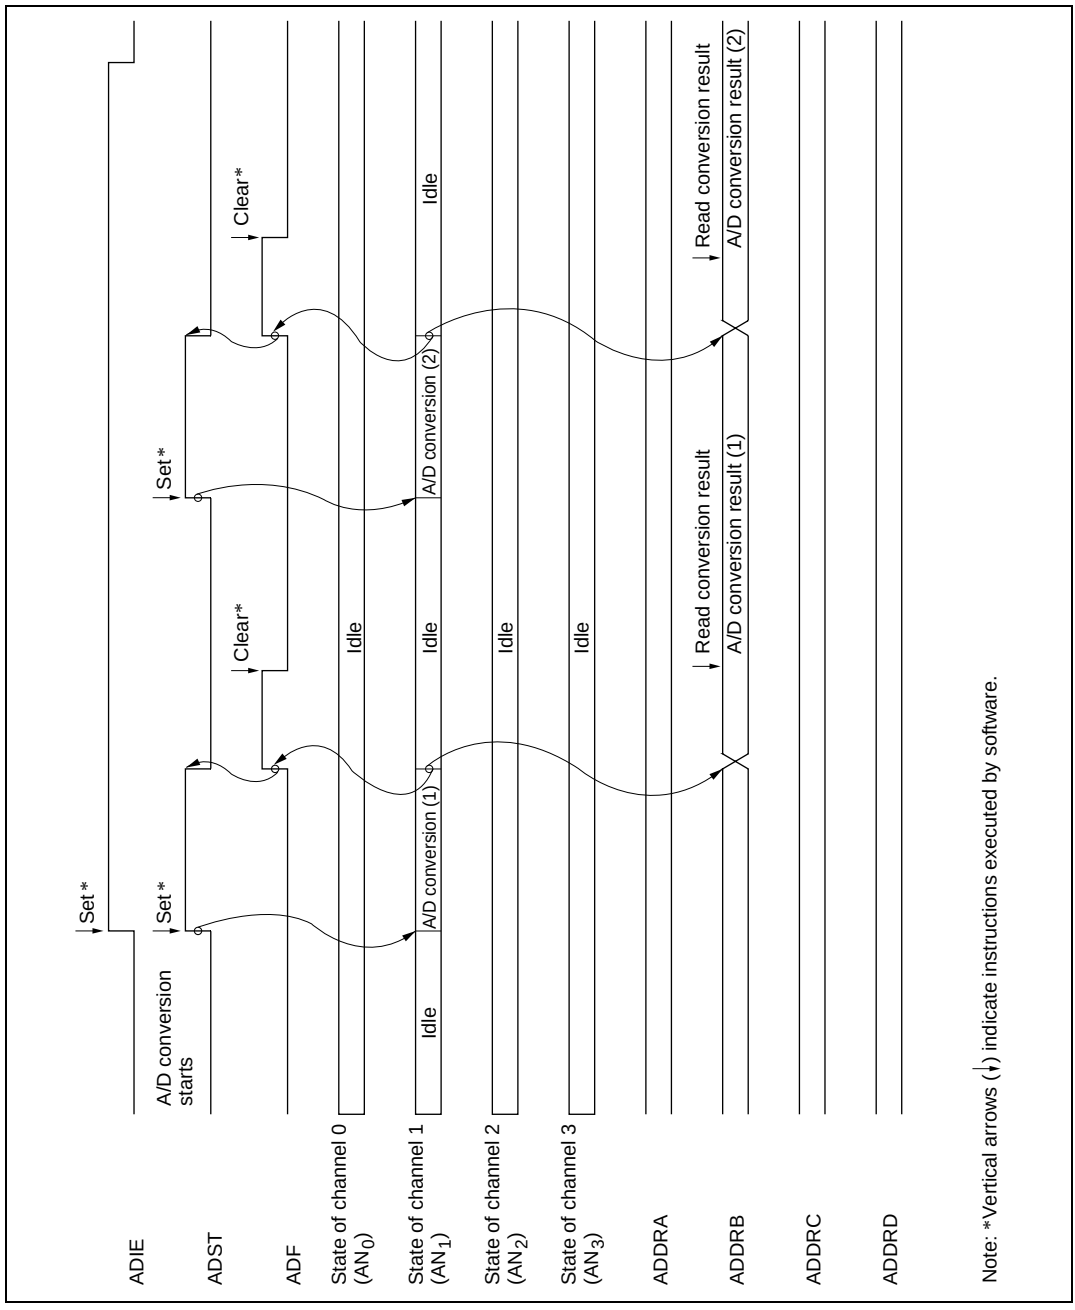

Figure 15.3 Example of A/D Converter Operation (Single Mode, Channel 1 Selected)

15.4.2 Scan Mode (SCAN = 1)

Scan mode is useful for monitoring analog inputs in a group of one or more channels. When the ADST bit is set to 1 by software or external trigger input, A/D conversion starts on the first channel in the group (AN_0 when CH2 = 0, AN_4 when CH2 = 1). When two or more channels are selected, after conversion of the first channel ends, conversion of the second channel (AN_1 or AN_5) starts immediately. A/D conversion continues cyclically on the selected channels until the ADST bit is cleared to 0. The conversion results are transferred for storage into the A/D data registers corresponding to the channels.

When the mode or analog input channel selection must be changed during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels in group 0 (AN_0 to AN_2) are selected in scan mode are described next. Figure 15.4 shows a timing diagram for this example.

1. Scan mode is selected (SCAN = 1), scan group 0 is selected (CH2 = 0), analog input channels AN_0 to AN_2 are selected (CH1 = 1, CH0 = 0), and A/D conversion is started (ADST = 1).
2. When A/D conversion of the first channel (AN_0) is completed, the result is transferred into ADDRA. Next, conversion of the second channel (AN_1) starts automatically.
3. Conversion proceeds in the same way through the third channel (AN_2).
4. When conversion of all selected channels (AN_0 to AN_2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN_0) starts again. If the ADIE bit is set to 1, an ADI interrupt is requested at this time.
5. Steps 2 to 4 are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion stops. After that, if the ADST bit is set to 1, A/D conversion starts again from the first channel (AN_0).

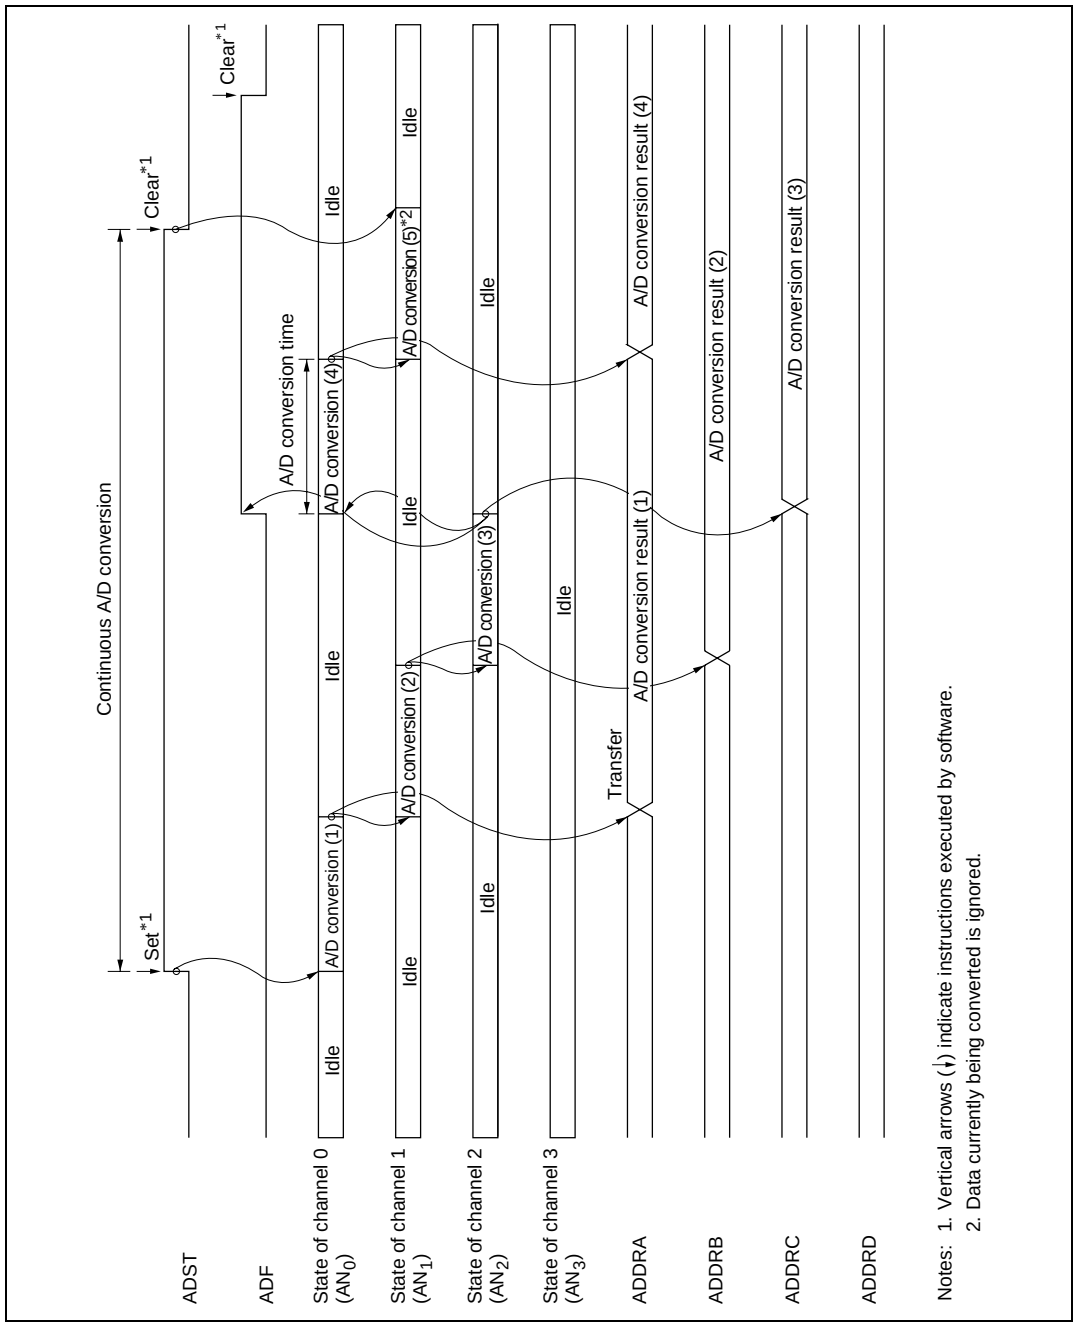

Figure 15.4 Example of A/D Converter Operation (Scan Mode, Channels AN_0 to AN_2 Selected)

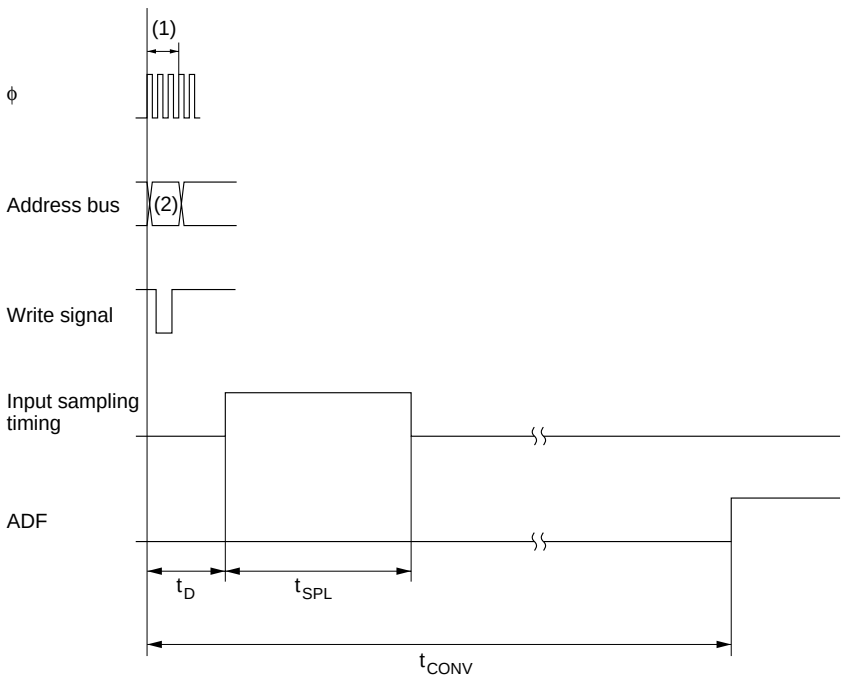
15.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at a time t_D after the ADST bit is set to 1, then starts conversion. Figure 15.5 shows the A/D conversion timing. Table 15.4 indicates the A/D conversion time.

As indicated in figure 15.5, the A/D conversion time includes t_D and the input sampling time. The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 15.4.

In scan mode, the values given in table 15.4 apply to the first conversion. In the second and subsequent conversions the conversion time is fixed at 256 states when CKS = 0 or 128 states when CKS = 1.



Legend:
(1): ADCSR write cycle
(2): ADCSR address
t_D: Synchronization delay
t_{SPL}: Input sampling time
t_{CONV}: A/D conversion time

Figure 15.5 A/D Conversion Timing

Table 15.4 A/D Conversion Time (Single Mode)

		CKS = 0			CKS = 1		
	Symbol	**Min**	**Typ**	**Max**	**Min**	**Typ**	**Max**
Synchronization delay	t_D	10	—	17	6	—	9
Input sampling time	t_{SPL}	—	63	—	—	31	—
A/D conversion time	t_{CONV}	259	—	266	131	—	134

Note: Values in the table are numbers of states.

15.4.4 External Trigger Input Timing

A/D conversion can be externally triggered. When the TRGE bit is set to 1 in ADCR, external trigger input is enabled at the $\overline{\text{ADTRG}}$ pin. A high-to-low transition at the $\overline{\text{ADTRG}}$ pin sets the ADST bit to 1 in ADCSR, starting A/D conversion. Other operations, in both single and scan modes, are the same as if the ADST bit had been set to 1 by software. Figure 15.6 shows the timing.

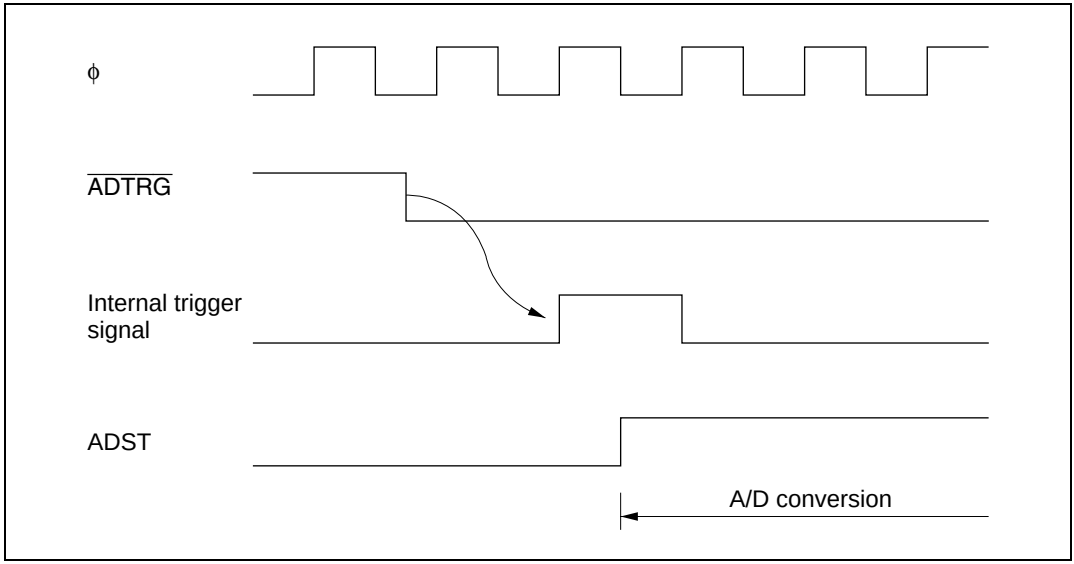


Figure 15.6 External Trigger Input Timing

15.5 Interrupts

The A/D converter generates an interrupt (ADI) at the end of A/D conversion. The ADI interrupt request can be enabled or disabled by the ADIE bit in ADCSR.

15.6 Usage Notes

When using the A/D converter, note the following points:

1. Note on Board Design

   In board layout, separate the digital circuits from the analog circuits as much as possible. Particularly avoid layouts in which the signal lines of digital circuits cross or closely approach the signal lines of analog circuits. Induction and other effects may cause the analog circuits to operate incorrectly, or may adversely affect the accuracy of A/D conversion.

   The analog input signals (AN_0 to AN_7), analog reference voltage (V_{REF}), and analog supply voltage (AV_{CC}) must be separated from digital circuits by the analog ground (AV_{SS}). The analog ground (AV_{SS}) should be connected to a stable digital ground (V_{SS}) at one point on the board.

2. Note on Noise

   To prevent damage from surges and other abnormal voltages at the analog input pins (AN_0 to AN_7) and analog reference voltage pin (V_{REF}), connect a protection circuit like the one in figure 15.7 between AV_{CC} and AV_{SS}. The bypass capacitors connected to AV_{CC} and V_{REF} and the filter capacitors connected to AN_0 to AN_7 must be connected to AV_{SS}. If filter capacitors like the ones in figure 15.7 are connected, the voltage values input to the analog input pins (AN_0 to AN_7) will be smoothed, which may give rise to error. Error can also occur if A/D conversion is frequently performed in scan mode so that the current that charges and discharges the capacitor in the sample-and-hold circuit of the A/D converter becomes greater than that input to the analog input pins via input impedance R_{in}. The circuit constants should therefore be selected carefully.

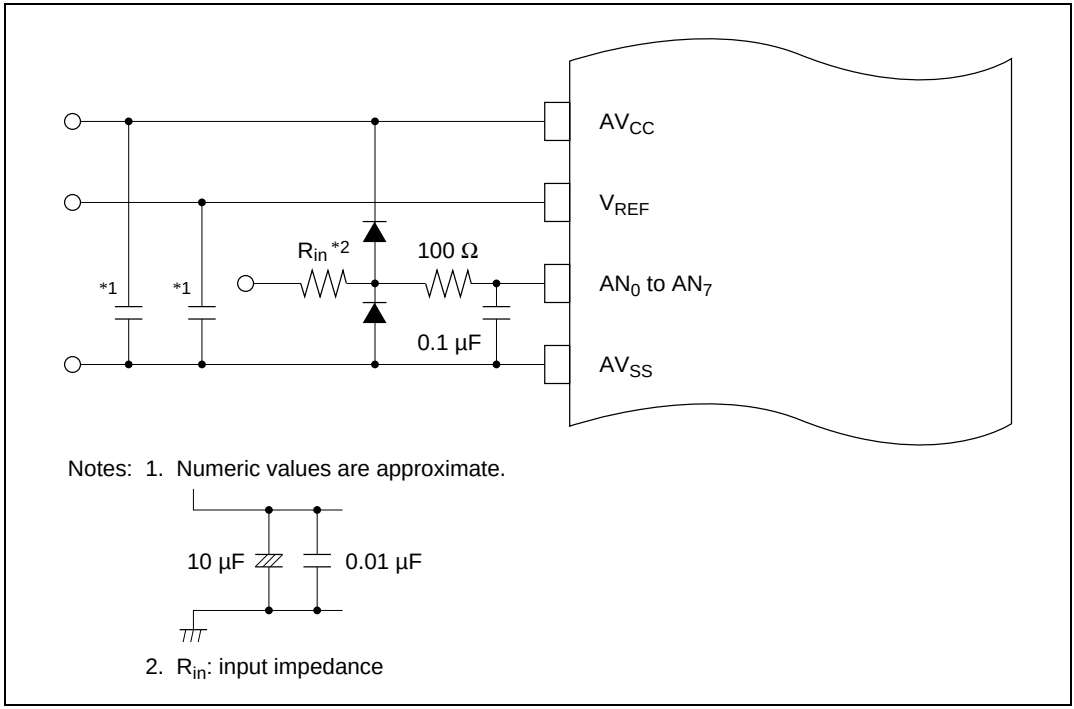

Figure 15.7 Example of Analog Input Protection Circuit

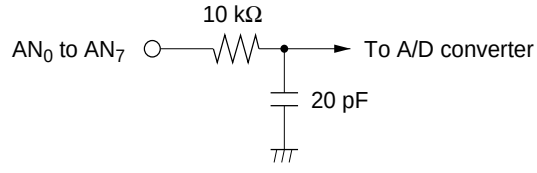
Table 15.5 Analog Input Pin Ratings

Item	Min	Max	Unit
Analog input capacitance	—	20	pF
Allowable signal-source impedance	—	10*	kΩ

Note: * When V_{CC} = 4.0 V to 5.5 V and $\phi \leq$ 12 MHz.For details, refer to section 21, Electrical Characteristics.



Note: Numeric values are approximate.

Figure 15.8 Analog Input Pin Equivalent Circuit

3. A/D Conversion Accuracy Definitions

   A/D conversion accuracy in the H8/3052BF is defined as follows:

   - Resolution

     Digital output code length of A/D converter
   - Offset error

     Deviation from ideal A/D conversion characteristic of analog input voltage required to raise digital output from minimum voltage value 0000000000 to 0000000001 (figure 15.10)
   - Full-scale error

     Deviation from ideal A/D conversion characteristic of analog input voltage required to raise digital output from 1111111110 to 1111111111 (figure 15.10)
   - Quantization error

     Intrinsic error of the A/D converter; 1/2 LSB (figure 15.9)
   - Nonlinearity error

     Deviation from ideal A/D conversion characteristic in range from zero volts to full scale, exclusive of offset error, full-scale error, and quantization error.
   - Absolute accuracy

     Deviation of digital value from analog input value, including offset error, full-scale error, quantization error, and nonlinearity error.

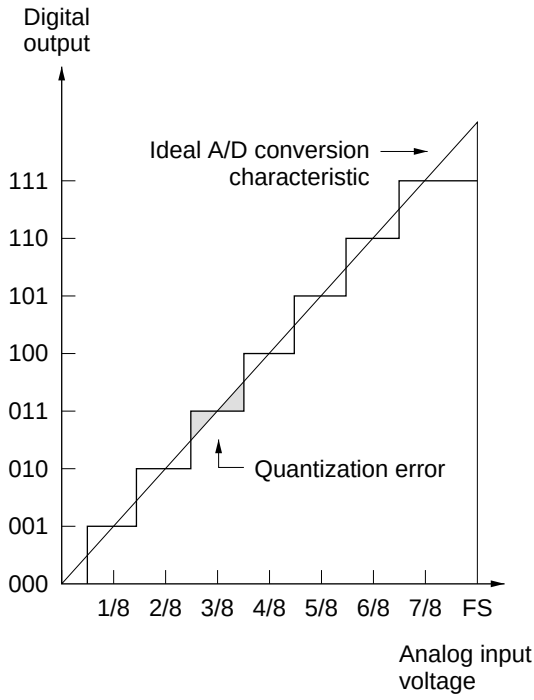


Figure 15.9 A/D Converter Accuracy Definitions (1)

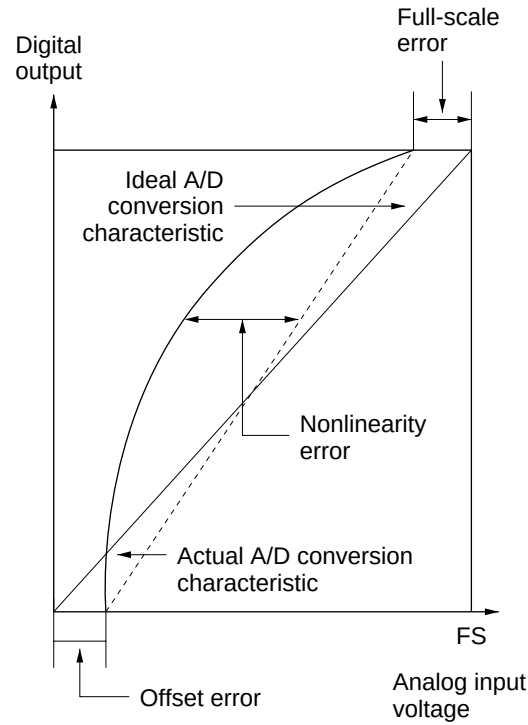

Figure 15.10 A/D Converter Accuracy Definitions (2)

4. Allowable Signal-Source Impedance

   The analog inputs of the H8/3052BF are designed to assure accurate conversion of input signals with a signal-source impedance not exceeding 10 kΩ. The reason for this rating is that it enables the input capacitor in the sample-and-hold circuit in the A/D converter to charge within the sampling time. If the sensor output impedance exceeds 10 kΩ, charging may be inadequate and the accuracy of A/D conversion cannot be guaranteed.

   If a large external capacitor is provided in scan mode, then the internal 10-kΩ input resistance becomes the only significant load on the input. In this case the impedance of the signal source is not a problem.

   A large external capacitor, however, acts as a low-pass filter. This may make it impossible to track analog signals with high dv/dt (e.g. a variation of 5 mV/µs) (figure 15.11). To convert high-speed analog signals or to use scan mode, insert a low-impedance buffer.

5. Effect on Absolute Accuracy

   Attaching an external capacitor creates a coupling with ground, so if there is noise on the ground line, it may degrade absolute accuracy. The capacitor must be connected to an electrically stable ground, such as AV_{SS}.

   If a filter circuit is used, be careful of interference with digital signals on the same board, and make sure the circuit does not act as an antenna.

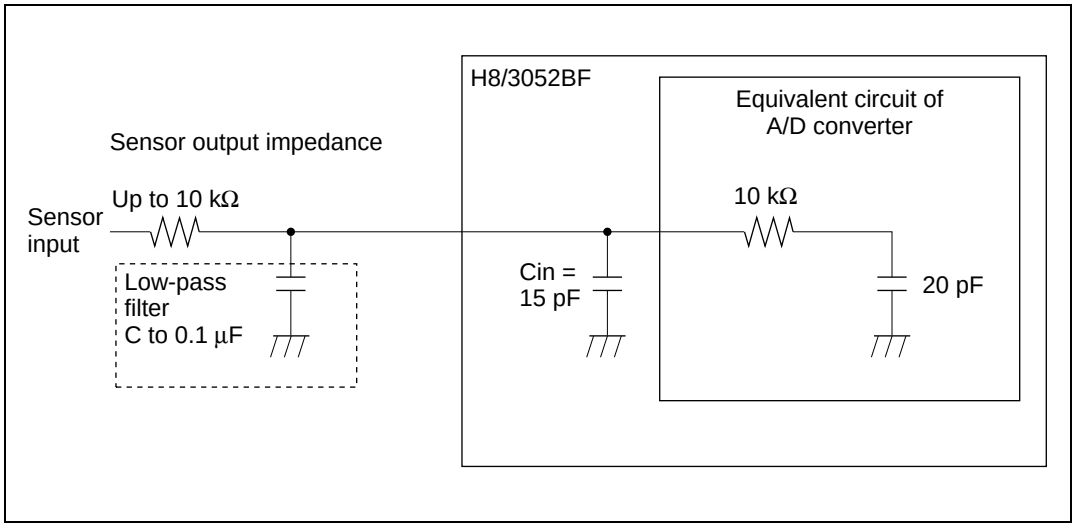

Figure 15.11 Analog Input Circuit (Example)

Section 16 D/A Converter

16.1 Overview

The H8/3052BF includes a D/A converter with two channels.

16.1.1 Features

D/A converter features are listed below.

- Eight-bit resolution
- Two output channels
- Conversion time: maximum 10 µs (with 20-pF capacitive load)
- Output voltage: 0 V to V_{REF}
- D/A outputs can be sustained in software standby mode

16.1.2 Block Diagram

Figure 16.1 shows a block diagram of the D/A converter.

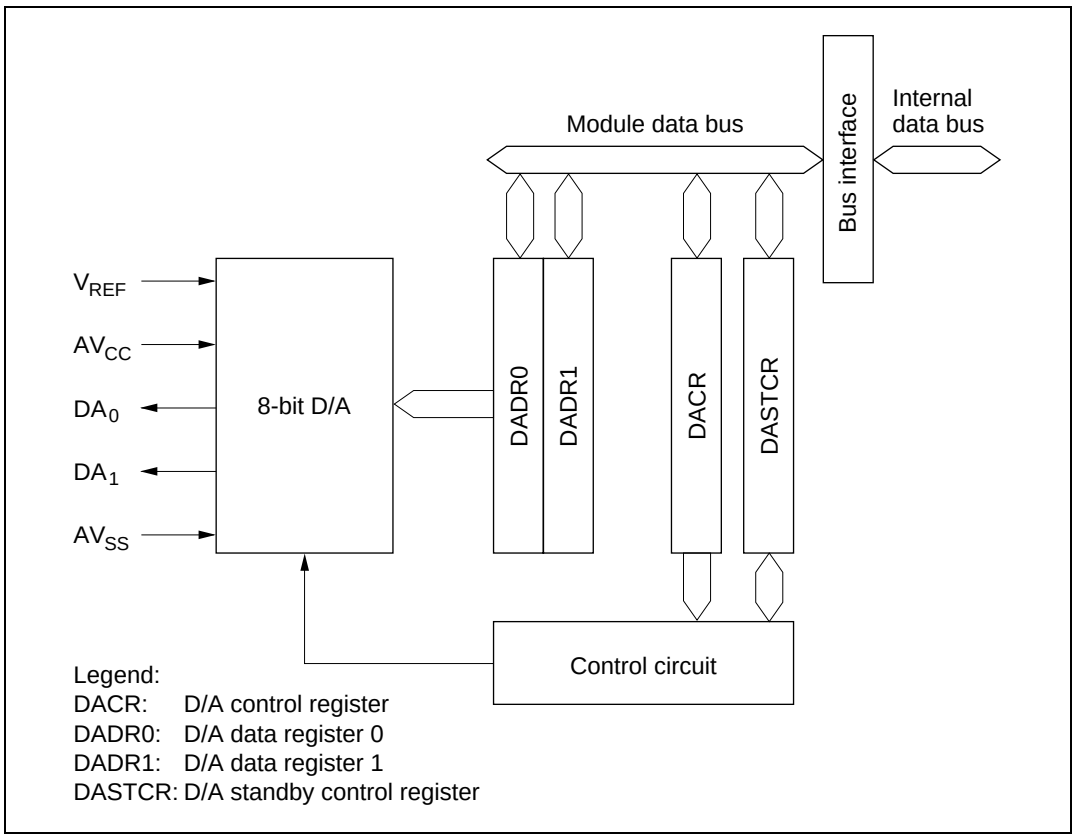

Figure 16.1 D/A Converter Block Diagram

16.1.3 Pin Configuration

Table 16.1 summarizes the D/A converter's input and output pins.

Table 16.1 D/A Converter Pins

Pin Name	Abbreviation	I/O	Function
Analog power supply pin	AV_{CC}	Input	Analog power supply
Analog ground pin	AV_{SS}	Input	Analog ground and reference voltage
Analog output pin 0	DA_0	Output	Analog output, channel 0
Analog output pin 1	DA_1	Output	Analog output, channel 1
Reference voltage input pin	V_{REF}	Input	Analog reference voltage

16.1.4 Register Configuration

Table 16.2 summarizes the D/A converter's registers.

Table 16.2 D/A Converter Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFDC	D/A data register 0	DADR0	R/W	H'00
H'FFDD	D/A data register 1	DADR1	R/W	H'00
H'FFDE	D/A control register	DACR	R/W	H'1F
H'FF5C	D/A standby control register	DASTCR	R/W	H'FE

Note: * Lower 16 bits of the address

16.2 Register Descriptions

16.2.1 D/A Data Registers 0 and 1 (DADR0/1)

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The D/A data registers (DADR0 and DADR1) are 8-bit readable/writable registers that store the data to be converted. When analog output is enabled, the D/A data register values are constantly converted and output at the analog output pins.

The D/A data registers are initialized to H'00 by a reset and in standby mode.

16.2.2 D/A Control Register (DACR)

Bit	7	6	5	4	3	2	1	0
	DAOE1	DAOE0	DAE	—	—	—	—	—
Initial value	0	0	0	1	1	1	1	1
Read/Write	R/W	R/W	R/W	—	—	—	—	—

D/A enable
Controls D/A conversion

D/A output enable 0
Controls D/A conversion and analog output

D/A output enable 1
Controls D/A conversion and analog output

DACR is an 8-bit readable/writable register that controls the operation of the D/A converter. DACR is initialized to H'1F by a reset and in standby mode.

Bit 7—D/A Output Enable 1 (DAOE1): Controls D/A conversion and analog output.

Bit 7: DAOE1	Description	
0	DA_1 analog output is disabled	(Initial value)
1	Channel-1 D/A conversion and DA_1 analog output are enabled	

Bit 6—D/A Output Enable 0 (DAOE0): Controls D/A conversion and analog output.

Bit 6: DAOE0	Description	
0	DA_0 analog output is disabled	(Initial value)
1	Channel-0 D/A conversion and DA_0 analog output are enabled	

Bit 5—D/A Enable (DAE): Controls D/A conversion, together with bits DAOE0 and DAOE1. When the DAE bit is cleared to 0, analog conversion is controlled independently in channels 0 and 1. When the DAE bit is set to 1, analog conversion is controlled together in channels 0 and 1. Output of the conversion results is always controlled independently by DAOE0 and DAOE1.

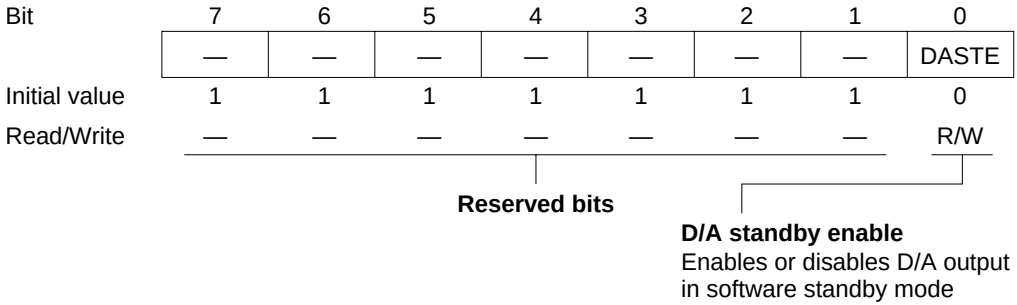
Bit 7: DAOE1	Bit 6: DAOE0	Bit 5: DAE	Description
0	0	—	D/A conversion is disabled in channels 0 and 1
	1	0	D/A conversion is enabled in channel 0
			D/A conversion is disabled in channel 1
		1	D/A conversion is enabled in channels 0 and 1
1	0	0	D/A conversion is disabled in channel 0
			D/A conversion is enabled in channel 1
		1	D/A conversion is enabled in channels 0 and 1
	1	—	D/A conversion is enabled in channels 0 and 1

When the DAE bit is set to 1, even if bits DAOE0 and DAOE1 in DACR and the ADST bit in ADCSR are cleared to 0, the same current is drawn from the analog power supply as during A/D and D/A conversion.

Bits 4 to 0—Reserved: Read-only bits, always read as 1.

16.2.3 D/A Standby Control Register (DASTCR)

DASTCR is an 8-bit readable/writable register that enables or disables D/A output in software standby mode.



DASTCR is initialized to H'FE by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 1—Reserved: Read-only bits, always read as 1.

Bit 0—D/A Standby Enable (DASTE): Enables or disables D/A output in software standby mode.

Bit 0: DASTE	Description	
0	D/A output is disabled in software standby mode	(Initial value)
1	D/A output is enabled in software standby mode	

16.3 Operation

The D/A converter has two built-in D/A conversion circuits that can perform conversion independently.

D/A conversion is performed constantly while enabled in DACR. If the DADR0 or DADR1 value is modified, conversion of the new data begins immediately. The conversion results are output when bits DAOE0 and DAOE1 are set to 1.

An example of D/A conversion on channel 0 is given next. Timing is indicated in figure 16.2.

1. Data to be converted is written in DADR0.
2. Bit DAOE0 is set to 1 in DACR. D/A conversion starts and DA_0 becomes an output pin. The converted result is output after the conversion time. The output value is (DADR0 contents/256) $\times V_{REF}$. Output of this conversion result continues until the value in DADR0 is modified or the DAOE0 bit is cleared to 0.
3. If the DADR0 value is modified, conversion starts immediately, and the result is output after the conversion time.
4. When the DAOE0 bit is cleared to 0, DA_0 becomes an input pin.

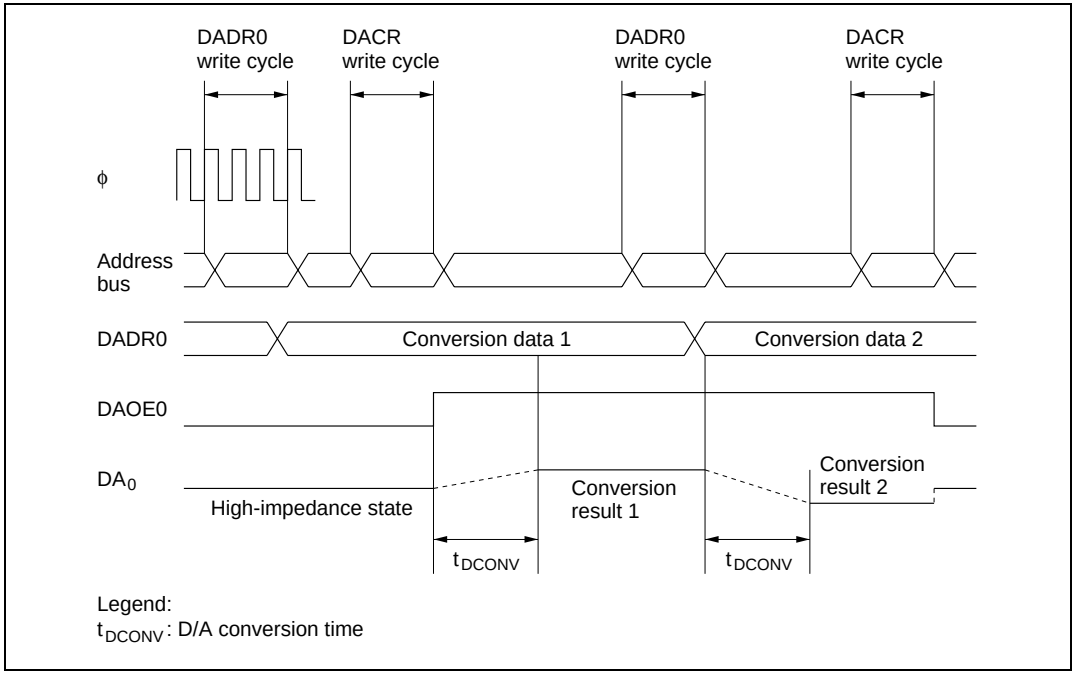


Figure 16.2 Example of D/A Converter Operation

16.4 D/A Output Control

In the H8/3052BF, D/A converter output can be enabled or disabled in software standby mode.

When the DASTE bit is set to 1 in DASTCR, D/A converter output is enabled in software standby mode. The D/A converter registers retain the values they held prior to the transition to software standby mode.

When D/A output is enabled in software standby mode, the reference supply current is the same as during normal operation.

Section 17 RAM

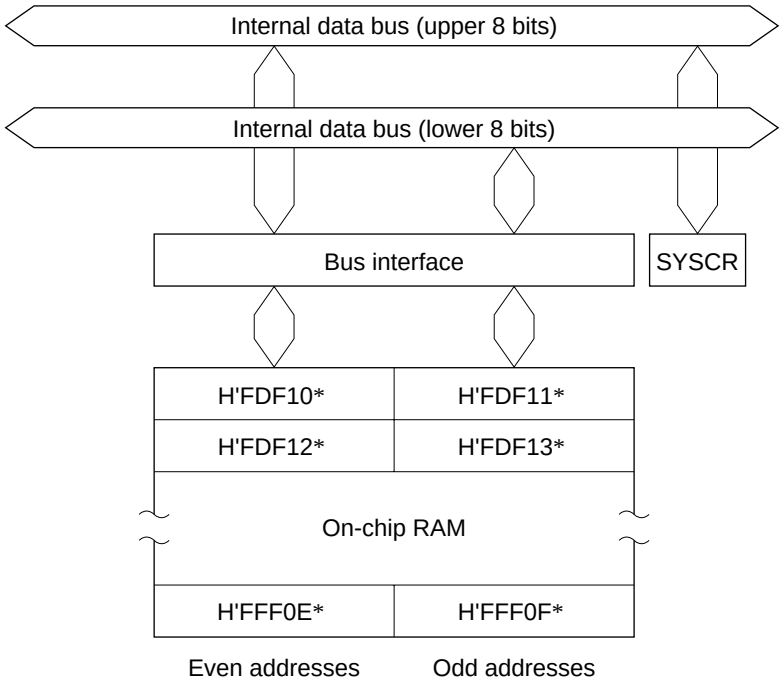
17.1 Overview

The H8/3052BF has 8 kbytes of high-speed static RAM on-chip. The RAM is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, making the RAM useful for rapid data transfer.

The on-chip RAM of the H8/3052BF is assigned to addresses H'FDF10 to H'FFF0F in modes 1, 2, 5, and 7, and to addresses H'FFDF10 to H'FFFF0F in modes 3, 4, and 6. The RAM enable bit (RAME) in the system control register (SYSCR) can enable or disable the on-chip RAM.

17.1.1 Block Diagram

Figure 17.1 shows a block diagram of the on-chip RAM.



Legend:
SYSCR: System control register

Note: * This example is of the H8/3052BF operating in mode 7. The lower 20 bits of the address are shown.

Figure 17.1 RAM Block Diagram

17.1.2 Register Configuration

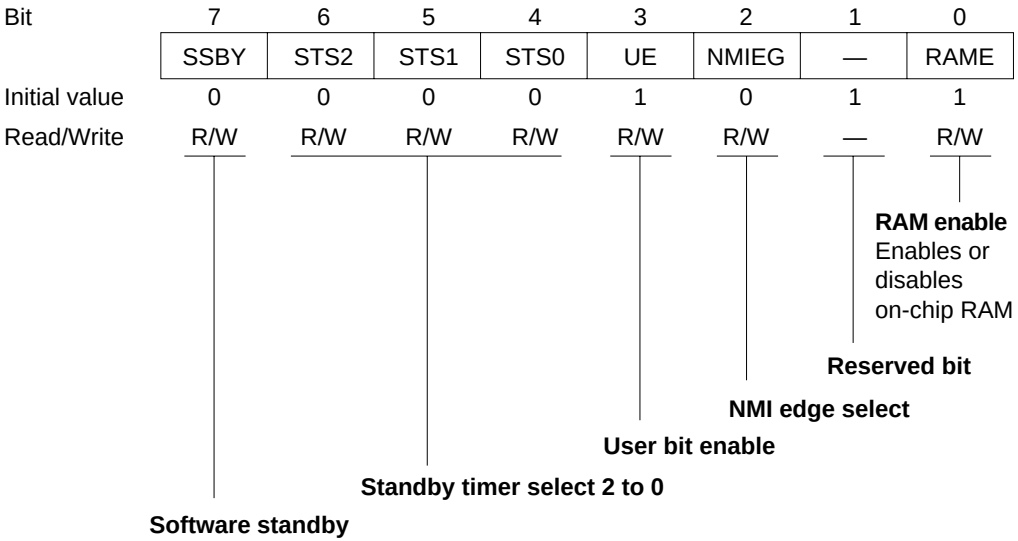
The on-chip RAM is controlled by SYSCR. Table 17.1 gives the address and initial value of SYSCR.

Table 17.1 System Control Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B

Note: * Lower 16 bits of the address.

17.2 System Control Register (SYSCR)



One function of SYSCR is to enable or disable access to the on-chip RAM. The on-chip RAM is enabled or disabled by the RAME bit in SYSCR. For details about the other bits, see section 3.3, System Control Register (SYSCR).

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized at the rising edge of the input at the $\overline{\text{RES}}$ pin. It is not initialized in software standby mode.

Bit 0: RAME	Description	
0	On-chip RAM is disabled	
1	On-chip RAM is enabled	(Initial value)

17.3 Operation

When the RAME bit is set to 1, the on-chip RAM is enabled. Accesses to addresses H'FDF10 to H'FFF0F in the H8/3052BF in modes 1, 2, 5, and 7, addresses H'FFDF10 to H'FFFF0F in the H8/3052BF in modes 3, 4, and 6 are directed to the on-chip RAM. In modes 1 to 6 (expanded modes), when the RAME bit is cleared to 0, the external address space is accessed. In mode 7 (single-chip mode), when the RAME bit is cleared to 0, the on-chip RAM is not accessed: read access always results in H'FF data, and write access is ignored.

Since the on-chip RAM is connected to the CPU by an internal 16-bit data bus, it can be written and read by word access. It can also be written and read by byte access. Byte data is accessed in two states using the upper 8 bits of the data bus. Word data starting at an even address is accessed in two states using all 16 bits of the data bus.

Section 18 ROM

18.1 Features

The H8/3052BF has 512 kbytes of on-chip flash memory. The features of the flash memory are summarized below.

- Four flash memory operating modes
  - Program mode
  - Erase mode
  - Program-verify mode
  - Erase-verify mode
- Programming/erase methods

  The flash memory is programmed 128 bytes at a time. Block erase (in single-block units) can be performed. To erase the entire flash memory, each block must be erased in turn. Block erasing can be performed as required on 4 kbytes, 32 kbytes, and 64 kbytes blocks.
- Programming/erase times

  The flash memory programming time is 10 ms (typ.) for simultaneous 128-byte programming, equivalent approximately to 80 µs (typ.) per byte, and the erase time is 100 ms (typ.).
- Reprogramming capability

  The flash memory can be reprogrammed up to 100 times.
- On-board programming modes

  There are two modes in which flash memory can be programmed/erased/verified on-board:
  - Boot mode
  - User program mode
- Automatic bit rate adjustment

  With data transfer in boot mode, the LSI's bit rate can be automatically adjusted to match the transfer bit rate of the host.
- Flash memory emulation in RAM

  Flash memory programming can be emulated in real time by overlapping a part of RAM onto flash memory.
- Protect modes

  There are two protect modes, hardware and software, which allow protected status to be designated for flash memory program/erase/verify operations.

- PROM mode

  Flash memory can be programmed/erased in PROM mode, using a PROM programmer, as well as in on-board programming mode.

18.2 Overview

18.2.1 Block Diagram

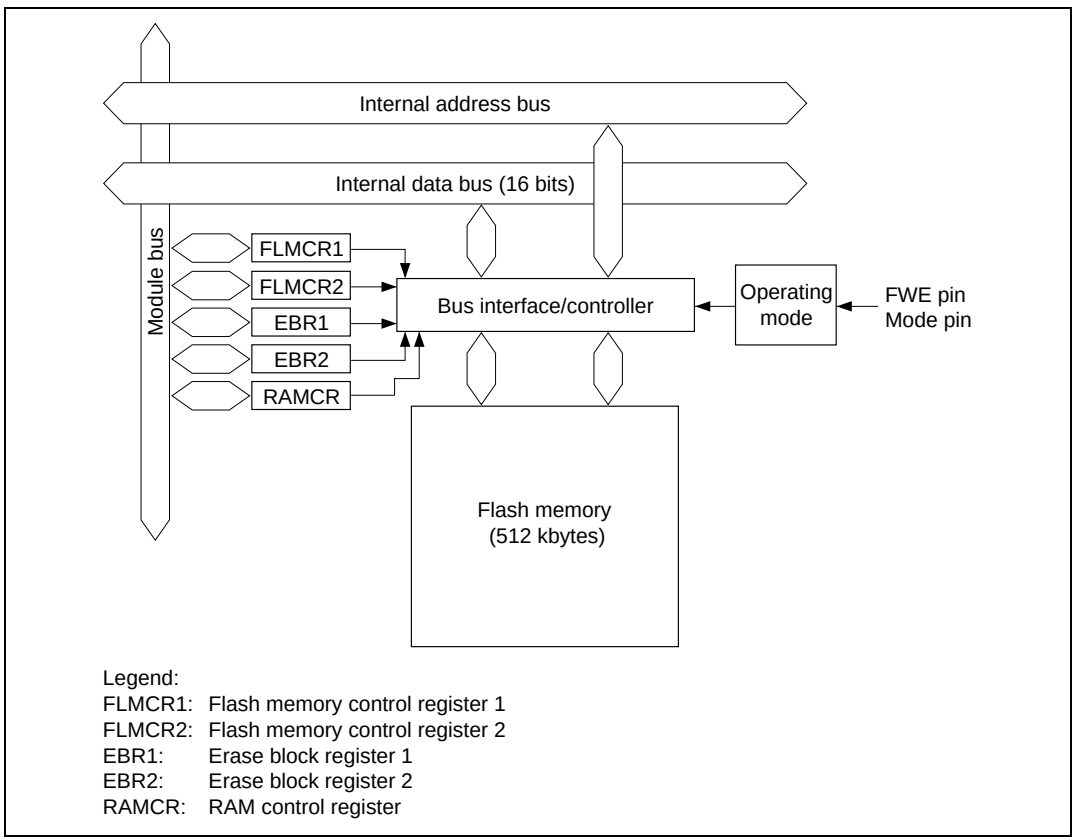


Figure 18.1 Block Diagram of Flash Memory

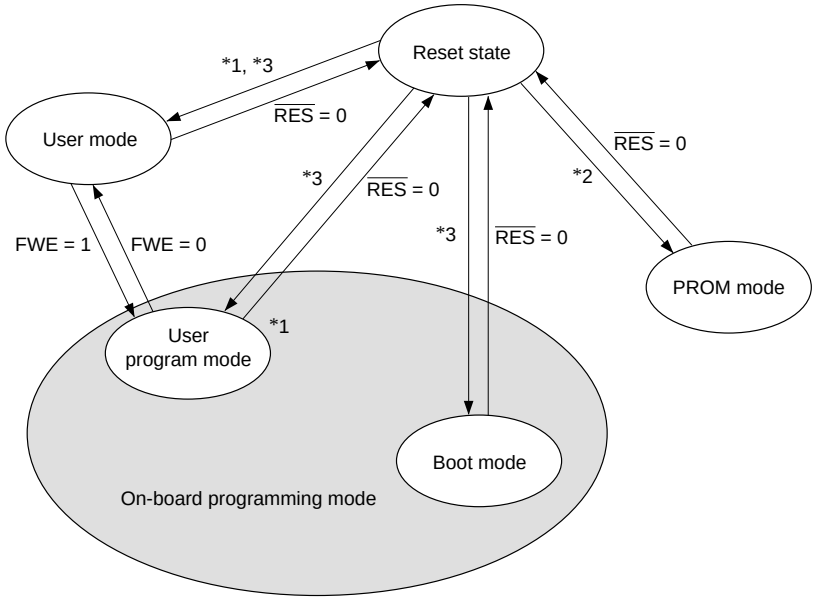
18.2.2 Mode Transitions

When the mode pins and the FWE pin are set in the reset state and a reset-start is executed, the microcomputer enters an operating mode as shown in figure 18.2. In user mode, flash memory can be read but not programmed or erased.

The boot, user program and PROM modes are provided as modes to write and erase the flash memory.



Notes: Only make a transition between user mode and user program mode when the CPU is not accessing the flash memory.

1. RAM emulation possible
2. The H8/3052F is placed in PROM mode by means of a dedicated PROM writer.
3. Mode settings are shown in the following table.

Mode	Pins			
	FWE	MD_2	MD_1	MD_0
Mode 1	0	0	0	1
Mode 2		0	1	0
Mode 3		0	1	1
Mode 4		1	0	0
Mode 5		1	0	1
Mode 6		1	1	0
Mode 7		1	1	1
Boot mode 5	1	0	0	1
Boot mode 6		0	1	0
Boot mode 7		0	1	1
Setting prohibited		1	0	0
User program mode 5		1	0	1
User program mode 6		1	1	0
User program mode 7		1	1	1

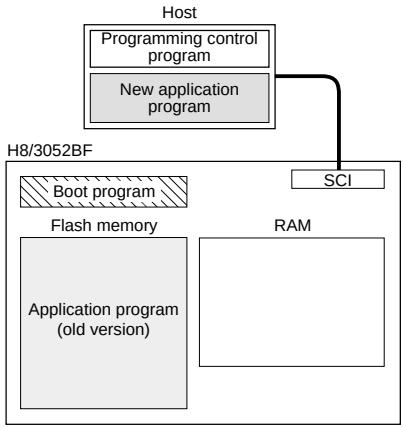
Figure 18.2 Flash Memory State Transitions

State transitions between the normal user mode and on-board programming mode are performed by changing the FWE pin level from high to low or from low to high. To prevent misoperation (erroneous programming or erasing) in these cases, the bits in the flash memory control registers (FLMCR1, FLMCR2) should be cleared to 0 before making such a transition. After the bits are cleared, a wait time is necessary. Normal operation is not guaranteed if this wait time is insufficient.

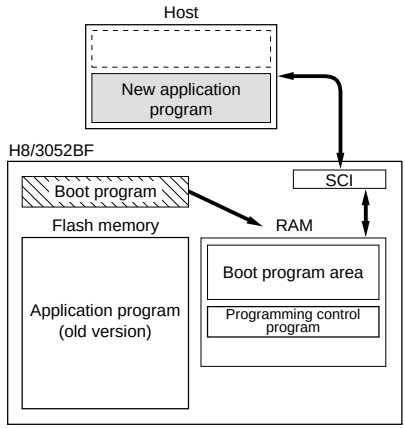
18.2.3 On-Board Programming Modes

Boot Mode

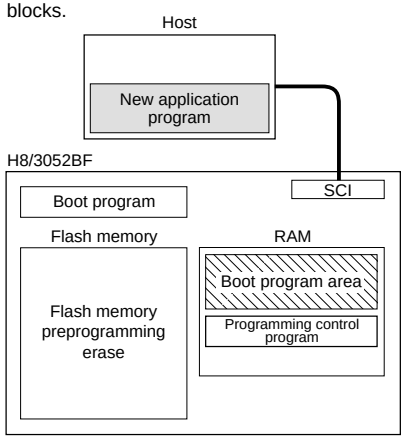
1. Initial state
   The old program version or data remains written in the flash memory. The user should prepare the programming control program and new application program beforehand in the host.



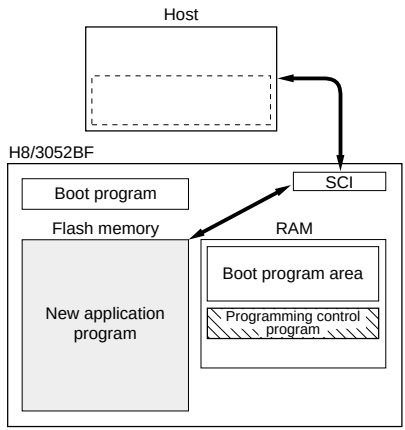
2. Programming control program transfer
   When boot mode is entered, the boot program in the H8/3052F (originally incorporated in the chip) is started and the programming control program in the host is transferred to RAM via SCI communication. The boot program required for flash memory erasing is automatically transferred to the RAM boot program area.



3. Flash memory initialization
   The erase program in the boot program area (in RAM) is executed, and the flash memory is initialized (to H'FF). In boot mode, total flash memory erasure is performed, without regard to blocks.



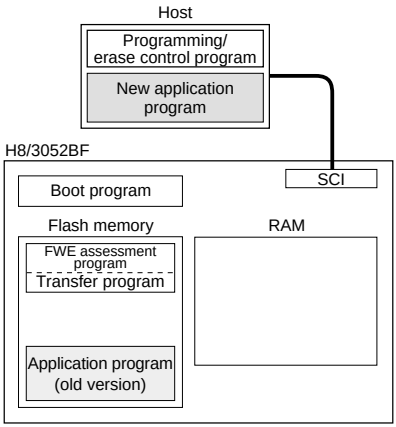
4. Writing new application program
   The programming control program transferred from the host to RAM is executed, and the new application program in the host is written into the flash memory.



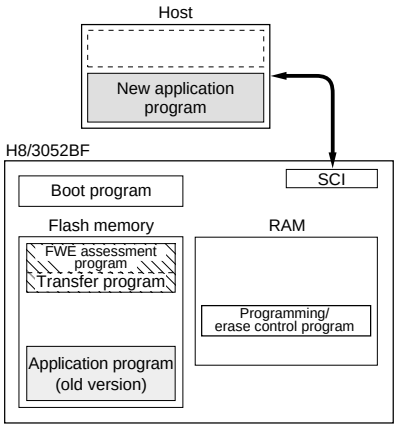
Program execution state

User Program Mode

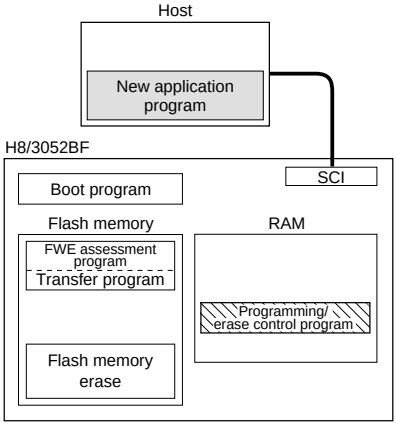
1. Initial state
   The FWE assessment program that confirms that user program mode has been entered, and the program that will transfer the programming/erase control program from flash memory to on-chip RAM should be written into the flash memory by the user beforehand. The programming/erase control program should be prepared in the host or in the flash memory.



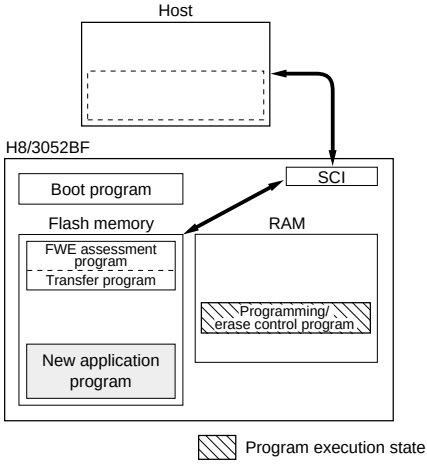
2. Programming/erase control program transfer
   When user program mode is entered, user software confirms this fact, executes transfer program in the flash memory, and transfers the programming/erase control program to RAM.



3. Flash memory initialization
   The programming/erase program in RAM is executed, and the flash memory is initialized (to H'FF). Erasing can be performed in block units, but not in byte units.



4. Writing new application program
   Next, the new application program in the host is written into the erased flash memory blocks. Do not write to unerased blocks.



18.2.4 Flash Memory Emulation in RAM

In the H8/3052BF, flash memory programming can be emulated in real time by overlapping the flash memory with part of RAM ("overlap RAM"). When the emulation block set in RAMCR is accessed while the emulation function is being executed, data written in the overlap RAM is read. Emulation should be performed in user mode or user program mode.

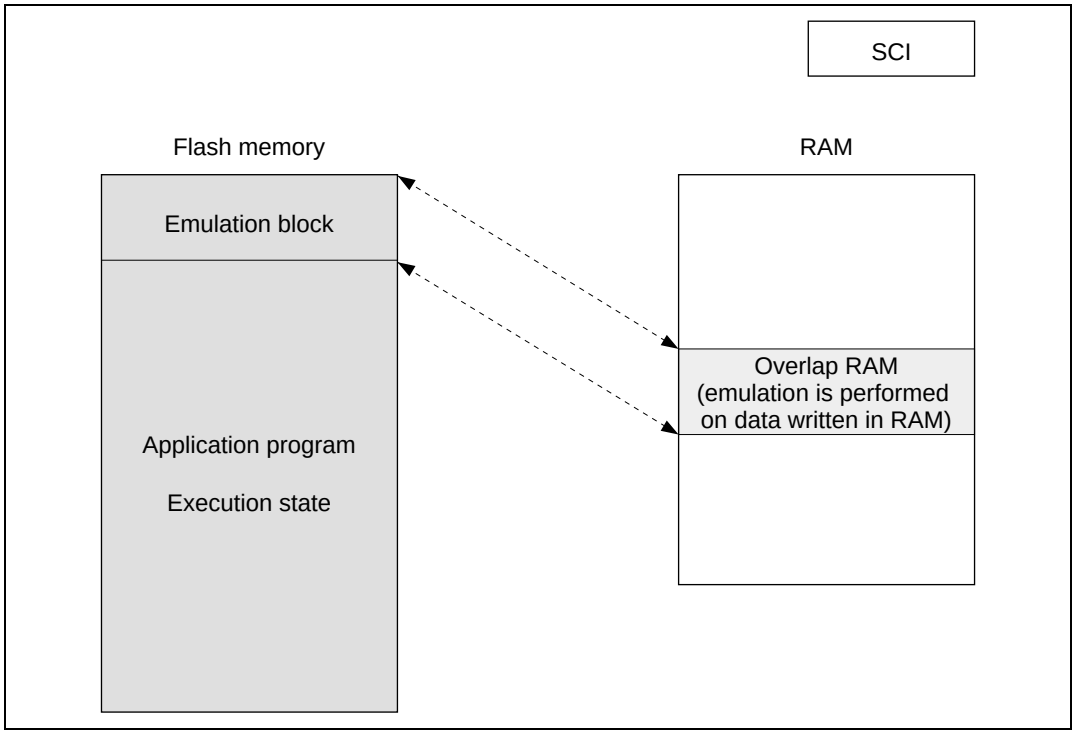


Figure 18.3 Reading Overlap RAM Data in User Mode or User Program Mode

When overlap RAM data is confirmed, clear the RAMS bit to release RAM overlap, and actually perform writes to the flash memory.

When the programming control program is transferred to RAM in on-board programming mode, ensure that the transfer destination and the overlap RAM do not overlap, as this will cause data in the overlap RAM to be rewritten.

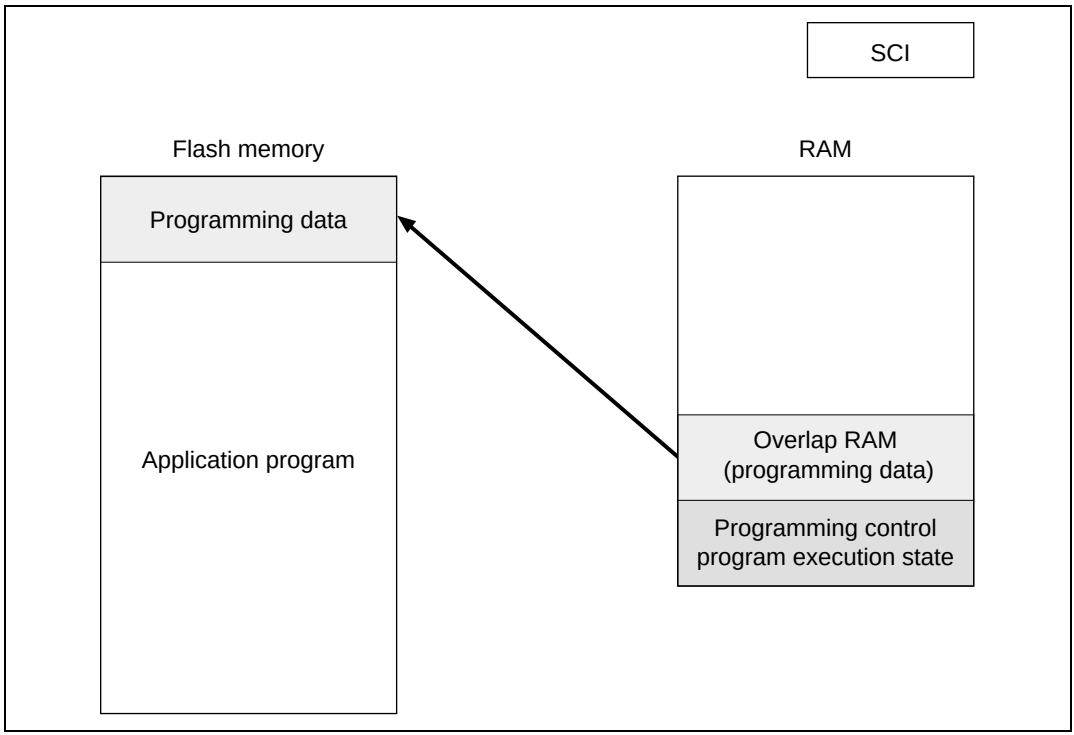

Figure 18.4 Writing Overlap RAM Data in User Program Mode

18.2.5 Differences between Boot Mode and User Program Mode

Item	Boot Mode	User Program Mode
Total erase	Yes	Yes
Block erase	No	Yes
Programming control program*	Boot program is initiated, and programming control program is transferred from host to on-chip RAM, and executed there.	Program that controls programming program in flash memory is executed. Program should be written beforehand in PROM mode and boot mode.

Note: * To be provided by the user, in accordance with the recommended algorithm.

18.2.6 Block Configuration

The flash memory in the H8/3052BF is divided into seven 64-kbyte blocks, one 32-kbyte block, and eight 4-kbyte blocks.

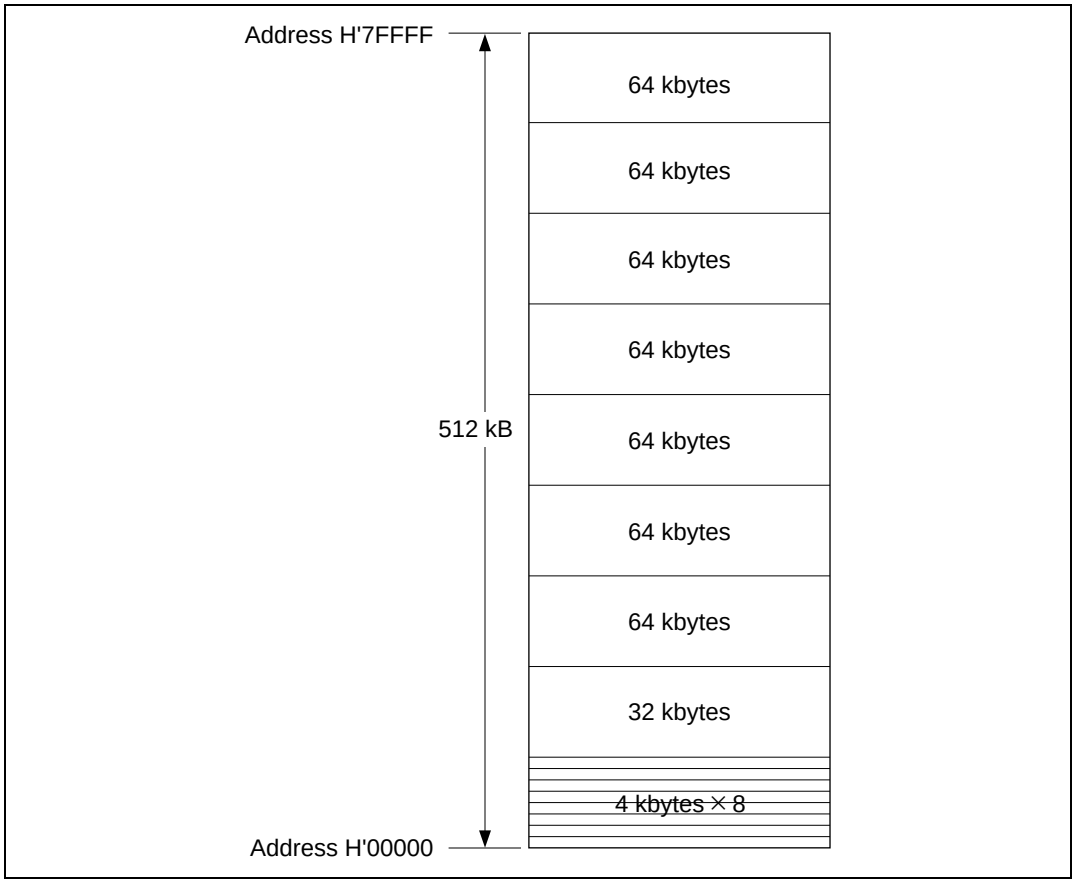

Figure 18.5 Erase Area Block Divisions

18.3 Pin Configuration

The flash memory is controlled by means of the pins shown in table 18.1.

Table 18.1 Pin Configuration

Pin Name	Abbreviation	I/O	Function
Reset	$\overline{\text{RES}}$	Input	Reset
Flash write enable	FWE	Input	Flash program/erase protection by hardware
Mode 2	MD2	Input	Sets LSI operating mode
Mode 1	MD1	Input	Sets LSI operating mode
Mode 0	MD0	Input	Sets LSI operating mode
Transmit data	TxD1	Output	Serial transmit data output
Receive data	RxD1	Input	Serial receive data input

18.4 Register Configuration

The registers*1 used to control the on-chip flash memory when enabled are shown in table 18.2.

Table 18.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address*2
Flash memory control register 1	FLMCR1*6	R/W*3	H'00*4	H'FF40
Flash memory control register 2	FLMCR2*6	R/W*3	H'00	H'FF41
Erase block register 1	EBR1*6	R/W*3	H'00*5	H'FF42
Erase block register 2	EBR2*6	R/W*3	H'00*5	H'FF43
RAM control register	RAMCR*6	R/W	H'F0	H'FF47

Notes: 1. Access is prohibited to lower 16 address bits H'FF44 to H'FF46 and H'FF48 to H'FF4F.
2. Lower 16 bits of the address.
3. If the chip is in a mode in which the on-chip flash memory is disabled, a read will return H'00 and writes are invalid. Writes are also invalid when the FWE bit in FLMCR1 is not set to 1.
4. When a high level is input to the FWE pin, the initial value is H'80.
5. When a low level is input to the FWE pin, or if a high level is input and the SWE1 bit in FLMCR1 or SWE2 bit in FLMCR2 is not set, these registers are initialized to H'00.
6. FLMCR1, FLMCR2, EBR1, and EBR2, and RAMCR are 8-bit registers.
Byte access must be used on these registers (do not use word or longword access).

18.5 Register Descriptions

18.5.1 Flash Memory Control Register 1 (FLMCR1)

FLMCR1 is an 8-bit register used for flash memory operating mode control. Program-verify mode or erase-verify mode for addresses H'00000 to H'3FFFF is entered by setting SWE1 bit to 1 when FWE = 1, then setting the PV1 or EV1 bit. Program mode for addresses H'00000 to H'3FFFF is entered by setting SWE1 bit to 1 when FWE = 1, then setting the PSU1 bit, and finally setting the P1 bit. Erase mode for addresses H'00000 to H'3FFFF is entered by setting SWE1 bit to 1 when FWE = 1, then setting the ESU1 bit, and finally setting the E1 bit. FLMCR1 is initialized by a power-on reset, and in hardware standby mode and software standby mode. Its initial value is H'80 when a high level is input to the FWE pin, and H'00 when a low level is input. When on-chip flash memory is disabled, a read will return H'00, and writes are invalid.

Writes are enabled only in the following cases: Writes to bit SWE1 of FLMCR1 enabled when FWE = 1, to bits ESU1, PSU1, EV1, and PV1 when FWE = 1 and SWE1 = 1, to bit E1 when FWE = 1, SWE1 = 1 and ESU1 = 1, and to bit P1 when FWE = 1, SWE1 = 1, and PSU1 = 1.

Bit	7	6	5	4	3	2	1	0
	FWE	SWE1	ESU1	PSU1	EV1	PV1	E1	P1
Initial value	1/0	0	0	0	0	0	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 7—Flash Write Enable Bit (FWE): Sets hardware protection against flash memory programming/erasing.

Bit 7: FWE	Description
0	When a low level is input to the FWE pin (hardware-protected state)
1	When a high level is input to the FWE pin

Bit 6—Software Write Enable Bit 1 (SWE1): Enables or disables flash memory programming and erasing (applicable addresses: H'00000 to H'3FFFF). Set this bit when setting bits 5 to 0, bits 7 to 0 of EBR1, and bits 3 to 0 of EBR2.

Bit 6: SWE1	Description	
0	Writes disabled	(Initial value)
1	Writes enabled*	
	[Setting condition]	
	When FWE = 1	

Note: * Do not execute a SLEEP instruction while the SWE1 bit is set to 1.

Bit 5—Erase Setup Bit 1 (ESU1): Prepares for a transition to erase mode (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, PSU1, EV1, PV1, E1, or P1 bit at the same time. Set this bit to 1 before setting bit E1 to 1 in FLMCR1.

Bit 5: ESU1	Description	
0	Erase setup cleared	(Initial value)
1	Erase setup [Setting condition] When FWE = 1 and SWE1 = 1	

Bit 4—Program Setup Bit 1 (PSU1): Prepares for a transition to program mode (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, ESU1, EV1, PV1, E1, or P1 bit at the same time. Set this bit to 1 before setting bit P1 to 1 in FLMCR1.

Bit 4: PSU1	Description	
0	Program setup cleared	(Initial value)
1	Program setup [Setting condition] When FWE = 1 and SWE1 = 1	

Bit 3—Erase-Verify 1 (EV1): Selects erase-verify mode transition or clearing (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, ESU1, PSU1, PV1, E1, or P1 bit at the same time.

Bit 3: EV1	Description	
0	Erase-verify mode cleared	(Initial value)
1	Transition to erase-verify mode [Setting condition] When FWE = 1 and SWE1 = 1	

Bit 2—Program-Verify 1 (PV1): Selects program-verify mode transition or clearing (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, ESU1, PSU1, EV1, E1, or P1 bit at the same time.

Bit 2: PV1	Description	
0	Program-verify mode cleared	(Initial value)
1	Transition to program-verify mode [Setting condition] When FWE = 1 and SWE1 = 1	

Bit 1—Erase 1 (E1): Selects erase mode transition or clearing (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, ESU1, PSU1, EV1, PV1, or P1 bit at the same time.

Bit 1: E1	Description	
0	Erase mode cleared	(Initial value)
1	Transition to erase mode* [Setting condition] When FWE = 1, SWE1 = 1, and ESU1 = 1	

Note: * Do not access flash memory while the E1 bit is set to 1.

Bit 0—Program (P1): Selects program mode transition or clearing (applicable addresses: H'00000 to H'3FFFF). Do not set the SWE1, PSU1, ESU1, EV1, PV1, or E1 bit at the same time.

Bit 0: P1	Description	
0	Program mode cleared	(Initial value)
1	Transition to program mode* [Setting condition] When FWE = 1, SWE1 = 1, and PSU1 = 1	

Note: * Do not access flash memory while the P1 bit is set.

18.5.2 Flash Memory Control Register 2 (FLMCR2)

FLMCR2 is an 8-bit register used for flash memory operating mode control. Program-verify mode or erase-verify mode for addresses H'40000 to H'7FFFF is entered by setting SWE2 to 1 when FWE (FLMCR1) = 1, then setting the EV2 or PV2 bit. Program mode for addresses H'40000 to H'7FFFF is entered by setting SWE2 to 1 when FWE (FLMCR1) = 1, then setting the PSU2 bit, and finally setting the P2 bit. Erase mode for addresses H'40000 to H'7FFFF is entered by setting SWE2 to 1 when FWE (FLMCR1) = 1, then setting the ESU2 bit, and finally setting the E2 bit. FLMCR2 is initialized to H'00 by a power-on reset, in hardware standby mode and software standby mode, when a low level is input to the FWE pin, and when a high level is input to the FWE pin and the SWE2 bit in FLMCR2 is not set (the exception is the FLER bit, which is initialized only by a power-on reset and in hardware standby mode). When on-chip flash memory is disabled, a read will return H'00, and writes are invalid.

Writes are enabled only in the following cases: Writes to bit SWE2 of FLMCR2 enabled when FWE (FLMCR1) = 1, to bits ESU2, PSU2, EV2, and PV2 when FEW (FLMCR1) = 1 and SWE2 = 1, to bit E2 when FWE (FLMCR1) = 1, SWE2 = 1, and ESU2 = 1, to bit P2 when FWE (FLMCR1) = 1, SWE2 = 1, and PSU2 = 1.

Bit	7	6	5	4	3	2	1	0
	FLER	SWE2	ESU2	PSU2	EV2	PV2	E2	P2
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 7—Flash Memory Error (FLER): Indicates that an error has occurred during an operation on flash memory (programming or erasing). When FLER is set to 1, flash memory goes to the error-protection state.

Bit 7: FLER	Description
0	Flash memory is operating normally (Initial value) Flash memory program/erase protection (error protection) is disabled [Clearing condition] Power-on reset or hardware standby mode
1	An error has occurred during flash memory programming/erasing Flash memory program/erase protection (error protection) is enabled [Setting condition] See 18.8.3 Error Protection

Bit 6—Software Write Enable Bit 2 (SWE2): Enables or disables flash memory programming and erasing (applicable addresses: H'40000 to H'7FFFF). Set this bit when setting bits 5 to 0 and bits 7 to 4 of EBR2.

Bit 6: SWE2	Description	
0	Writes disabled	(Initial value)
1	Writes enabled*	
	[Setting condition]	
	When FWE = 1	

Note: * Do not execute a SLEEP instruction while the SWE2 bit is set to 1.

Bit 5—Erase Setup Bit 2 (ESU2): Prepares for a transition to erase mode (applicable addresses: H'40000 to H'7FFFF). Set this bit to 1 before setting bit E2 to 1 in FLMCR2. Do not set the PSU2, EV2, PV2, E2, or P2 bit at the same time.

Bit 5: ESU2	Description	
0	Erase setup cleared	(Initial value)
1	Erase setup	
	[Setting condition]	
	When FWE = 1 and SWE2 = 1	

Bit 4—Program Setup Bit 2 (PSU2): Prepares for a transition to program mode (applicable addresses: H'40000 to H'7FFFF). Set this bit to 1 before setting bit P2 to 1 in FLMCR2. Do not set the ESU2, EV2, PV2, E2, or P2 bit at the same time.

Bit 4: PSU2	Description	
0	Program setup cleared	(Initial value)
1	Program setup	
	[Setting condition]	
	When FWE = 1 and SWE2 = 1	

Bit 3—Erase-Verify 2 (EV2): Selects erase-verify mode transition or clearing (applicable addresses: H'40000 to H'7FFFF). Do not set the ESU2, PSU2, PV2, E2, or P2 bit at the same time.

Bit 3: EV2	Description	
0	Erase-verify mode cleared	(Initial value)
1	Transition to erase-verify mode [Setting condition] When FWE = 1 and SWE2 = 1	

Bit 2—Program-Verify 2 (PV2): Selects program-verify mode transition or clearing (applicable addresses: H'40000 to H'7FFFF). Do not set the ESU2, PSU2, EV2, E2, or P2 bit at the same time.

Bit 2: PV2	Description	
0	Program-verify mode cleared	(Initial value)
1	Transition to program-verify mode [Setting condition] When FWE = 1 and SWE2 = 1	

Bit 1—Erase 2 (E2): Selects erase mode transition or clearing (applicable addresses: H'40000 to H'7FFFF). Do not set the ESU2, PSU2, EV2, PV2, or P2 bit at the same time.

Bit 1: E2	Description	
0	Erase mode cleared	(Initial value)
1	Transition to erase mode* [Setting condition] When FWE = 1, SWE2 = 1, and ESU2 = 1	

Note: * Do not access flash memory while the E2 bit is set to 1.

Bit 0—Program 2 (P2): Selects program mode transition or clearing (applicable addresses: H'40000 to H'7FFFF). Do not set the ESU2, PSU2, EV2, PV2, or E2 bit at the same time.

Bit 0: P2	Description	
0	Program mode cleared	(Initial value)
1	Transition to program mode* [Setting condition] When FWE = 1, SWE2 = 1, and PSU2 = 1	

Note: * Do not access flash memory while the P2 bit is set.

18.5.3 Erase Block Register 1 (EBR1)

EBR1 is an 8-bit register that specifies the flash memory erase area block by block. EBR1 is initialized to H'00 by a power-on reset, in hardware standby mode and software standby mode, when a low level is input to the FWE pin, and when a high level is input to the FWE pin and the SWE1 bit in FLMCR1 is not set. When a bit in EBR1 is set to 1, the corresponding block can be erased. Other blocks are erase-protected. Only one of the bits of EBR1 and EBR2 combined can be set. Do not set more than one bit, as this will cause all the bits in both EBR1 and EBR2 to be automatically cleared to 0. When on-chip flash memory is disabled, a read will return H'00, and writes are invalid.

The flash memory block configuration is shown in table 18.3.

Bit	7	6	5	4	3	2	1	0
	EB7	EB6	EB5	EB4	EB3	EB2	EB1	EB0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

18.5.4 Erase Block Register 2 (EBR2)

EBR2 is an 8-bit register that specifies the flash memory erase area block by block. EBR2 is initialized to H'00 by a power-on reset, in hardware standby mode and software standby mode, when a low level is input to the FWE pin. Bits EB11 to EB8 will be initialized to 0 if bit SWE1 of FLMCR1 is not set, even though a high level is input to pin FWE. Also, bits EB15 to EB12 will be initialized to 0 if bit SWE2 of FLMCR2 is not set. When a bit in EBR2 is set to 1, the corresponding block can be erased. Other blocks are erase-protected. Only one of the bits of EBR1 and EBR2 combined can be set. Do not set more than one bit, as this will cause all the bits in both EBR1 and EBR2 to be automatically cleared to 0. When on-chip flash memory is disabled, a read will return H'00, and writes are invalid.

The flash memory block configuration is shown in table 18.3.

Bit	7	6	5	4	3	2	1	0
	EB15	EB14	EB13	EB12	EB11	EB10	EB9	EB8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.3 Flash Memory Erase Blocks

Block (Size)	Addresses
EB0 (4 kbytes)	H'000000–H'000FFF
EB1 (4 kbytes)	H'001000–H'001FFF
EB2 (4 kbytes)	H'002000–H'002FFF
EB3 (4 kbytes)	H'003000–H'003FFF
EB4 (4 kbytes)	H'004000–H'004FFF
EB5 (4 kbytes)	H'005000–H'005FFF
EB6 (4 kbytes)	H'006000–H'006FFF
EB7 (4 kbytes)	H'007000–H'007FFF
EB8 (32 kbytes)	H'008000–H'00FFFF
EB9 (64 kbytes)	H'010000–H'01FFFF
EB10 (64 kbytes)	H'020000–H'02FFFF
EB11 (64 kbytes)	H'030000–H'03FFFF
EB12 (64 kbytes)	H'040000–H'04FFFF
EB13 (64 kbytes)	H'050000–H'05FFFF
EB14 (64 kbytes)	H'060000–H'06FFFF
EB15 (64 kbytes)	H'070000–H'07FFFF

18.5.5 RAM Control Register (RAMCR)

RAMCR specifies the area of flash memory to be overlapped with part of RAM when emulating real-time flash memory programming. RAMCR initialized to H'F0 by a power-on reset and in hardware standby mode. It is not initialized by a manual reset and in software standby mode. RAMCR settings should be made in user mode or user program mode.

Flash memory area divisions are shown in table 18.4. To ensure correct operation of the emulation function, the ROM for which RAM emulation is performed should not be accessed immediately after this register has been modified. Normal execution of an access immediately after register modification is not guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RAMS	RAM2	RAM1	RAM0
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Bits 7 to 4—Reserved: These bits always read 1.

Bit 3—RAM Select (RAMS): Specifies selection or non-selection of flash memory emulation in RAM. When RAMS = 1, all flash memory block are program/erase-protected.

Bit 3: RAMS	Description	
0	Emulation not selected	(Initial value)
	Program/erase-protection of all flash memory blocks is disabled	
1	Emulation selected	
	Program/erase-protection of all flash memory blocks is enabled	

Bits 2 to 0—Flash Memory Area Selection: These bits are used together with bit 3 to select the flash memory area to be overlapped with RAM. (See table 18.4.)

Table 18.4 Flash Memory Area Divisions

Addresses	Block Name	RAMS	RAM1	RAM1	RAM0
H'FFE000–H'FFEFFF	RAM area 4 kbytes	0	*	*	*
H'000000–H'000FFF	EB0 (4 kbytes)	1	0	0	0
H'001000–H'001FFF	EB1 (4 kbytes)	1	0	0	1
H'002000–H'002FFF	EB2 (4 kbytes)	1	0	1	0
H'003000–H'003FFF	EB3 (4 kbytes)	1	0	1	1
H'004000–H'004FFF	EB4 (4 kbytes)	1	1	0	0
H'005000–H'005FFF	EB5 (4 kbytes)	1	1	0	1
H'006000–H'006FFF	EB6 (4 kbytes)	1	1	1	0
H'007000–H'007FFF	EB7 (4 kbytes)	1	1	1	1

*: Don't care

18.6 On-Board Programming Modes

When pins are set to on-board programming mode and a reset-start is executed, a transition is made to the on-board programming state in which program/erase/verify operations can be performed on the on-chip flash memory. There are two on-board programming modes: boot mode and user program mode. The pin settings for transition to each of these modes are shown in table 18.5. For a diagram of the transitions to the various flash memory modes, see figure 18.2.

Table 18.5 Setting On-Board Programming Modes

Mode		FWE	MD2	MD1	MD0	Notes
Boot mode	Mode 5	1*	0*	0	1	0: V_{IL}
	Mode 6		0*	1	0	1: V_{IH}
	Mode 7		0*	1	1	
User program mode	Mode 5		1*	0	1	
	Mode 6		1*	1	0	
	Mode 7		1*	1	1	

Notes: 1. For the high-level application timing, see items 6 and 7 in Notes on Use of Boot Mode.
2. In boot mode, the inverse of the MD_2 setting should be input.
3. In boot mode, the mode control register (MDCR) can be used to monitor the status of modes 5, 6, and 7, in the same way as in normal mode.

18.6.1 Boot Mode

When boot mode is used, the flash memory programming control program must be prepared in the host beforehand. The SCI channel to be used is set to asynchronous mode.

When a reset-start is executed after the LSI's pins have been set to boot mode, the boot program built into the LSI is started and the programming control program prepared in the host is serially transmitted to the LSI via the SCI. In the LSI, the programming control program received via the SCI is written into the programming control program area in on-chip RAM. After the transfer is completed, control branches to the start address of the programming control program area and the programming control program execution state is entered (flash memory programming is performed).

The transferred programming control program must therefore include coding that follows the programming algorithm given later.

The system configuration in boot mode is shown in figure 18.6, and the boot mode execution procedure in figure 18.7.

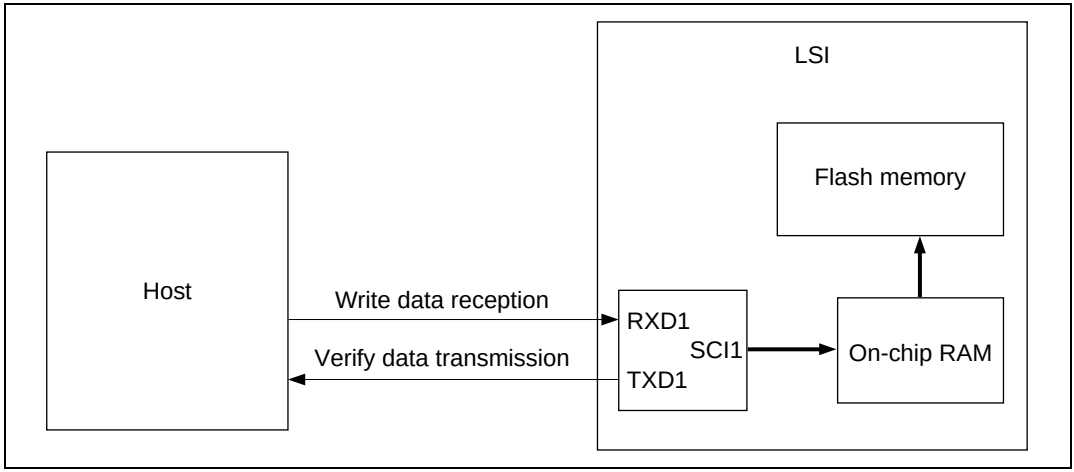

Figure 18.6 System Configuration in Boot Mode

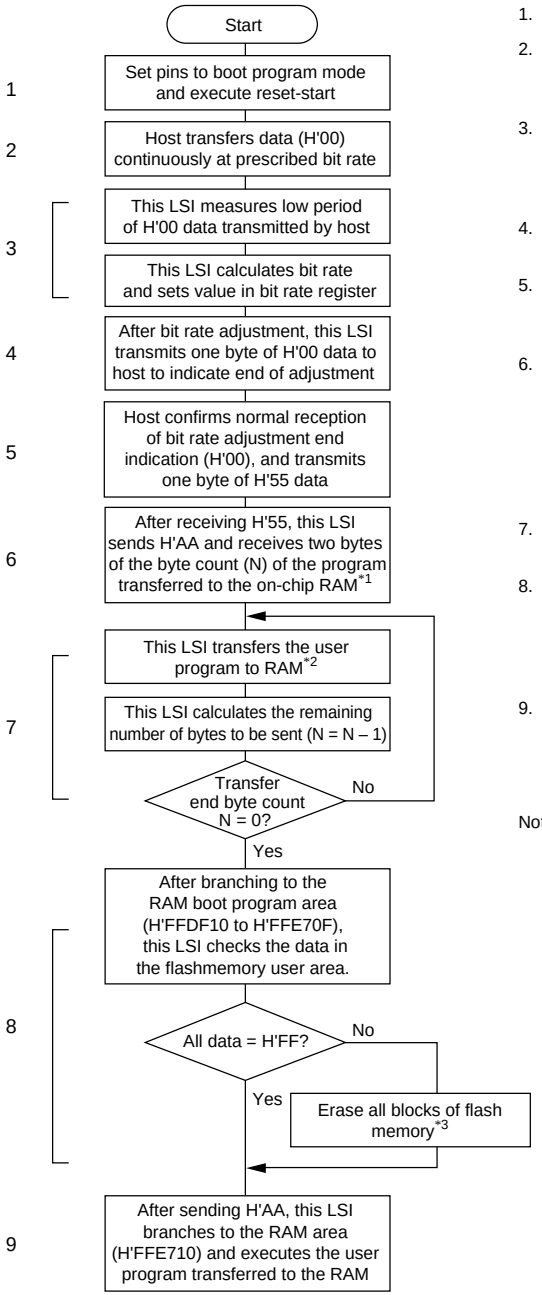
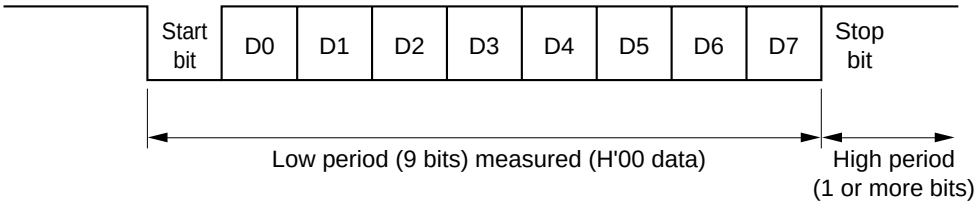


1. Set this LSI to the boot mode and reset starts the LSI.
2. Set the host to the prescribed bit rate (4800, 9600, 19200) and consecutively send H'00 data in 8-bit data, 1 stop bit format.
3. This LSI repeatedly measures the RXD1 pin Low period and calculates the asynchronous communication bit rate at which the host performs transfer.
4. At the end of SCI bit rate adjustment, this LSI sends one byte of H'00 data to signal the end of adjustment.
5. Check if the host normally received the one byte bit rate adjustment end signal sent from this LSI and sent one byte of H'55 data.
6. After H'55 is sent, the host receives H'AA and sends the byte count of the user program that is transferred to this LSI. Send the 2-byte count in upper byte and lower byte order. Then sequentially send the program set by the user. This LSI sequentially sends (echo back) each byte of the received byte count and user program to the host as verification data.
7. This LSI sequentially writes the received user program to the on-chip RAM area (H'FFE710 to H'FFFF0F).
8. Before executing the transferred user program, this LSI checks if data was written to flash memory after control branched to the RAM boot program area (H'FFDF10). If data was already written to flash memory, all the blocks are erased.
9. After sending H'AA, this LSI branches to the on-chip RAM area (H'FFE710) and executes the user program written to that area.

Notes:
1. The RAM area that can be used by the user is 6 kbyte. Set the transfer byte count to within 6 kbyte. Always send the 2-byte transfer byte count in upper byte and lower byte order. Transfer byte count example: For 256 bytes (H'0100), upper byte H'01, lower byte H'00.
2. Set the part that controls the user program flash memory at the program according to the flash memory programming/erase algorithms described later.
3. When a memory cell malfunctions and cannot be erased, this LSI sends one H'FF byte as an erase error and stops the erase operation and subsequent operations.

Figure 18.7 Boot Mode Execution Procedure

Automatic SCI Bit Rate Adjustment



When boot mode is initiated, the LSI measures the low period of the asynchronous SCI communication data (H'00) transmitted continuously from the host. The SCI transmit/receive format should be set as follows: 8-bit data, 1 stop bit, no parity. The LSI calculates the bit rate of the transmission from the host from the measured low period, and transmits one H'00 byte to the host to indicate the end of bit rate adjustment. The host should confirm that this adjustment end indication (H'00) has been received normally, and transmit one H'55 byte to the LSI. If reception cannot be performed normally, initiate boot mode again (reset), and repeat the above operations. Depending on the host's transmission bit rate and the LSI's system clock frequency, there will be a discrepancy between the bit rates of the host and the LSI. Set the host transfer bit rate at 4,800, 9,600 or 19,200 bps to operate the SCI properly.

Table 18.6 shows host transfer bit rates and system clock frequencies for which automatic adjustment of the LSI bit rate is possible. The boot program should be executed within this system clock range.

Table 18.6 System Clock Frequencies for which Automatic Adjustment of LSI Bit Rate Is Possible

Host Bit Rate	System Clock Frequency for Which Automatic Adjustment of LSI Bit Rate is Possible (MHz)
4800 bps	4 to 25
9,600 bps	8 to 25
19,200 bps	16 to 25

Notes: 1. Use a host bit rate setting of 4800, 9600, or 19200 bps only. No other setting should be used.

2. Although the H8/3052BF may also perform automatic bit rate adjustment with bit rate and system clock combinations other than those shown in table 18.6, a degree of error will arise between the bit rates of the host and the H8/3052BF, and subsequent transfer will not be performed normally. Therefore, only combinations of bit rate and system clock within the ranges shown in table 18.6 can be used for boot mode execution.

On-Chip RAM Area Divisions in Boot Mode: In boot mode, the RAM area is divided into an area used by the boot program and an area to which the programming control program is transferred via the SCI, as shown in figure 18.8. The boot program area cannot be used until the execution state in boot mode switches to the programming control program transferred from the host.

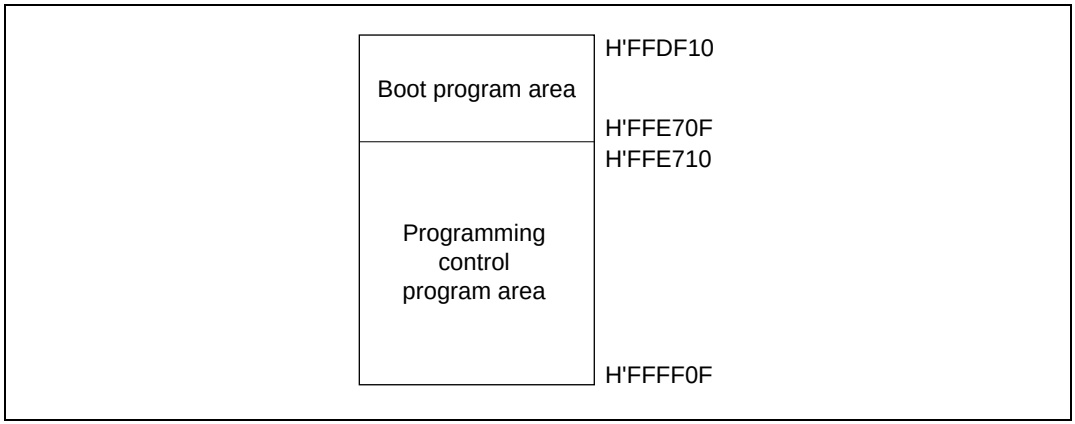


Figure 18.8 RAM Areas in Boot Mode

Notes: 1. The boot program area cannot be used until a transition is made to the execution state for the programming control program transferred to RAM. Note also that the boot program remains in this area of the on-chip RAM even after control branches to the programming control program.

2. In flash memory emulation by RAM, part (H'FE000 to H'FEFFF) of the user program transfer area is used as the area in which emulation is performed, and therefore the user program must not be transferred to this area.

Notes on Using the Boot Mode

1. When this LSI comes out of reset in boot mode, it measures the low period the input at the SCI's RXD_1 pin. The reset should end with RXD_1 high. After the reset ends, it takes about 100 states for this LSI to get ready to measure the low period of the RXD_1 input.
2. If any data has been written to the flash memory (if all data is not H'FF), all flash memory blocks are erased when this mode is executed. Therefore, boot mode should be used for initial on-board programming, or for forced recovery if the program to be activated in user program mode is accidentally erased and user program mode cannot be executed, for example.
3. Interrupts cannot be used during programming or erasing of flash memory.
4. The RXD_1 and TXD_1 pins should be pulled up on the board.

5. This LSI terminates transmit and receive operations by the on-chip SCI(channel 1) (by clearing the RE and TE bits in serial control register (SCR)) before branching to the user program. However, the adjusted bit rate is held in the bit rate register (BRR). At this time, the TXD_1 pin is in the high level output state (P9DDR $P9_1$DDR=1, P9DR $P9_1$DR=1).

   Before branching to the user program the value of the general registers in the CPU are also undefined. Therefore, the general registers must be initialized immediately after control branches to the user program. Since the stack pointer (SP) is implicitly used during subroutine call, etc., a stack area must be specified for use by the user program.

   There are no other internal I/O registers in which the initial value is changed.

6. Transition to the boot mode executes a reset-start of this LSI after setting the MD_0 to MD_2 and FWE pins according to the mode setting conditions shown in table 18.5.

   At this time, this LSI latches the status of the mode pin inside the microcomputer to maintain the boot mode status at the reset clear (startup with Low→ High) timing*1.

   To clear boot mode, it is necessary to drive the FWE pin low during the reset, and then execute reset release*1. The following points must be noted:

   — Before making a transition from the boot mode to the regular mode, the microcomputer boot mode must be reset by reset input via the $\overline{RES}$ pin. At this time, the $\overline{RES}$ pin must be hold at low level for at least 20 system clock.*3

   — Do not change the input levels at the mode pins (MD_2 to MD_0) or the FWE pin while in boot mode. When making a mode transition, first enter the reset state by inputting a low level to the $\overline{RES}$ pin. When a watchdog timer reset was generated in the boot mode, the microcomputer mode is not reset and the on-chip boot program is restarted regardless of the state of the mode pin.

   — Do not input low level to the FWE pin while the boot program is executing and when programming/erasing flash memory.*2

7. If the mode pin and FWE pin input levels are changed from 0 V to V_{CC} or from V_{CC} to 0V during a reset (while a low level is being input to the $\overline{RES}$ pin), the microcomputer's operating mode will change.

   Therefore, since the state of the address dual port and bus control output signals ($\overline{CSn}$, $\overline{RD}$, $\overline{HWR}$, $\overline{LWR}$) changes, use of these pins as output signals during reset must be disabled outside the microcomputer.

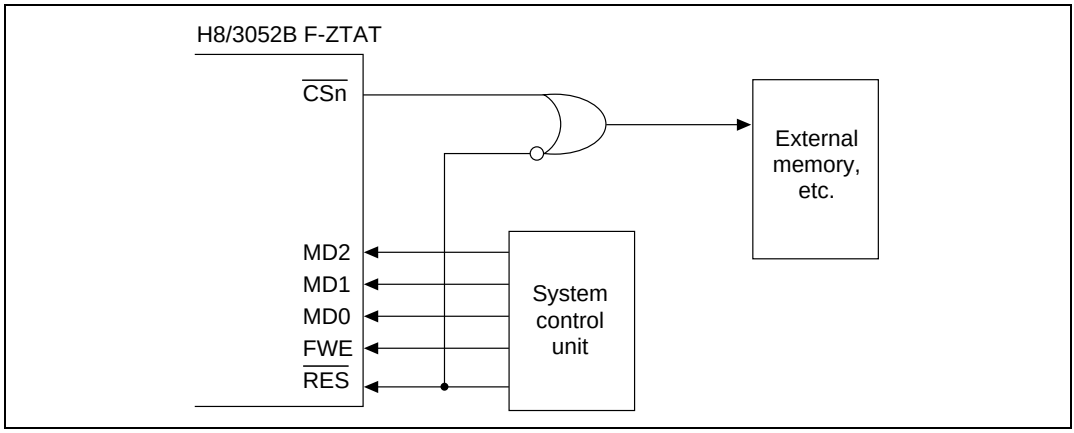

Figure 18.9 Recommended System Block Diagram

Notes: 1. The mode pin and FWE pin input must satisfy the mode programming setup time (t_{MDS}) relative to the reset clear timing.
2. For notes on FWE pin High/Low, see section 18.11, Notes on Flash Memory Programming/Erasing.
3. See section 4.2.2, Reset Sequence and 18.11, Notes on Flash Memory Programming/Erasing. The H8/3052BF requires a minimum of 20 system clocks.

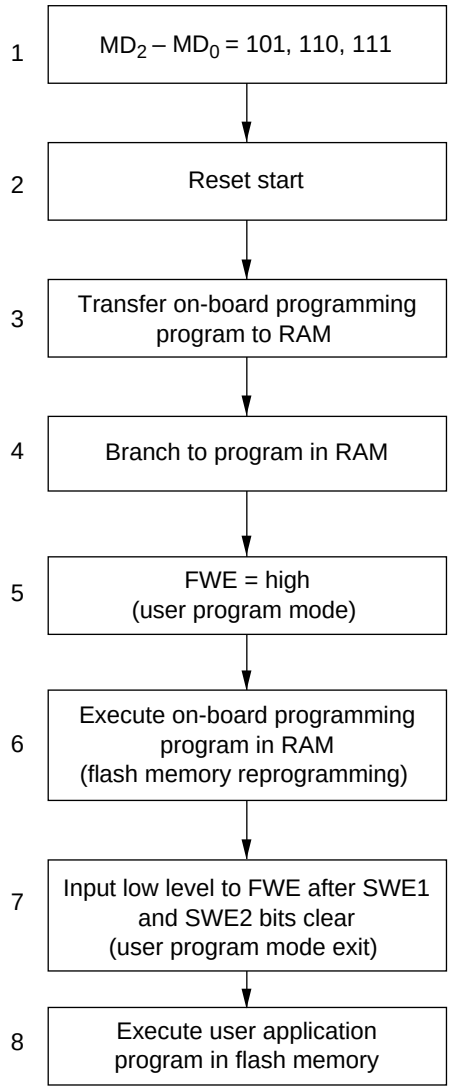
18.6.2 User Program Mode

When set to the user program mode, this LSI can erase and program its flash memory by executing a user program. Therefore, on-chip flash memory on-board programming can be performed by providing a means of controlling FWE and supplying the write data on the board and providing a write program in a part of the program area.

To select this mode, set the LSI to on-chip ROM enable modes 5, 6, and 7 and apply a high level to the FWE pin. In this mode, the peripheral functions, other than flash memory, are performed the same as in modes 5, 6, and 7.

Since the flash memory cannot be read while it is being programmed/erased, place a programming program on external memory, or transfer the programming program to RAM area, and execute it in the RAM.

Figure 18.10 shows the procedure for executing when transferred to on-chip RAM. During reset start, starting from the user program mode is possible.



Procedure

The user writes a program that executes steps 3 to 8 in advance as shown below.

1. Sets the mode pin to an on-chip ROM enable mode (mode 5, 6, or 7).
2. Starts the CPU via reset.
   (The CPU can also be started from the user program mode by setting the FWE pin to high level during reset; that is, during the period the $\overline{RES}$ pin is a low level.)*
3. Transfers the on-board programming program to RAM.
4. Branches to the program in RAM.
5. Sets the FWE pin to a high level.*

   (Switches to user program mode.)
6. After confirming that the FWE pin is a high level, executes the on-board programming program in RAM. This reprograms the user application program in flash memory.
7. At the end of reprograming, clears the SWE1 and SWE2 bit, and exits the user program mode by switching the FWE pin from a high level to a low level.*
8. Branches to, and executes, the user application program reprogrammed in flash memory.

Note: * For notes on FWE pin High/Low, see section 18.11, Notes on Flash Memory Programming/Erasing.

Figure 18.10 User Program Mode Execution Procedure (Example)

Note: Normally do not apply a high level to the FWE pin. To prevent erroneous programming or erasing in the event of program runaway, etc., apply a high level to the FWE pin only when programming/erasing flash memory (including flash memory emulation by RAM). If program runaway, etc. causes overprogramming or overerasing of flash memory, the memory cells will not operate normally.

Also, while a high level is applied to the FWE pin, the watchdog timer should be activated to prevent overprogramming or overerasing due to program runaway, etc.

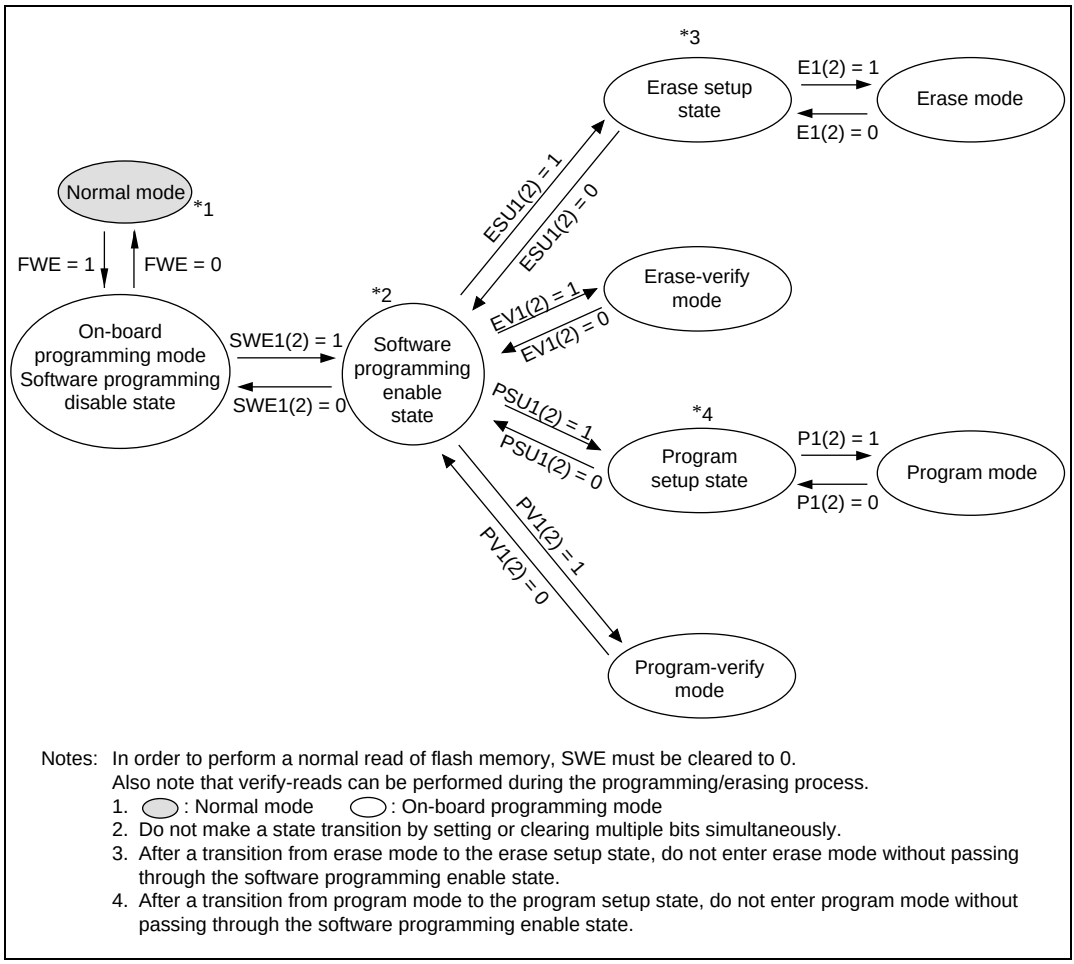
18.7 Programming/Erasing Flash Memory

A software method, using the CPU, is employed to program and erase flash memory in the on-board programming modes. There are four flash memory operating modes: program mode, erase mode, program-verify mode, and erase-verify mode. Transitions to these modes are made by setting the PSU1, ESU1, P1, E1, PV1, and EV1 bits in FLMCR1 for addresses H'00000 to H'3FFFF, or the PSU2, ESU2, P2, E2, PV2, and EV2 bits in FLMCR2 for addresses H'40000 to H'7FFFF.

The flash memory cannot be read while it is being written or erased. Install the program to control flash memory programming and erasing (programming control program) in the on-chip RAM, in external memory, or in flash memory outside the address area, and execute the program from there.

See section 18.1, Notes on Flash Memory Programming/Erasing, for points to be noted when programming or erasing the flash memory. In the following operation descriptions, wait times after setting or clearing individual bits in FLMCR1 and FLMCR2 are given as parameters; for details of the wait times, see section 21.2.5, Flash Memory Characteristics.

Notes:
1. Operation is not guaranteed if bits SWE1, ESU1, PSU1, EV1, PV1, E1, and P1 of FLMCR1 and bits SWE2, ESU2, PSU2, EV2, PV2, E2 and P2 of FLMCR2 are set/reset by a program in flash memory in the corresponding address areas.
2. When programming or erasing, set FWE to 1 (programming/erasing will not be executed if FWE = 0).
3. Programming should be performed in the erased state. Do not perform additional programming on previously programmed addresses.
4. Do not program addresses H'00000 to H'3FFFF and H'40000 to H'7FFFF simultaneously. Operation is not guaranteed if this is done.



Notes: In order to perform a normal read of flash memory, SWE must be cleared to 0.
Also note that verify-reads can be performed during the programming/erasing process.

1. : Normal mode : On-board programming mode
2. Do not make a state transition by setting or clearing multiple bits simultaneously.
3. After a transition from erase mode to the erase setup state, do not enter erase mode without passing through the software programming enable state.
4. After a transition from program mode to the program setup state, do not enter program mode without passing through the software programming enable state.

Figure 18.11 State Transitions Caused by FLMCR1 and FLMCR2 Bit Settings

18.7.1 Program Mode

When writing data or programs to flash memory, the program/program-verify flowchart shown in figure 18.12 should be followed. Performing program operations according to this flowchart will enable data or programs to be written to flash memory without subjecting the device to voltage stress or sacrificing program data reliability. Programming should be carried out 128 bytes at a time.

The wait times after bits are set or cleared in the flash memory control register (FLMCR1, FLMCR2) and the maximum number of programming operations (N) are shown in table 21.10 in section 21.2.5, Flash Memory Characteristics.

Following the elapse of (tsswe) µs or more after the SWE1 and SWE2 bits are set to 1 in FLMCR1 and FLMCR2, 128-byte data is written consecutively to the write addresses. The lower 8 bits of the first address written to must be H'00 and H'80, 128 consecutive byte data transfers are performed. The program address and program data are latched in the flash memory. A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, H'FF data must be written to the extra addresses.

Next, the watchdog timer (WDT) is set to prevent overprogramming due to program runaway, etc. Set a value greater than (tspsu + tsp + tcp + tcpsu) µs as the WDT overflow period. Preparation for entering program mode (program setup) is performed next by setting the PSU1 and PSU2 bits in FLMCR1 and FLMCR2. The operating mode is then switched to program mode by setting the P1 and P2 bits in FLMCR1 and FLMCR2 after the elapse of at least (tspsu) µs. The time during which the P1 and P2 bits are set is the flash memory programming time. Make a program setting so that the time for one programming operation is within the range of (tsp) µs.

The wait time after P1 and P2 bits setting must be changed according to the number of reprogramming loops. For details, see section 21.2.5, Flash Memory Characteristics.

18.7.2 Program-Verify Mode

In program-verify mode, the data written in program mode is read to check whether it has been correctly written in the flash memory.

After the elapse of the given programming time, clear the P1 and P2 bits in FLMCR1 and FLMCR2, then wait for at least (tcp) µs before clearing the PSU1 and PSU2 bits to exit program mode. After exiting program mode, the watchdog timer setting is also cleared. The operating mode is then switched to program-verify mode by setting the PV1 and PV2 bits in FLMCR1 and FLMCR2. Before reading in program-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (tspv) µs or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (tspvr) µs after the dummy write before performing this read operation. Next, the originally written data is compared with the verify data, and reprogram data is computed (see figure 18.12) and transferred to RAM. After verification of 128 bytes of data has been completed, exit program-verify mode, wait for at least (tcpv) µs, then determine whether 128-byte programming has finished. If reprogramming is necessary, set program mode again, and repeat the program/program-verify sequence as before. The maximum value for repetition of the program/program-verify sequence is indicated by the maximum programming count (N). Leave a wait time of at least (tcswe) µs after clearing SWE1 or SWE2.

18.7.3 Notes on Program/Program-Verify Procedure

1. The program/program-verify procedure for the H8/3052BF is a 128-byte-unit programming algorithm.

   In order to perform 128-byte-unit programming, the lower 8 bits of the write start address must be H'00 or H'80.
2. When performing continuous writing of 128-byte data to flash memory, byte-unit transfer should be used.

   128-byte data transfer is necessary even when writing fewer than 128 bytes of data. H'FF data must be written to the extra addresses.
3. Verify data is read in word units.
4. The write pulse is applied and a flash memory write executed while the P1 bit in FLMCR1 or the P2 bit in FLMCR2 is set. In the H8/3052BF, write pulses should be applied as follows in the program/program-verify procedure to prevent voltage stress on the device and loss of write data reliability.
   a. After write pulse application, perform a verify-read in program-verify mode and apply a write pulse again for any bits read as 1 (reprogramming processing). When all the 0-write bits in the 128-byte write data are read as 0 in the verify-read operation, the

program/program-verify procedure is completed. In the H8/3052BF, the number of loops in reprogramming processing is guaranteed not to exceed the maximum programming count (N).

b. After write pulse application, a verify-read is performed in program-verify mode, and programming is judged to have been completed for bits read as 0. The following processing is necessary for programmed bits.

When programming is completed at an early stage in the program/program-verify procedure:

If programming is completed in the 1st to 6th reprogramming processing loop, additional programming should be performed on the relevant bits. Additional programming should only be performed on bits which first return 0 in a verify-read in certain reprogramming processing.

When programming is completed at a late stage in the program/program-verify procedure:

If programming is completed in the 7th or later reprogramming processing loop, additional programming is not necessary for the relevant bits.

c. If programming of other bits is incomplete in the 128 bytes, reprogramming process should be executed. If a bit for which programming has been judged to be completed is read as 1 in a subsequent verify-read, a write pulse should again be applied to that bit.

5. **The period for which the P1 bit in FLMCR1 or the P2 bit in FLMCR2 is set (the write pulse width) should be changed according to the degree of progress through the program/program-verify procedure.** For detailed wait time specifications, see section 21.2.5, Flash Memory Characteristics.

Table 18.7 Wait Time after P Bit Setting

Item	Symbol	Conditions	Symbol
Wait time after P bit setting	t_{sp}	When reprogramming loop count (n) is 1 to 6	$t_{sp}30$
		When reprogramming loop count (n) is 7 or more	$t_{sp}200$
		In case of additional programming processing*	$t_{sp}10$

Note: * Additional programming processing is necessary only when the reprogramming loop count (n) is 1 to 6.

6. The program/program-verify flowchart for the H8/3052BF is shown in figure 18.12.

To cover the points noted above, bits on which reprogramming processing is to be executed, and bits on which additional programming is to be executed, must be determined as shown in tables 18.8 and 18.9.

Since reprogram data and additional-programming data vary according to the progress of the programming procedure, it is recommended that the following data storage areas (128 bytes each) be provided in RAM.

Table 18.8 Reprogram Data Computation Table

(D)	Result of Verify-Read after Write Pulse Application (V)	(X) Result of Operation	Comments
0	0	1	Programming completed: reprogramming processing not to be executed
0	1	0	Programming incomplete: reprogramming processing to be executed
1	0	1	—
1	1	1	Still in erased state: no action

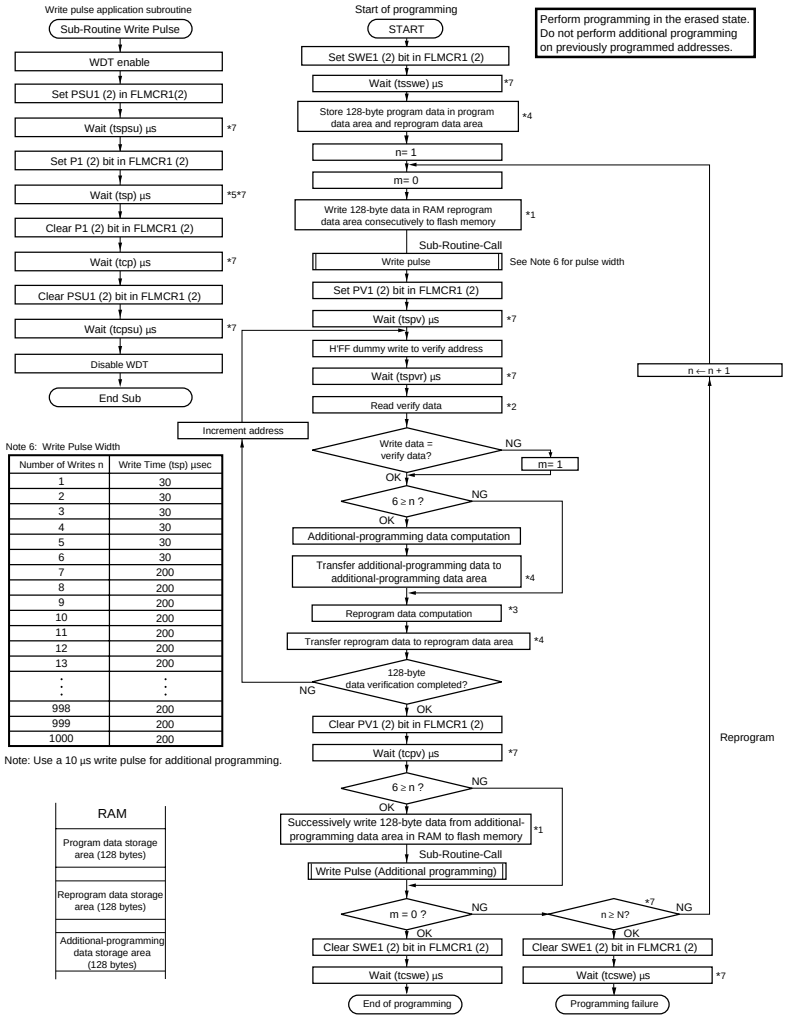
Source data of bits on which programming is executed: (D)
Data of bits on which reprogramming is executed: (X)

Table 18.9 Additional-Programming Data Computation Table

X'	Result of Verify-Read after Write Pulse Application (V)	(Y) Result of Operation	Comments
0	0	0	Programming by write pulse application judged to be completed: additional programming processing to be executed
0	1	1	Programming by write pulse application incomplete: additional programming processing not to be executed
1	0	1	Programming already completed: additional programming processing not to be executed
1	1	1	Still in erased state: no action

Data of bits on which additional programming is executed: (Y)
Data of bits on which reprogramming is executed in a certain reprogramming loop: (X')

7. It is necessary to execute additional programming processing during the course of the H8/3052BF program/program-verify procedure. However, once 128-byte-unit programming is finished, additional programming should not be carried out on the same address area. When executing reprogramming, an erase must be executed first. Note that normal operation of reads, etc., is not guaranteed if additional programming is performed on addresses for which a program/program-verify operation has finished.



Note 6: Write Pulse Width

Number of Writes n	Write Time (tsp) µsec
1	30
2	30
3	30
4	30
5	30
6	30
7	200
8	200
9	200
10	200
11	200
12	200
13	200
⋮	⋮
998	200
999	200
1000	200

Note: Use a 10 µs write pulse for additional programming.

Notes: 1. Data transfer is performed by byte transfer. The lower 8 bits of the first address written to must be H'00 or H'80.
A 128-byte data transfer must be performed even if writing fewer than 128 bytes; in this case, H'FF data must be written to the extra addresses.
2. Verify data is read in 16-bit (W) units.
3. Reprogram data is determined by the operation shown in the table below (comparison between the data stored in the program data area and the verify data). Bits for which the reprogram data is 0 are programmed in the next reprogramming loop. Therefore, even bits for which programming has been completed will be subjected to programming once again if the result of the subsequent verify operation is NG.
4. A 128-byte area for storing program data and a 128-byte area for storing reprogram data must be provided in RAM.
The contents of the reprogram data area are modified as programming proceeds.
5. A write pulse of 30 µs or 200 µs should be applied according to the progress of the programming operation. See Note 6 for the pulse widths. When writing of additional-programming data is executed, a 10 µs write pulse should be applied. Reprogram data X' means reprogram data when the write pulse is applied.
7. The wait times and value of N are shown in section 21.2.5, Flash Memory.

Reprogram Data Computation Table

Original Data (D)	Verify Data (V)	Reprogram Data (X)	Comments
0	0	1	Programming completed
0	1	0	Programming incomplete; reprogram
1	0	1	
1	1	1	Still in erased state; no action

Additional-Programming Data Computation Table

Reprogram Data (X')	Verify Data (V)	Additional-Programming Data (Y')	Comments
0	0	0	Additional programming to be executed
0	1	1	Additional programming not to be executed
1	0	1	Additional programming not to be executed
1	1	1	Additional programming not to be executed

Figure 18.12 Program/Program-Verify Flowchart (128-Byte Programming)

18.7.4 Erase Mode

To erase an individual flash memory block, follow the erase/erase-verify flowchart (single-block erase) shown in figure 18.13.

The wait times after bits are set or cleared in the flash memory control register (FLMCR1, FLMCR2) and the maximum number of erase operations (N) are shown in table 21.10 in section 21.2.5, Flash Memory Characteristics.

To erase flash memory contents, make a 1-bit setting for the flash memory area to be erased in erase block register 1 and 2 (EBR1, EBR2) at least (tsswe) µs after setting the SWE1 and SWE2 bits to 1 in FLMCR1 and FLMCR2. Next, the watchdog timer (WDT) is set to prevent overerasing due to program runaway, etc. Set a value greater than (tse) ms + (tsesu + tce + tcesu) µs as the WDT overflow period. Preparation for entering erase mode (erase setup) is performed next by setting the ESU1 and ESU2 bits in FLMCR1 and FLMCR2. The operating mode is then switched to erase mode by setting the E1 and E2 bits in FLMCR1 and FLMCR2 after the elapse of at least (tsesu) µs. The time during which the E1 and E2 bits are set is the flash memory erase time. Ensure that the erase time does not exceed (tse) ms.

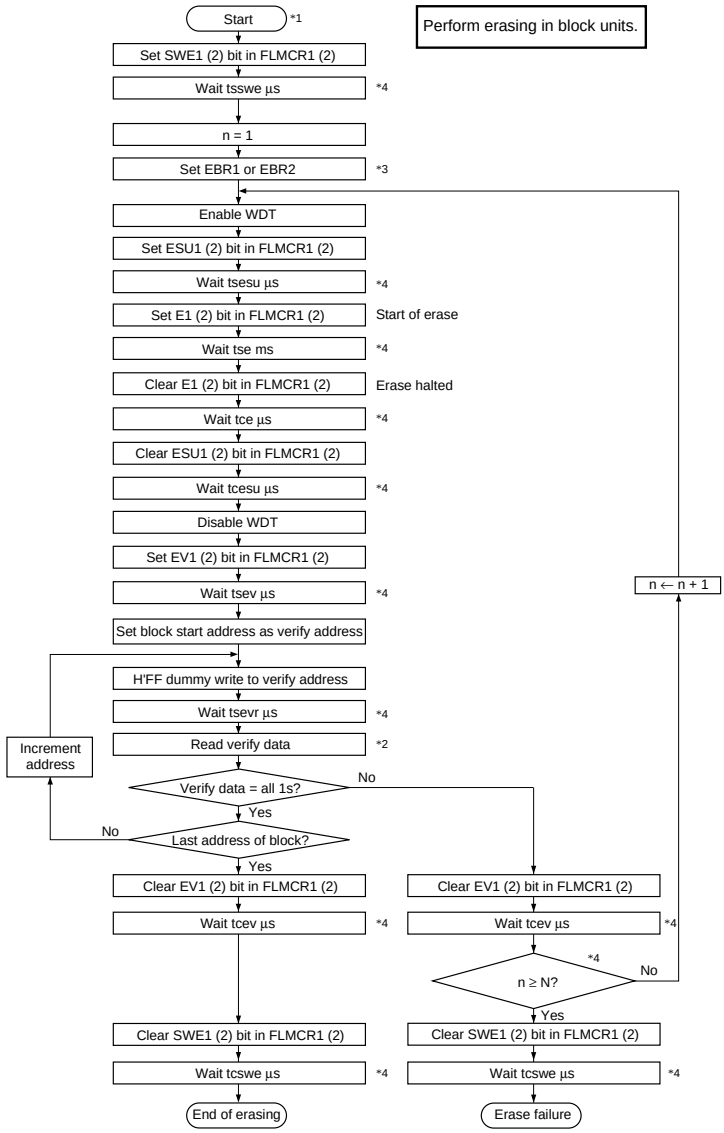
Note: With flash memory erasing, preprogramming (setting all memory data in the memory to be erased to all 0) is not necessary before starting the erase procedure.

18.7.5 Erase-Verify Mode

In erase-verify mode, data is read after memory has been erased to check whether it has been correctly erased.

After the elapse of the fixed erase time, clear the E1 and E2 bits in FLMCR1 and FLMCR2, then wait for at least (tce) µs before clearing the ESU1 and ESU2 bits to exit erase mode. After exiting erase mode, the watchdog timer setting is also cleared. The operating mode is then switched to erase-verify mode by setting the EV1 and EV2 bits in FLMCR1 and FLMCR2. Before reading in erase-verify mode, a dummy write of H'FF data should be made to the addresses to be read. The dummy write should be executed after the elapse of (tsev) µs or more. When the flash memory is read in this state (verify data is read in 16-bit units), the data at the latched address is read. Wait at least (tsevr) µs after the dummy write before performing this read operation. If the read data has been erased (all 1), a dummy write is performed to the next address, and erase-verify is performed. If the read data is unerased, set erase mode again, and repeat the erase/erase-verify sequence as before. The maximum value for repetition of the erase/erase-verify sequence is indicated by the maximum erase count (N). When verification is completed, exit erase-verify mode, and wait for at least (tcev) µs. If erasure has been completed on all the erase blocks, clear bits SWE1 and SWE2 in FLMCR1 and FLMCR2, and leave a wait time of at least (tcswe) µs.

If erasing multiple blocks, set a single bit in EBR1/EBR2 for the next block to be erased, and repeat the erase/erase-verify sequence as before.



Notes: 1. Prewriting (setting erase block data to all 0s) is not necessary.
2. Verify data is read in 16-bit (W) units.
3. Make only a single-bit specification in the erase block registers (EBR1 and EBR2). Two or more bits must not be set simultaneously.
4. The wait times and the value of N are shown in section 21.2.5, Flash Memory Characteristics.

Figure 18.13 Erase/Erase-Verify Flowchart (Single-Block Erase)

18.8 Protection

There are three kinds of flash memory program/erase protection: hardware protection, software protection, and error protection.

18.8.1 Hardware Protection

Hardware protection refers to a state in which programming/erasing of flash memory is forcibly disabled or aborted. Hardware protection is reset by settings in flash memory control register 1 (FLMCR1), flash memory control register 2 (FLMCR2), erase block register 1 (EBR1), and erase block register 2 (EBR2). In the error-protected state, the FLMCR1, FLMCR2, EBR1, and EBR2 settings are retained; the P1 and P2 bits can be set, but a transition is not made to program mode or erase mode. (See table 18.10.)

Table 18.10 Hardware Protection

Item	Description	Functions		
		Program	Erase	Verify[*1]
FWE pin protection	• When a low level is input to the FWE pin, FLMCR1, FLMCR2, (except bit FLER) EBR1, and EBR2 are initialized, and the program/erase-protected state is entered.[*5]	No[*2]	No[*3]	—
Reset/ standby protection	• In a power-on reset (including a WDT power-on reset) and in standby mode, FLMCR1, FLMCR2, EBR1, and EBR2 are initialized, and the program/erase-protected state is entered. • In a reset via the $\overline{\text{RES}}$ pin, the reset state is not entered unless the $\overline{\text{RES}}$ pin is held low until oscillation stabilizes after powering on. In the case of a reset during operation, hold the $\overline{\text{RES}}$ pin low for the $\overline{\text{RES}}$ pulse width specified in the AC Characteristics section. [*6]	No	No[*3]	—
Error protection	• When a microcomputer operation error (error generation (FLER=1)) was detected while flash memory was being programmed/erased, error protection is enabled. At this time, the FLMCR1, FLMCR2, EBR1, and EBR2 settings are held, but programming/erasing is aborted at the time the error was generated. Error protection is released only by a reset via the $\overline{\text{RES}}$ pin or a WDT reset, or in the hardware standby mode.	No	No[*3]	Yes[*4]

Notes: 1. Two modes: program-verify and erase-verify.
2. Excluding a RAM area overlapping flash memory.
3. All blocks are unerasable and block-by-block specification is not possible.
4. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify operation on the block being erased.
5. For details see section 18.11, Flash Memory Programming and Erasing Precautions.
6. See section 4.2.2, Reset Sequence, and section 18.11, Flash Memory Programming and Erasing Precautions. The H8/3052BF requires at least 20 system clocks for a reset during operation.

18.8.2 Software Protection

Software protection can be implemented by setting the SWE1 bit in FLMCR1, the SWE2 bit in FLMCR2, erase block register 1 (EBR1), erase block register 2 (EBR2), and the RAMS bit in the RAM control register (RAMCR). When software protection is in effect, setting the P1 or E1 bit in flash memory control register 1 (FLMCR1), or the P2 or E2 bit in flash memory control register 2 (FLMCR2) does not cause a transition to program mode or erase mode. (See table 18.11.)

Table 18.11 Software Protection

		Functions		
Item	**Description**	**Program**	**Erase**	**Verify**[*1]
Block specification protection	• Erase protection can be set for individual blocks by settings in erase block register 1 (EBR1)[*2] and erase block register 2 (EBR2)[*2]. However, programming protection is disabled. • Setting EBR1 and EBR2 to H'00 places all blocks in the erase-protected state.	—	No	Yes
Emulation protection	• Setting the RAMS bit to 1 in the RAM control register (RAMCR) places all blocks in the program/erase-protected state.	No[*3]	No[*4]	Yes

Notes: 1. Two modes: program-verify and erase-verify.
2. When not erasing, clear all EBR1, EBR2 bits to H'00.
3. A RAM area overlapping flash memory can be written to.
4. All blocks are unerasable and block-by-block specification is not possible.

18.8.3 Error Protection

In error protection, an error is detected when H8/3052BF runaway occurs during flash memory programming/erasing*1, or operation is not performed in accordance with the program/erase algorithm, and the program/erase operation is aborted. Aborting the program/erase operation prevents damage to the flash memory due to overprogramming or overerasing.

If the H8/3052BF malfunctions during flash memory programming/erasing, the FLER bit is set to 1 in FLMCR2 and the error protection state is entered. The FLMCR1, FLMCR2, EBR1, and EBR2 settings*3 are retained, but program mode or erase mode is aborted at the point at which the error occurred. Program mode or erase mode cannot be re-entered by re-setting the P1, P2, E1, or E2 bit. However, PV1, PV2, EV1 and EV2 bit setting is enabled, and a transition can be made to verify mode.*2

FLER bit setting conditions are as follows:

1. When the flash memory of the relevant address area is read during programming/erasing (including vector read and instruction fetch)
2. Immediately after exception handling (excluding a reset) during programming/erasing
3. When a SLEEP instruction (including software standby) is executed during programming/erasing
4. When the CPU releases the bus to the DMAC during programming/erasing

Error protection is released only by a power-on reset and in hardware standby mode.

Notes: 1. State in which the P1 bit or E1 bit in FLMCR1, or the P2 bit or E2 bit in FLMCR2, is set to 1. Note that NMI input is disabled in this state.
2. It is possible to perform a program-verify operation on the 128 bytes being programmed, or an erase-verify on the block being erased.
3. FLMCR1, FLMCR2, EBR1, and EBR2 can be written to. However, the registers are initialized if a transition is made to software standby mode while in the error-protected state.

Figure 18.14 shows the flash memory state transition diagram.

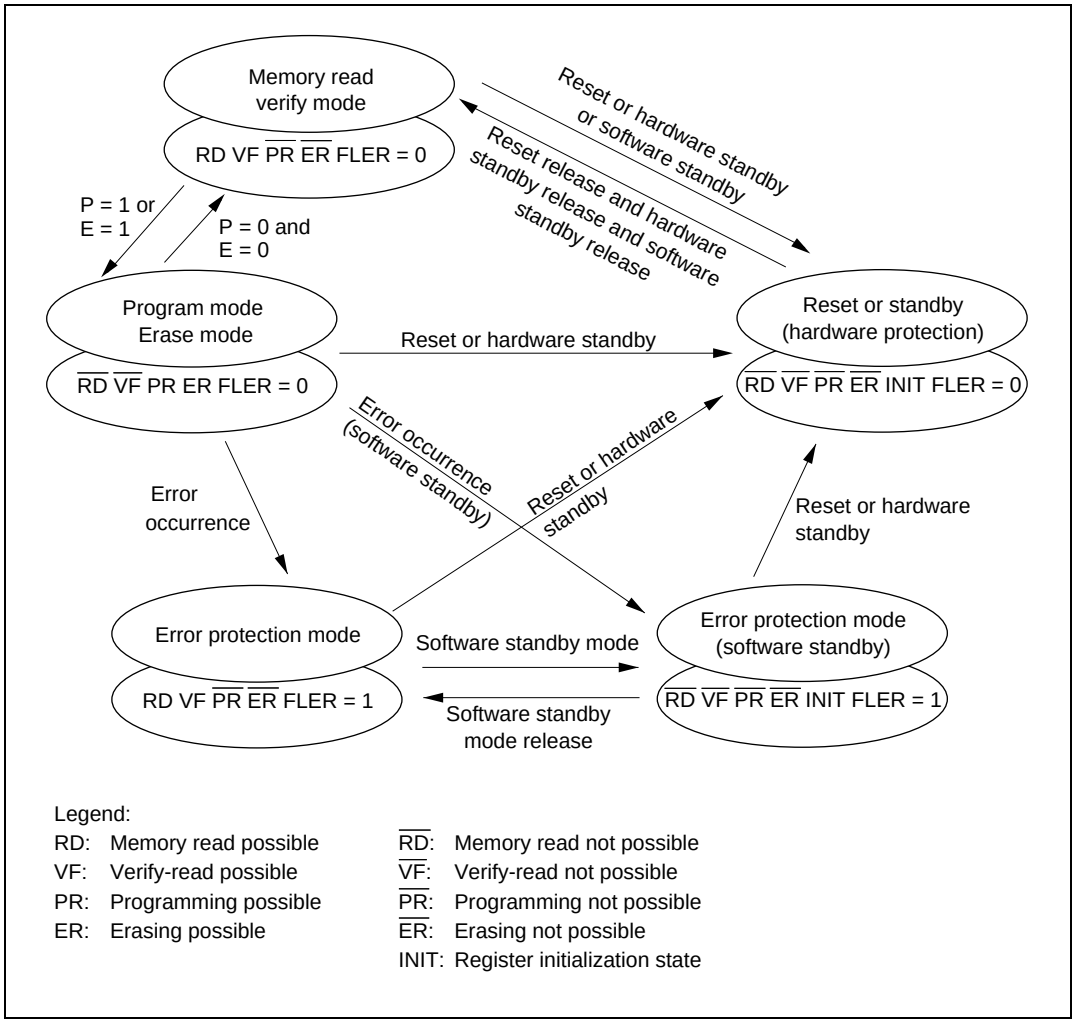


Figure 18.14 Flash Memory State Transitions (Modes 5, 6, and 7 (On-Chip ROM Enabled), High Level Applied to FWE Pin)

18.8.4 NMI Input Disable Conditions

While flash memory is being programed/erased and the boot program is executing in the boot mode (however, period up to branching to on-chip RAM area)*1, NMI input is disabled because the programming/erasing operations have priority.

This is done to avoid the following operation states:

1. Generation of an NMI input during programming/erasing violates the program/erase algorithms and normal operation can not longer be assured.
2. Vector-read cannot be carried out normally*2 during NMI exception handling during programming/erasing and the microcomputer runs away as a result.
3. If an NMI input is generated during boot program execution, the normal boot mode sequence cannot be executed.

Therefore, this LSI has conditions that exceptionally disable NMI inputs only in the on-board programming mode. However, this does not assure normal programming/erasing and microcomputer operation.

Thus, in the FWE application state, all requests, including NMI, inside and outside the microcomputer, exception handling, and bus release must be restricted. NMI input is also disabled*3 in the error-protected state and when the P1 bit or E1 bit in FLMCR1, or the P2 bit or E2 bit in FLMCR2, is retained during flash memory emulation by RAM.

Notes: 1. Indicates the period up to branching to the on-chip RAM boot program area (H'FFDF10). (This branch occurs immediately after user program transfer was completed.)

Therefore, after branching to RAM area, NMI input is enabled in states other than the program/erase state. Thus, interrupt requests inside and outside the microcomputer must be disabled until initial writing by user program (writing of vector table and NMI processing program, etc.) is completed.

2. In this case, vector read is not performed normally for the following two reasons:
   a. The correct value cannot be read even by reading the flash memory during programming/erasing. (Value is undefined.)
   b. If a value has not yet been written to the NMI vector table, NMI exception handling will not be performed correctly.
3. When the emulation function is used, NMI input is prohibited when the P1 bit or E1 bit in FLMCR1, or the P2 bit or E2 bit in FLMCR2, is set to 1, in the same way as with normal programming and erasing. The P1 and E1 bits and the P2 and E2 bits are cleared by a reset (including a watchdog timer reset), in standby mode, when a high level is not being input to the FWE pin, or when the SWE1 bit in FLMCR1 is 0, or the SWE2 bit in FLMCR2 is 0, while a high level is being input to the FWE pin.

18.9 Flash Memory Emulation in RAM

Making a setting in the RAM control register (RAMCR) enables part of RAM to be overlapped onto the flash memory area so that data to be written to flash memory can be emulated in RAM in real time. After the RAMCR setting has been made, accesses can be made from the flash memory area or the RAM area overlapping flash memory. Emulation can be performed in user mode and user program mode. Figure 18.15 shows an example of emulation of real-time flash memory programming.

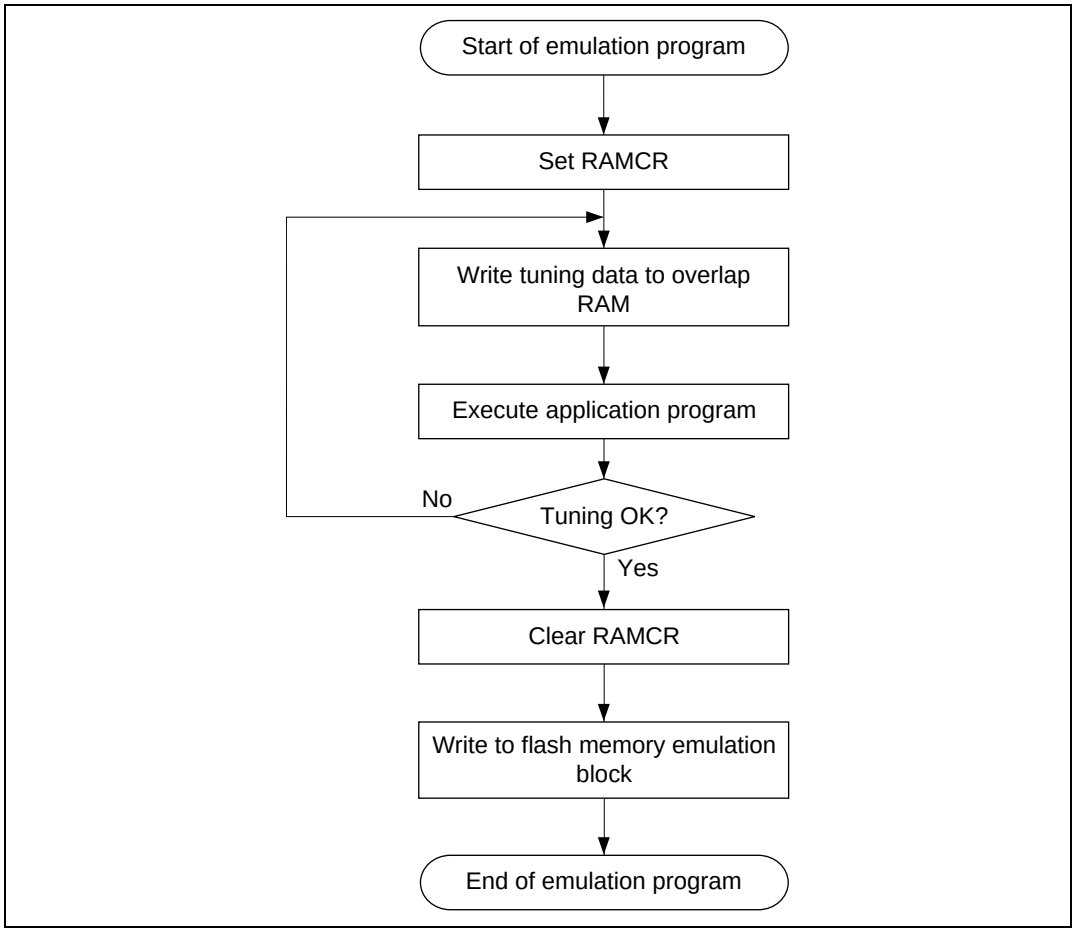

Figure 18.15 Flowchart for Flash Memory Emulation in RAM

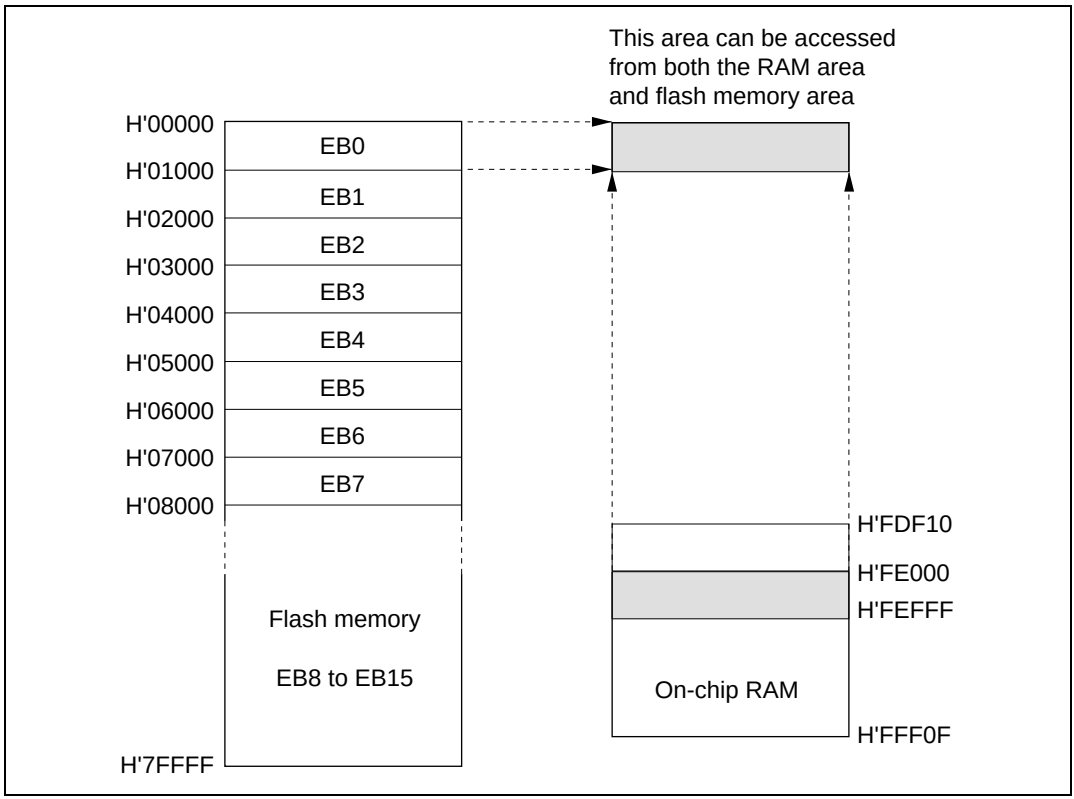

Figure 18.16 Example of RAM Overlap Operation

Example in which Flash Memory Block Area EB0 is Overlapped

1. Set bits RAMS, RAM2 to RAM0 in RAMCR to 1, 0, 0, 0, to overlap part of RAM onto the area (EB0) for which real-time programming is required.
2. Real-time programming is performed using the overlapping RAM.
3. After the program data has been confirmed, clear the RAMS bit to release RAM overlap.
4. Write the data written in the overlapping RAM into the flash memory space (EB0).

Notes: 1. When the RAMS bit is set to 1, program/erase protection is enabled for all blocks regardless of the value of RAM2 to RAM0 (emulation protection). In this state, setting the P1 or E1 bit in flash memory control register 1 (FLMCR1), or the P2 or E2 bit in flash memory control register 2 (FLMCR2), will not cause a transition to program mode or erase mode. When actually programming or erasing a flash memory area, the RAMS bit should be cleared to 0.

2. A RAM area cannot be erased by execution of software in accordance with the erase algorithm while flash memory emulation in RAM is being used.
3. Block area EB0 includes the vector table. When performing RAM emulation, the vector table is needed by the overlap RAM.
4. Flash write enable (FWE) application and releasing

   As in on-board programming mode, care is required when applying and releasing FWE to prevent erroneous programming or erasing. To prevent erroneous programming and erasing due to program runaway during FWE application, in particular, the watchdog timer should be set when the P1 or E1 bit in FLMCR1, or the P2 or E2 bit in FLMCR2, is set to 1, even while the emulation function is being used. For details, see section 18.11, Flash Memory Programming and Erasing Precautions.
5. When the emulation function is used, NMI input is prohibited when the P1 bit or E1 bit in FLMCR1, or the P2 bit or E2 bit in FLMCR2, is set to 1, in the same way as with normal programming and erasing. The P1 and E1 bits and the P2 and E2 bits are cleared by a reset (including a watchdog timer reset), in standby mode, when a high level is not being input to the FWE pin, or when the SWE1 bit in FLMCR1 is 0, or the SWE2 bit in FLMCR2 is 0, while a high level is being input to the FWE pin.

18.10 Flash Memory PROM Mode

The H8/3052BF has a PROM mode as well as the on-board programming modes for programming and erasing flash memory. In PROM mode, the on-chip ROM can be freely programmed using a general-purpose PROM writer that supports the Renesas Technology microcomputer device type with 512-kbyte on-chip flash memory.

18.10.1 Socket Adapters and Memory Map

In PROM mode using a PROM writer, memory reading (verification) and writing and flash memory initialization (total erasure) can be performed. For these operations, a special socket adapter is mounted in the PROM writer. The socket adapter product codes are given in table 18.12. In the H8/3052BF PROM mode, only the socket adapters shown in this table should be used.

Table 18.12 H8/3052BF Socket Adapter Product Codes

Product Code	Package	Socket Adapter Product Code	Manufacturer
HD64F3052BF	100-pin QFP (FP-100B)	ME3064ESHF1H	Minato Electronics
HD64F3052BTE	100-pin TQFP (TFP-100B)	ME3064ESNF1H	
HD64F3052BF	100-pin QFP (FP-100B)	HF306BQ100D4001	Data IO Japan
HD64F3052BTE	100-pin TQFP (TFP-100B)	HF306BT100D4001	

Figure 18.17 shows the memory map in PROM mode.

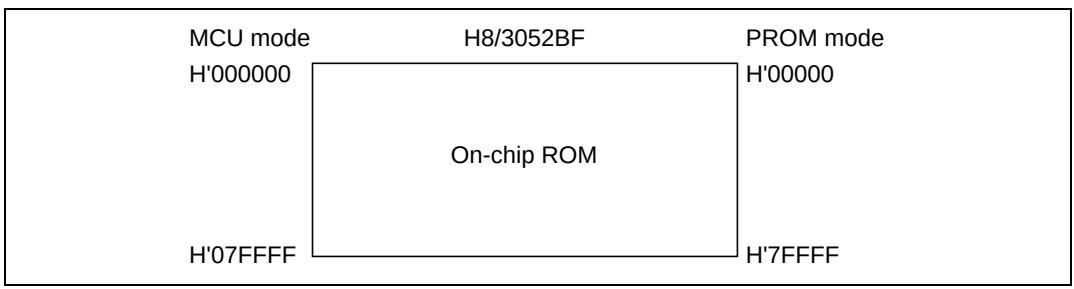

Figure 18.17 Memory Map in PROM Mode

18.10.2 Notes on Use of PROM Mode

1. A write to a 128-byte programming unit in PROM mode should be performed once only. Erasing must be carried out before reprogramming an address that has already been programmed.
2. When using a PROM writer to reprogram a device on which on-board programming/erasing has been performed, it is recommended that erasing be carried out before executing programming.
3. The memory is initially in the erased state when the device is shipped by Renesas. For samples for which the erasure history is unknown, it is recommended that erasing be executed to check and correct the initialization (erase) level.
4. The H8/3052BF does not support a product identification mode as used with general-purpose EPROMs, and therefore the device name cannot be set automatically in the PROM writer.

5. Refer to the instruction manual provided with the socket adapter, or other relevant documentation, for information on PROM writers and associated program versions that are compatible with the PROM mode of the H8/3052BF.

18.11 Notes on Flash Memory Programming/Erasing

The following describes notes when using the on-board programming mode, RAM emulation function, and PROM mode.

1. Program/erase with the specified voltage and timing.

   Applied voltages in excess of the rating can permanently damage the device.

   Use a PROM writer that supports the Renesas 512 kbytes flash memory on-board microcomputer device type.

   If the wrong device type is set, a high level may be input to the FWE pin, resulting in permanent damage to the device.
2. Notes on powering on/powering off (See figures 18.18 to 18.20)

   Input a high level to the FWE pin after verifying Vcc. Before turning off Vcc, set the FWE pin to a low level.

   When powering on and powering off the Vcc power supply, fix the FWE pin low and set the flash memory to the hardware protection mode.

   Be sure that the powering on and powering off timing is satisfied even when the power is turned off and back on in the event of a power interruption, etc. If this timing is not satisfied, microcomputer runaway, etc., may cause overprogramming or overerasing and the memory cells may not operate normally.
3. Notes on FWE pin High/Low switching (See figures 18.18 to 18.20)

   Input FWE in the state microcomputer operation is verified. If the microcomputer does not satisfy the operation confirmation state, fix the FWE pin low to set the protection mode.

   To prevent erroneous programming/erasing of flash memory, note the following in FWE pin High/Low switching:

   a. Apply an input to the FWE pin after the Vcc voltage has stabilized within the rated voltage.

      If an input is applied to the FWE pin when the microcomputer Vcc voltage does not satisfy the rated voltage, flash memory may be erroneously programmed or erased because the microcomputer is in the unconfirmed state.

   b. Apply an input to the FWE pin when the oscillation has stabilized (after the oscillation stabilization time).

      When turning on the Vcc power, apply an input to the FWE pin after holding the $\overline{\text{RES}}$ pin at a low level during the oscillation stabilization time (t_{osc1} = 20 ms). Do not apply an input to the FWE pin when oscillation is stopped or unstable.

c. In the boot mode, perform FWE pin High/Low switching during reset.

In transition to the boot mode, input FWE = High level and set MD_2 to MD_0 while the $\overline{RES}$ input is low. At this time, the FWE and MD_2 to MD_0 inputs must satisfy the mode programming setup time (t_{MDS}) relative to the reset clear timing. The mode programming setup time is necessary for $\overline{RES}$ reset timing even in transition from the boot mode to another mode.

In reset during operation, the $\overline{RES}$ pin must be held at a low level for at least 20 system clocks.

d. In the user program mode, FWE = High/Low switching is possible regardless of the $\overline{RES}$ input.

FWE input switching is also possible during program execution on flash memory.

e. Apply an input to FWE when the program is not running away.

When applying an input to the FWE pin, the program execution state must be supervised using a watchdog timer, etc.

f. Release FWE pin input only when the SWE1, ESU1, PSU1, EV1, PV1, E1, and P1 bits in FLMCR1, and the SWE2, ESU2, PSU2, EV2, PV2, E2, and P2 bits in FLMCR2, are cleared.

Do not erroneously set any of bits SWE1, ESU1, PSU1, EV1, PV1, E1, P1, SWE2, ESU2, PSU2, EV2, PV2, E2, or P2 when applying or releasing FWE.

4. Do not input a constant high level to the FWE pin.

To prevent erroneous programming/erasing in the event of program runaway, etc., input a high level to the FWE pin only when programming/erasing flash memory (including flash memory emulation by RAM). Avoid system configurations that constantly input a high level to the FWE pin. Handle program runaway, etc. by starting the watchdog timer so that flash memory is not overprogrammed/overerased even while a high level is input to the FWE pin.

5. Program/erase the flash memory in accordance with the recommended algorithms.

The recommended algorithms can program/erase the flash memory without applying voltage stress to the device or sacrificing the reliability of the program data.

When setting the PSU1 and ESU1 bits in FLMCR1, or PSU2 and ESU2 bits in FLMCR2 set the watchdog timer for program runaway, etc.

Accesses to flash memory by means of an MOV instruction, etc., are prohibited while bit P1/P2 or bit E1/E2 is set.

6. Do not set/clear the SWE bit while a program is executing on flash memory.

Before performing flash memory program execution or data read, clear the SWE bit.

If the SWE bit is set, the flash data can be reprogrammed, but flash memory cannot be accessed for purposes other than verify (verify during programming/erase).

Similarly perform flash memory program execution and data read after clearing the SWE bit even when using the RAM emulation function with a high level input to the FWE pin. However, RAM area that overlaps flash memory space can be read/programmed whether the SWE bit is set or cleared.

7. Do not use an interrupt during flash memory programming or erasing.

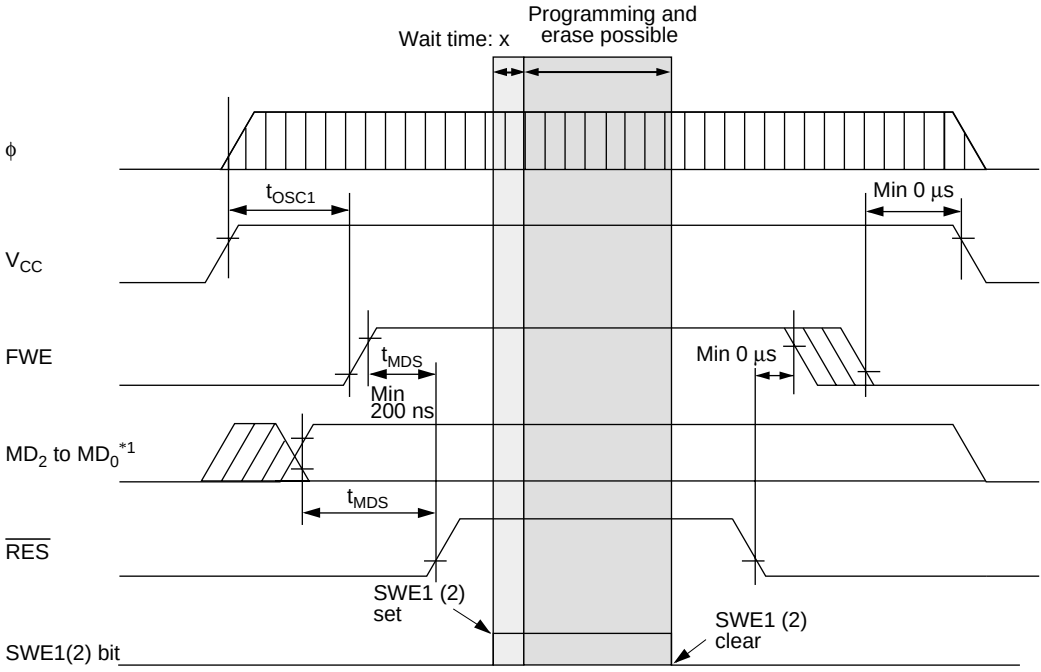
   Since programming/erase operations (including emulation by RAM) have priority when a high level is input to the FWE pin, disable all interrupt requests, including NMI.

8. Do not perform additional programming. Reprogram flash memory after erasing.

   With on-board programming, program to 128-byte programming unit blocks one time only. Program to 128-byte programming unit blocks one time only even in the writer mode. Erase all the programming unit blocks before reprogramming.

9. Before programming, check that the chip is correctly mounted in the PROM programmer. Overcurrent damage to the device can result if the index marks on the PROM programmer socket, socket adapter, and chip are not correctly aligned.

10. Do not touch the socket adapter or chip during programming. Touching either of these can cause contact faults and write errors.

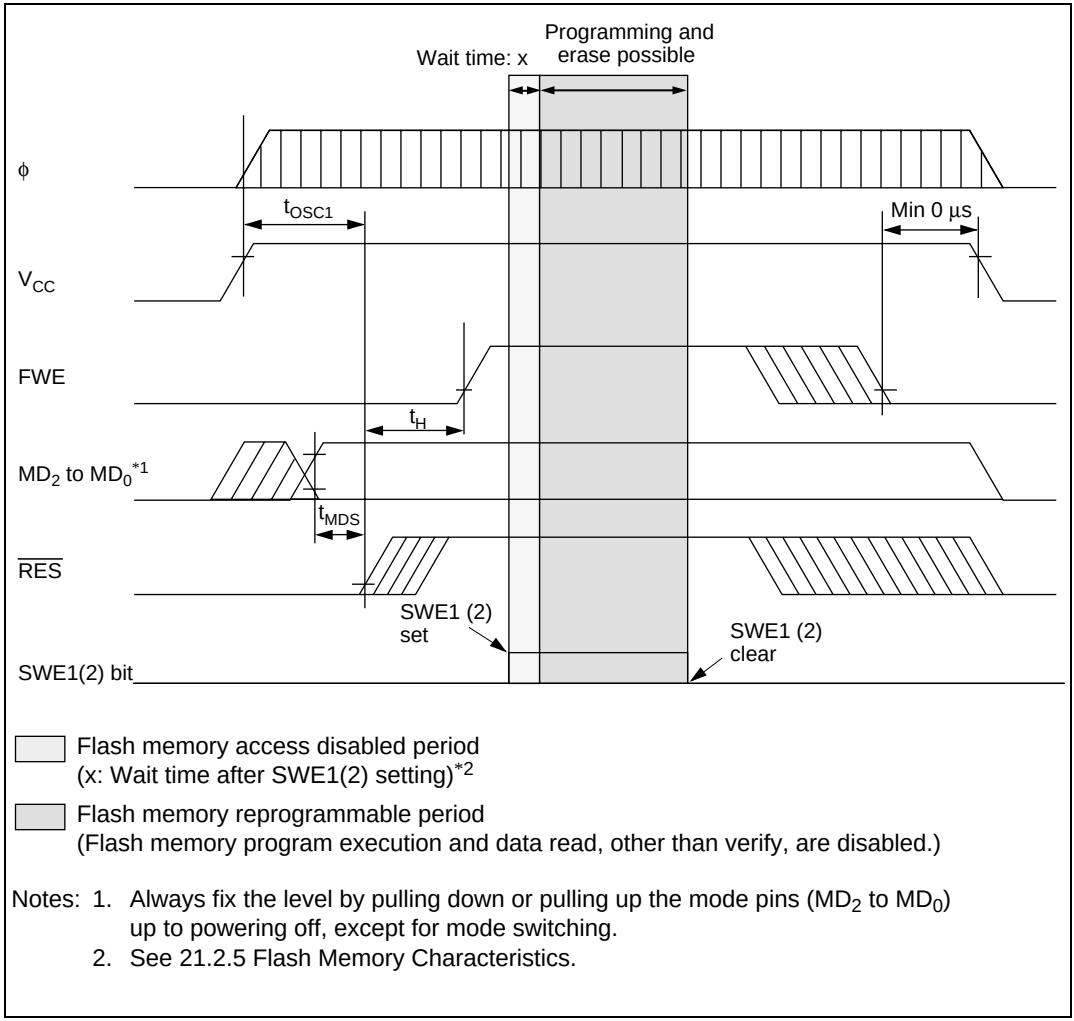


Flash memory access disabled period
(x: Wait time after SWE1 (2) setting)*2

Flash memory reprogrammable period
(Flash memory program execution and data read, other than verify, are disabled.)

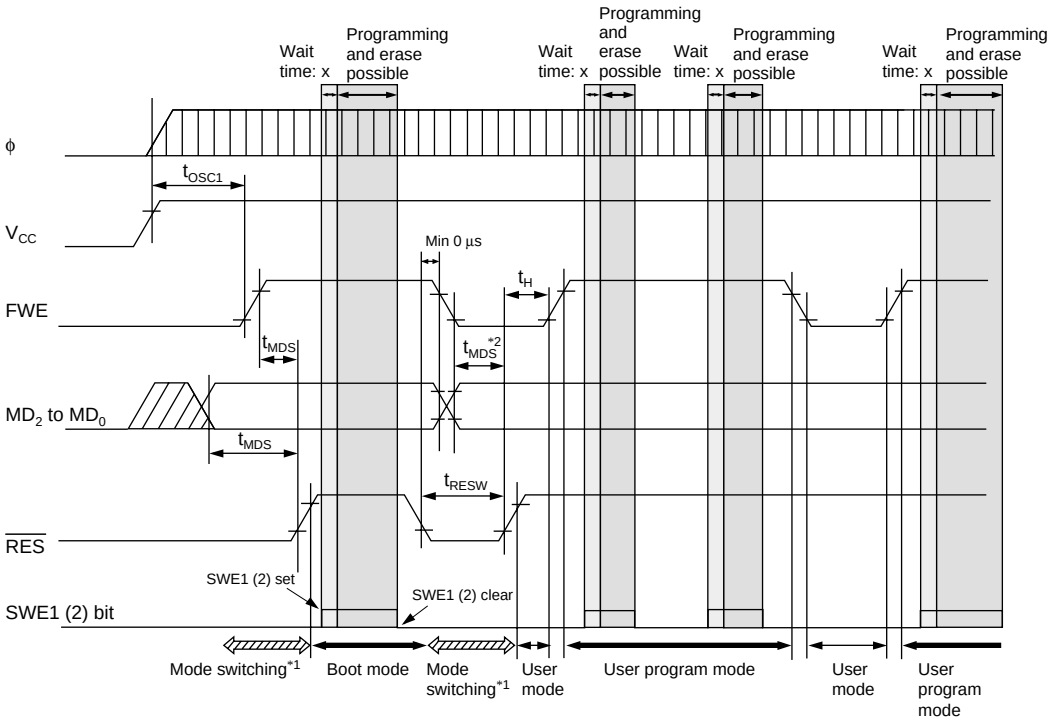
Notes: 1. Always fix the level by pulling down or pulling up the mode pins (MD_2 to MD_0) until powering off, except for mode switching.
2. See 21.2.5 Flash Memory Characteristics.

Figure 18.18 Powering On/Off Timing (Boot Mode)



Notes: 1. Always fix the level by pulling down or pulling up the mode pins (MD_2 to MD_0) up to powering off, except for mode switching.
2. See 21.2.5 Flash Memory Characteristics.

Figure 18.19 Powering On/Off Timing (User Program Mode)



Flash memory access disabled time
(x: Wait time after SWE1 (2) setting)*3

Flash memory reprogammable period
(Flash memory program execution and data read, other than verify, are disabled.)

Notes: 1. In transition to the boot mode and transition from the boot mode to another mode, mode switching via $\overline{RES}$ input is necessary.
During this switching period (period during which a low level is input to the $\overline{RES}$ pin),the state of the address dual port and bus control output signals ($\overline{AS}$, $\overline{RD}$, $\overline{WR}$) changes.
Therefore, do not use these pins as output signals during this switching period.

2. When making a transition from the boot mode to another mode, the mode programming setup time t_{MDS} relative to the $\overline{RES}$ clear timing is necessary.

3. See 21.2.5 Flash Memory Characteristics.

Figure 18.20 Mode Transition Timing
(Example: Boot mode → User mode ↔ User program mode)

Section 19 Clock Pulse Generator

19.1 Overview

The H8/3052BF has a built-in clock pulse generator (CPG) that generates the system clock (φ) and other internal clock signals (φ/2 to φ/4096). After duty adjustment, a frequency divider divides the clock frequency to generate the system clock (φ). The system clock is output at the φ pin*1 and furnished as a master clock to prescalers that supply clock signals to the on-chip supporting modules. Frequency division ratios of 1/1, 1/2, 1/4, and 1/8 can be selected*2 for the frequency divider by settings in a division control register (DIVCR). Power consumption in the chip is reduced in almost direct proportion to the frequency division ratio.

Notes: 1. Usage of the φ pin differs depending on the chip operating mode and the PSTOP bit setting in the module standby control register (MSTCR). For details, see section 20.7, System Clock Output Disabling Function.

2. The division ratio of the frequency divider can be changed dynamically during operation. The clock output at the φ pin also changes when the division ratio is changed. The frequency output at the φ pin is shown below.

$$\phi = \mathrm{EXTAL} \times n$$

where, EXTAL: Frequency of crystal resonator or external clock signal
n: Frequency division ratio (n = 1/1, 1/2, 1/4, or 1/8)

19.1.1 Block Diagram

Figure 19.1 shows a block diagram of the clock pulse generator.

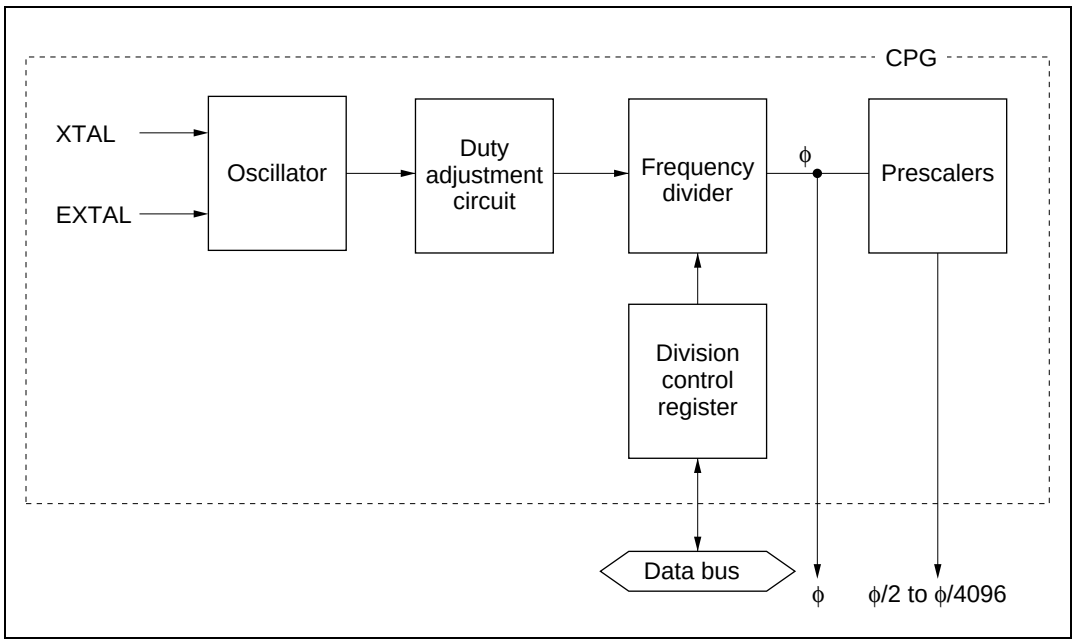


Figure 19.1 Block Diagram of Clock Pulse Generator

19.2 Oscillator Circuit

Clock pulses can be supplied by connecting a crystal resonator, or by input of an external clock signal.

19.2.1 Connecting a Crystal Resonator

Circuit Configuration: A crystal resonator can be connected as in the example in figure 19.2. The damping resistance Rd should be selected according to table 19.1 (1). Use capacitors with the characteristics listed in table 19.1 (2) for external capacitors C_{L1} and C_{L2}. An AT-cut parallel-resonance crystal should be used.

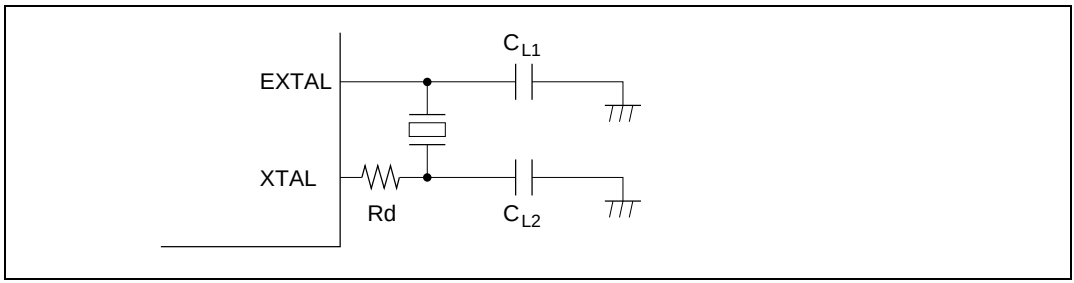

Figure 19.2 Connection of Crystal Resonator (Example)

If a crystal resonator with a frequency higher than 20 MHz is connected,the external load capacitance values in table 20.1 (2) should not exceed 10[pF] Also,in order to improve the accuracy of the oscillation frequency a thorough study of oscillation matching evaluation etc. should be carried out when deciding the circuit constants.

Table 19.1 (1) Damping Resistance Value

Damping Resistance Value	Frequency f (MHz)								
	2	2 < f ≤ 4	4 < f ≤ 8	8 < f ≤ 10	10 < f ≤ 13	13 < f ≤ 16	16 < f ≤ 18	18 < f ≤ 25	20 < f ≤ 25
Rd (Ω)	1 k	1 k	500	200	100	0	0	0	0

Note: A crystal resonator between 2 MHz and 25 MHz can be used. If the chip is to be operated at less than 2 MHz, the on-chip frequency divider should be used. (A crystal resonator of less than 2 MHz cannot be used.)

Table 19.1 (2) External Capacitance Values

External Capacitance Values	5V operation		3V operation	
Frequency f (MHz)	20 < f ≤ 25	2≤ f ≤ 20	2≤ f ≤ 13	13≤ f ≤ 25
$C_{L1} = C_{L2}$ (pF)	10	10 to 22	10 to 22	10

Crystal Resonator: Figure 19.3 shows an equivalent circuit of the crystal resonator. The crystal resonator should have the characteristics listed in table 19.2.

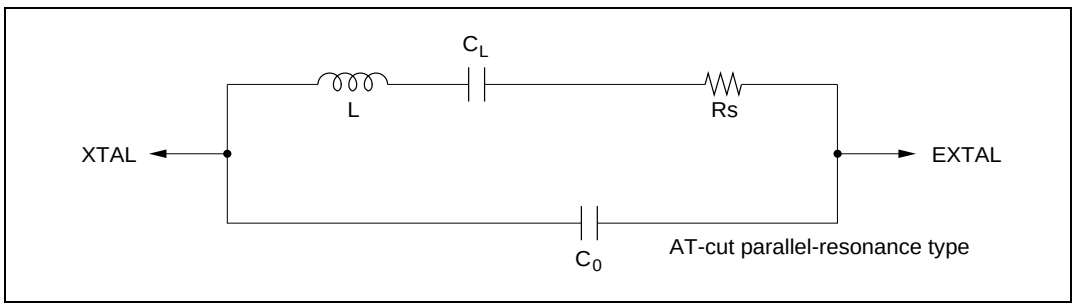

Figure 19.3 Crystal Resonator Equivalent Circuit

Table 19.2 Crystal Resonator Parameters

Frequency (MHz)	2	4	8	10	12	16	18	20	25
Rs max (Ω)	500	120	80	70	60	50	40	40	40
Co (pF)	7 pF max								

Use a crystal resonator with a frequency equal to the system clock frequency (ϕ).

Notes on Board Design: When a crystal resonator is connected, the following points should be noted:

Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation. See figure 19.4.

When the board is designed, the crystal resonator and its load capacitors should be placed as close as possible to the XTAL and EXTAL pins.

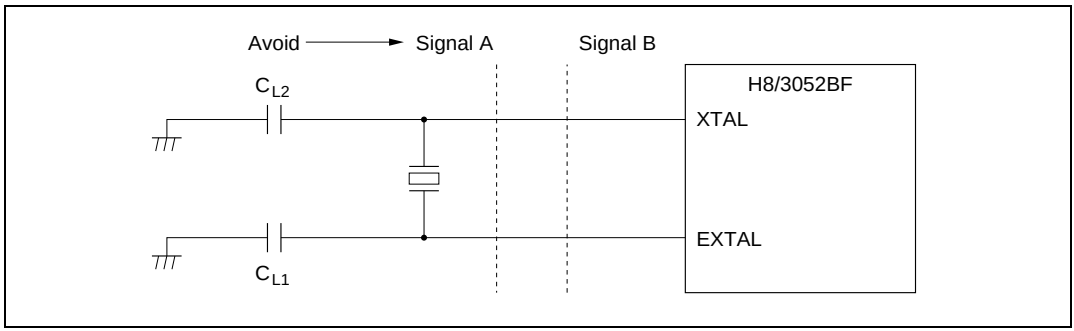

Figure 19.4 Example of Incorrect Board Design

19.2.2 External Clock Input

Circuit Configuration: An external clock signal can be input as shown in the examples in figure 19.5. If the XTAL pin is left open, the stray capacitance should not exceed 10 pF. If the stray capacitance at the XTAL pin exceeds 10 pF in configuration a, use configuration b instead and hold the clock high in standby mode.

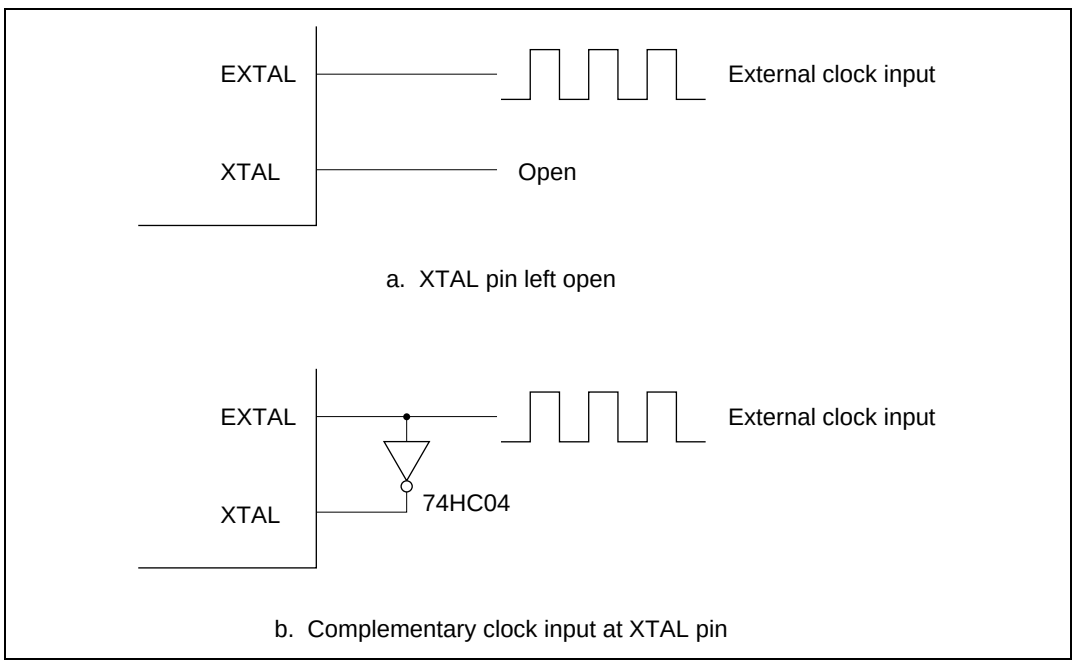

Figure 19.5 External Clock Input (Examples)

External Clock: The external clock frequency should be equal to the system clock frequency (ϕ) when not divided by the on-chip frequency divider. Table 19.3 shows the clock timing, and figure 19.6 shows the external clock input timing. Figure 19.7 shows the external clock output stabilization delay timing.

When the appropriate external clock is input via the EXTAL pin, its waveform is corrected by the on-chip oscillator and duty adjustment circuit. The resulting stable clock is output to external devices after the external clock settling time (t_{DEXT}) has passed after the clock input. The system must remain reset with the reset signal low during t_{DEXT}, while the clock output is unstable.

Table 19.3 Clock Timing

		V_{CC} = 5.0 V ± 10% V_{CC} = 3.0V to 3.6V			
Item	**Symbol**	**Min**	**Max**	**Unit**	**Test Conditions**
External clock input low pulse width	t_{EXL}	15	—	ns	Figure 19.6
External clock input high pulse width	t_{EXH}	15	—	ns	
External clock rise time	t_{EXr}	—	5	ns	
External clock fall time	t_{EXf}	—	5	ns	
Clock low pulse width	t_{CL}	0.4	0.6	t_{cyc}	ϕ ≥ 5 MHz Figure 21.4
		80	—	ns	ϕ < 5 MHz
Clock high pulse width	t_{CH}	0.4	0.6	t_{cyc}	ϕ ≥ 5 MHz
		80	—	ns	ϕ < 5 MHz
External clock output settling delay time	t_{DEXT}*	500	—	µs	Figure 19.7

Note: * t_{DEXT} includes 10 t_{cyc} of $\overline{RES}$ pulse width (t_{RESW}).

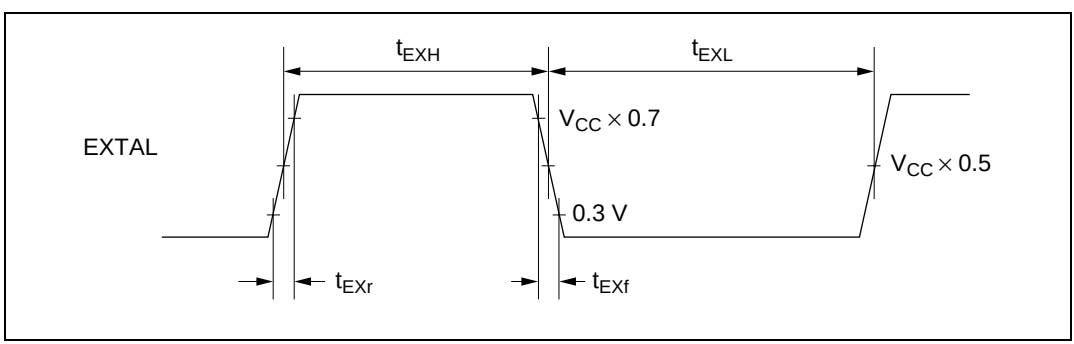

Figure 19.6 External Clock Input Timing

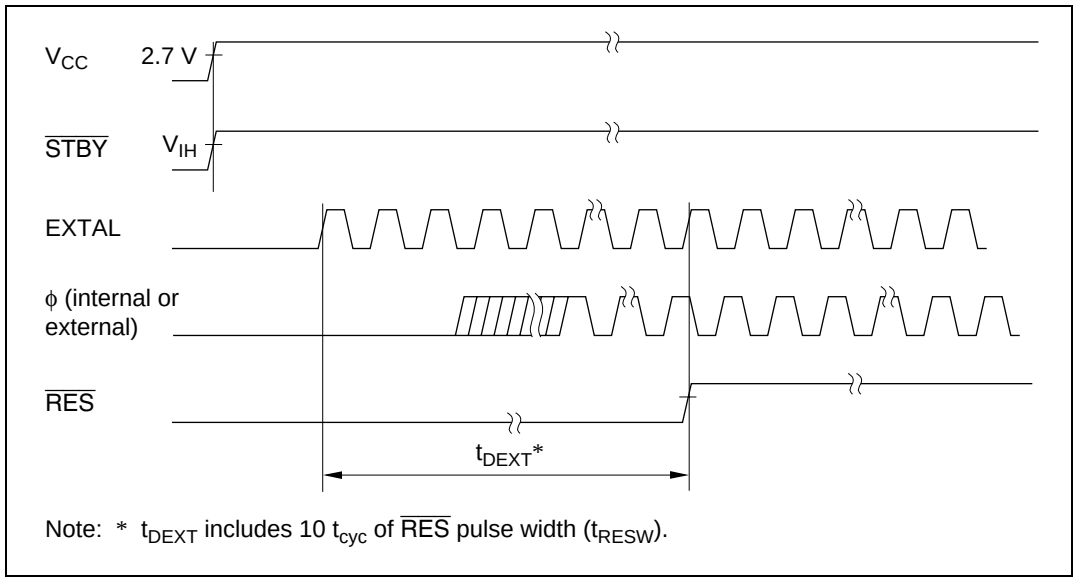

Figure 19.7 External Clock Output Settling Delay Timing

19.3 Duty Adjustment Circuit

When the oscillator frequency is 5 MHz or higher, the duty adjustment circuit adjusts the duty cycle of the clock signal from the oscillator to generate the signal that becomes the system clock.

19.4 Prescalers

The prescalers divide the system clock (ϕ) to generate internal clocks (ϕ/2 to ϕ/4096).

19.5 Frequency Divider

The frequency divider divides the duty-adjusted clock signal to generate the system clock (ϕ). The frequency division ratio can be changed dynamically by modifying the value in DIVCR, as described below. Power consumption in the chip is reduced in almost direct proportion to the frequency division ratio. The system clock generated by the frequency divider can be output at the ϕ pin.

19.5.1 Register Configuration

Table 19.4 summarizes the frequency division register.

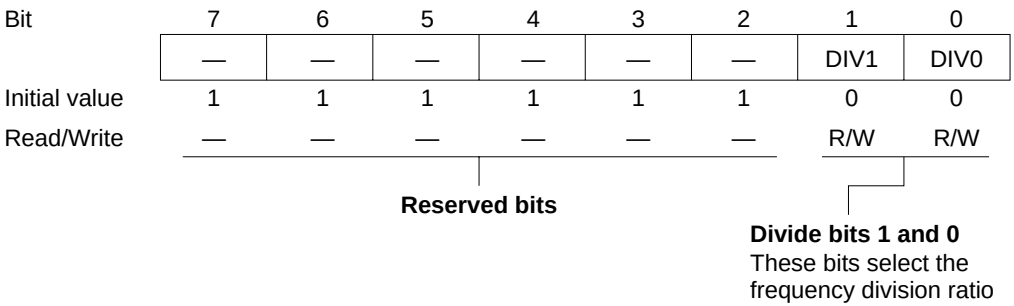
Table 19.4 Frequency Division Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FF5D	Division control register	DIVCR	R/W	H'FC

Note: * The lower 16 bits of the address are shown.

19.5.2 Division Control Register (DIVCR)

DIVCR is an 8-bit readable/writable register that selects the division ratio of the frequency divider.



DIVCR is initialized to H'FC by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 2—Reserved: Read-only bits, always read as 1.

Bits 1 and 0—Divide (DIV1 and DIV0): These bits select the frequency division ratio, as follows.

Bit 1: DIV1	Bit 0: DIV0	Frequency Division Ratio	
0	0	1/1	(Initial value)
	1	1/2	
1	0	1/4	
	1	1/8	

19.5.3 Usage Notes

The DIVCR setting changes the ϕ frequency, so note the following points.

- Select a frequency division ratio that stays within the assured operation range specified for the clock cycle time t_{cyc} in the AC electrical characteristics. Note that ϕ_{MIN} = 2 MHz. Avoid settings that give system clock frequencies less than 2 MHz.
- All on-chip module operations are based on ϕ. Note that the timing of timer operations, serial communication, and other time-dependent processing differs before and after any change in the division ratio. The waiting time for exit from software standby mode also changes when the division ratio is changed. For details, see section 20.4.3, Selection of Waiting Time for Exit from Software Standby Mode.

Section 20 Power-Down State

20.1 Overview

The H8/3052BF has a power-down state that greatly reduces power consumption by halting the CPU, and a module standby function that reduces power consumption by selectively halting on-chip modules.

The power-down state includes the following three modes:

- Sleep mode
- Software standby mode
- Hardware standby mode

The module standby function can halt on-chip supporting modules independently of the power-down state. The modules that can be halted are the ITU, SCI0, SCI1, DMAC, refresh controller, and A/D converter.

Table 20.1 indicates the methods of entering and exiting the power-down modes and module standby mode, and gives the status of the CPU and on-chip supporting modules in each mode.

Table 20.1 Power-Down State and Module Standby Function

Mode	Entering Conditions	State: Clock	CPU	CPU Registers	DMAC	Refresh Controller	ITU	SCI0	SCI1	A/D	Other Modules	RAM	φ Clock Output	I/O Ports	Exiting Conditions
Sleep mode	SLEEP instruction executed while SSBY = 0 in SYSCR	Active	Halted	Held	Active	Active	Active	Active	Active	Active	Active	Held	φ output	Held	• Interrupt • $\overline{\text{RES}}$ • $\overline{\text{STBY}}$
Software standby mode	SLEEP instruction executed while SSBY = 1 in SYSCR	Halted	Halted	Held	Halted and reset	Halted and held*1	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Held	High output	Held	• NMI • $\overline{\text{IRQ}}_0$ to $\overline{\text{IRQ}}_2$ • $\overline{\text{RES}}$ • $\overline{\text{STBY}}$
Hardware standby mode	Low input at $\overline{\text{STBY}}$ pin	Halted	Halted	Undeter-mined	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Halted and reset	Held*3	High impedance	High impedance	• $\overline{\text{STBY}}$ • $\overline{\text{RES}}$
Module standby	Corresponding bit set to 1 in MSTCR	Active	Active	—	Halted*2 and reset	Halted*2 and held*1	Halted*2 and reset	Halted*2 and reset	Halted*2 and reset	Halted*2 and reset	Active	—	High impedance*2	—	• $\overline{\text{STBY}}$ • $\overline{\text{RES}}$ • Clear MSTCR bit to 0*4

Notes: 1. RTCNT and bits 7 and 6 of RTMCSR are initialized. Other bits and registers hold their previous states.
2. State in which the corresponding MSTCR bit was set to 1. For details see section 20.2.2, Module Standby Control Register (MSTCR).
3. The RAME bit must be cleared to 0 in SYSCR before the transition from the program execution state to hardware standby mode.
4. When a MSTCR bit is set to 1, the registers of the corresponding on-chip supporting module are initialized. To restart the module, first clear the MSTCR bit to 0, then set up the module registers again.

Legend:
SYSCR: System control register
SSBY: Software standby bit
MSTCR: Module standby control register

20.2 Register Configuration

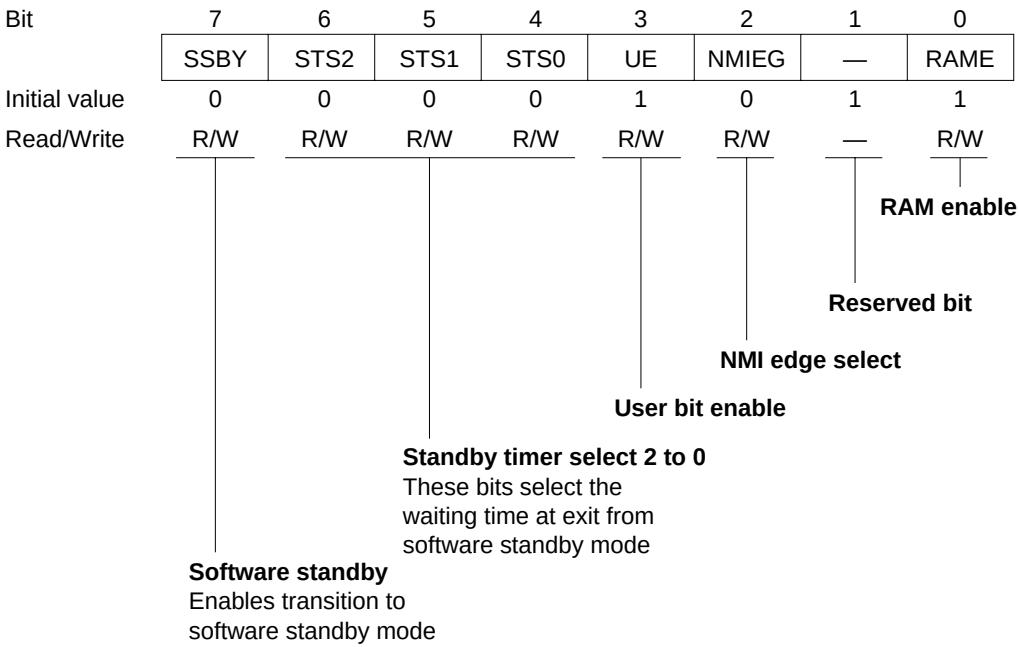
The H8/3052BF has a system control register (SYSCR) that controls the power-down state, and a module standby control register (MSTCR) that controls the module standby function. Table 20.2 summarizes these registers.

Table 20.2 Control Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B
H'FF5E	Module standby control register	MSTCR	R/W	H'40

Note: * Lower 16 bits of the address.

20.2.1 System Control Register (SYSCR)



SYSCR is an 8-bit readable/writable register. Bit 7 (SSBY) and bits 6 to 4 (STS2 to STS0) control the power-down state. For information on the other SYSCR bits, see section 3.3, System Control Register (SYSCR).

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. When software standby mode is exited by an external interrupt, this bit remains set to 1 after the return to normal operation. To clear this bit, write 0.

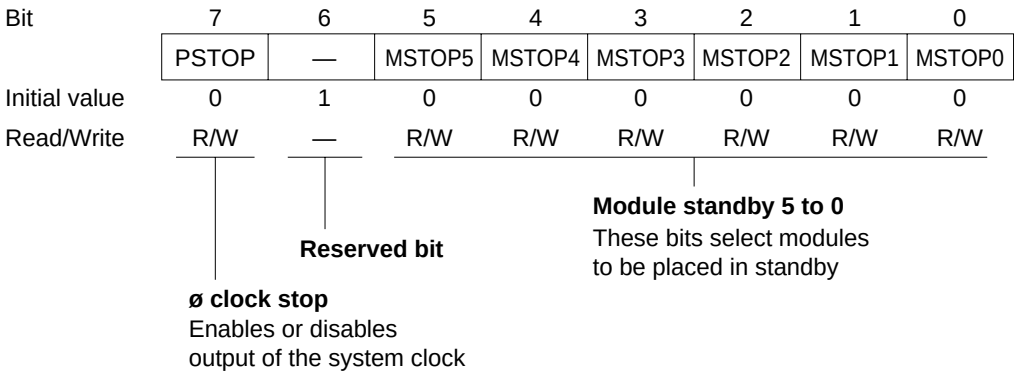
Bit 7: SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the clock to settle when software standby mode is exited by an external interrupt. If the clock is generated by a crystal resonator, set these bits according to the clock frequency so that the waiting time will be at least 7 ms. See table 20.3. If an external clock is used, Set these bits according to the operating frequency so that the waiting time will be at least 100 µs.

Bit 6: STS2	Bit 5: STS1	Bit 4: STS0	Description	
0	0	0	Waiting time = 8,192 states	(Initial value)
		1	Waiting time = 16,384 states	
	1	0	Waiting time = 32,768 states	
		1	Waiting time = 65,536 states	
1	0	0	Waiting time = 131,072 states	
		1	Waiting time = 1,024 states	
	1	—	Illegal setting	

20.2.2 Module Standby Control Register (MSTCR)

MSTCR is an 8-bit readable/writable register that controls output of the system clock (ϕ). It also controls the module standby function, which places individual on-chip supporting modules in the standby state. Module standby can be designated for the ITU, SCI0, SCI1, DMAC, refresh controller, and A/D converter modules.



MSTCR is initialized to H'40 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—ϕ Clock Stop (PSTOP): Enables or disables output of the system clock (ϕ).

Bit 7: PSTOP	Description	
0	System clock output is enabled	(Initial value)
1	System clock output is disabled	

Bit 6—Reserved: Read-only bit, always read as 1.

Bit 5—Module Standby 5 (MSTOP5): Selects whether to place the ITU in standby.

Bit 5: MSTOP5	Description	
0	ITU operates normally	(Initial value)
1	ITU is in standby state	

Bit 4—Module Standby 4 (MSTOP4): Selects whether to place SCI0 in standby.

Bit 4: MSTOP4	Description	
0	SCI0 operates normally	(Initial value)
1	SCI0 is in standby state	

Bit 3—Module Standby 3 (MSTOP3): Selects whether to place SCI1 in standby.

Bit 3: MSTOP3	Description	
0	SCI1 operates normally	(Initial value)
1	SCI1 is in standby state	

Bit 2—Module Standby 2 (MSTOP2): Selects whether to place the DMAC in standby.

Bit 2: MSTOP2	Description	
0	DMAC operates normally	(Initial value)
1	DMAC is in standby state	

Bit 1—Module Standby 1 (MSTOP1): Selects whether to place the refresh controller in standby.

Bit 1: MSTOP1	Description	
0	Refresh controller operates normally	(Initial value)
1	Refresh controller is in standby state	

Bit 0—Module Standby 0 (MSTOP0): Selects whether to place the A/D converter in standby.

Bit 0: MSTOP0	Description	
0	A/D converter operates normally	(Initial value)
1	A/D converter is in standby state	

20.3 Sleep Mode

20.3.1 Transition to Sleep Mode

When the SSBY bit is cleared to 0 in SYSCR, execution of the SLEEP instruction causes a transition from the program execution state to sleep mode. Immediately after executing the SLEEP instruction the CPU halts, but the contents of its internal registers are retained. The DMA controller (DMAC), refresh controller, and on-chip supporting modules do not halt in sleep mode. Modules which have been placed in standby by the module standby function, however, remain halted.

20.3.2 Exit from Sleep Mode

Sleep mode is exited by an interrupt, or by input at the $\overline{\text{RES}}$ or $\overline{\text{STBY}}$ pin.

Exit by Interrupt: An interrupt terminates sleep mode and causes a transition to the interrupt exception handling state. Sleep mode is not exited by an interrupt source in an on-chip supporting module if the interrupt is disabled in the on-chip supporting module. Sleep mode is not exited by an interrupt other than NMI if the interrupt is masked by the I and UI bits in CCR and IPR.

Exit by $\overline{\text{RES}}$ Input: Low input at the $\overline{\text{RES}}$ pin exits from sleep mode to the reset state.

Exit by $\overline{\text{STBY}}$ Input: Low input at the $\overline{\text{STBY}}$ pin exits from sleep mode to hardware standby mode.

20.4 Software Standby Mode

20.4.1 Transition to Software Standby Mode

To enter software standby mode, execute the SLEEP instruction while the SSBY bit is set to 1 in SYSCR.

In software standby mode, current dissipation is reduced to an extremely low level because the CPU, clock, and on-chip supporting modules all halt. The DMAC and on-chip supporting modules are reset. As long as the specified voltage is supplied, however, CPU register contents and on-chip RAM data are retained. The settings of the I/O ports and refresh controller* are also held.

Note: * RTCNT and bits 7 and 6 of RTMCSR are initialized. Other bits and registers hold their previous states.

20.4.2 Exit from Software Standby Mode

Software standby mode can be exited by input of an external interrupt at the NMI, $\overline{IRQ_0}$, $\overline{IRQ_1}$, or $\overline{IRQ_2}$ pin, or by input at the $\overline{RES}$ or $\overline{STBY}$ pin.

Exit by Interrupt: When an NMI, IRQ_0, IRQ_1, or IRQ_2 interrupt request signal is received, the clock oscillator begins operating. After the oscillator settling time selected by bits STS2 to STS0 in SYSCR, stable clock signals are supplied to the entire chip, software standby mode ends, and interrupt exception handling begins. Software standby mode is not exited if the interrupt enable bits of interrupts IRQ_0, IRQ_1, and IRQ_2 are cleared to 0, or if these interrupts are masked in the CPU.

Exit by $\overline{RES}$ Input: When the $\overline{RES}$ input goes low, the clock oscillator starts and clock pulses are supplied immediately to the entire chip. The $\overline{RES}$ signal must be held low long enough for the clock oscillator to stabilize. When $\overline{RES}$ goes high, the CPU starts reset exception handling.

Exit by $\overline{STBY}$ Input: Low input at the $\overline{STBY}$ pin causes a transition to hardware standby mode.

20.4.3 Selection of Waiting Time for Exit from Software Standby Mode

Bits STS2 to STS0 in SYSCR and bits DIV1 and DIV0 in DIVCR should be set as follows.

Crystal Resonator: Set STS2 to STS0, DIV1, and DIV0 so that the waiting time (for the clock to stabilize) is at least 7 ms. Table 20.3 indicates the waiting times that are selected by STS2 to STS0, DIV1, and DIV0 settings at various system clock frequencies.

External Clock: Set STS2 to STS0, DIV0, and DIV1 so that the waiting time is at least 100 µs.

Table 20.3 Clock Frequency and Waiting Time for Clock to Settle

DIV1	DIV0	STS2	STS1	STS0	Waiting Time	18 MHz	16 MHz	12 MHz	10 MHz	8 MHz	6 MHz	4 MHz	2 MHz	1 MHz	Unit
0	0	0	0	0	8192 states	0.46	0.51	0.65	0.8	1.0	1.3	2.0	4.1	**8.2**	ms

Bold face is recommended setting

20.4.4 Sample Application of Software Standby Mode

Figure 20.1 shows an example in which software standby mode is entered at the fall of NMI and exited at the rise of NMI.

With the NMI edge select bit (NMIEG) cleared to 0 in SYSCR (selecting the falling edge), an NMI interrupt occurs. Next the NMIEG bit is set to 1 (selecting the rising edge) and the SSBY bit is set to 1; then the SLEEP instruction is executed to enter software standby mode.

Software standby mode is exited at the next rising edge of the NMI signal.

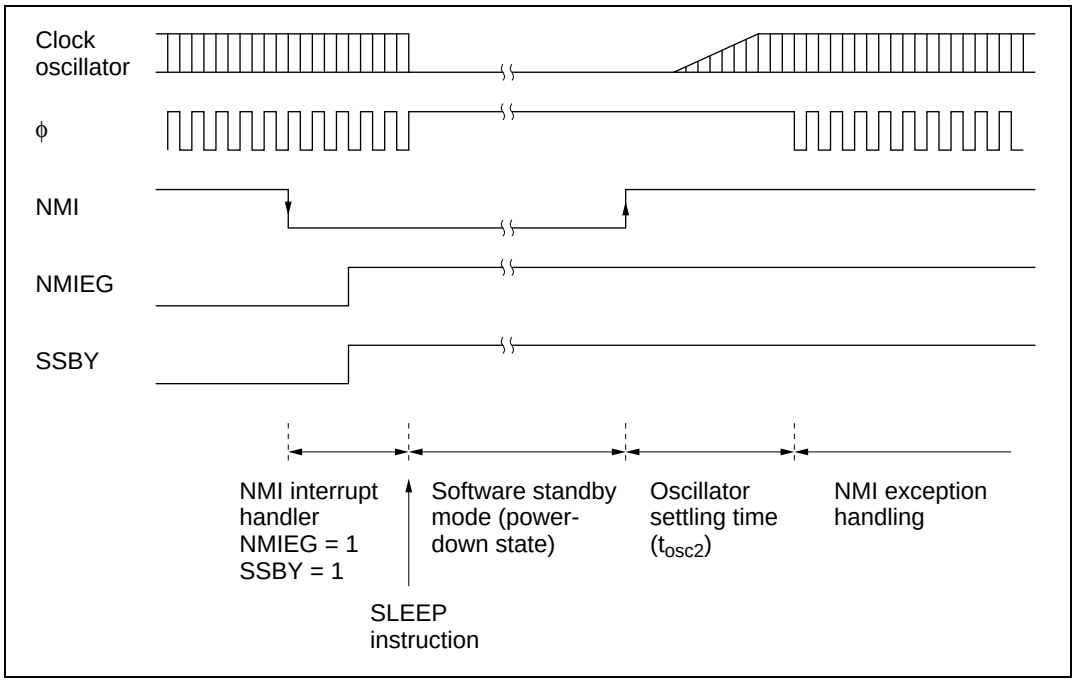

Figure 20.1 NMI Timing for Software Standby Mode (Example)

20.4.5 Note

The I/O ports retain their existing states in software standby mode. If a port is in the high output state, its output current is not reduced.

20.5 Hardware Standby Mode

20.5.1 Transition to Hardware Standby Mode

Regardless of its current state, the chip enters hardware standby mode whenever the $\overline{\text{STBY}}$ pin goes low. Hardware standby mode reduces power consumption drastically by halting all functions of the CPU, DMAC, refresh controller, and on-chip supporting modules. All modules are reset except the on-chip RAM. As long as the specified voltage is supplied, on-chip RAM data is retained. I/O ports are placed in the high-impedance state.

Clear the RAME bit to 0 in SYSCR before $\overline{\text{STBY}}$ goes low to retain on-chip RAM data.

The inputs at the mode pins (MD_2 to MD_0) should not be changed during hardware standby mode.

20.5.2 Exit from Hardware Standby Mode

Hardware standby mode is exited by inputs at the $\overline{\text{STBY}}$ and $\overline{\text{RES}}$ pins. While $\overline{\text{RES}}$ is low, when $\overline{\text{STBY}}$ goes high, the clock oscillator starts running. $\overline{\text{RES}}$ should be held low long enough for the clock oscillator to settle. When $\overline{\text{RES}}$ goes high, reset exception handling begins, followed by a transition to the program execution state.

20.5.3 Timing for Hardware Standby Mode

Figure 20.2 shows the timing relationships for hardware standby mode. To enter hardware standby mode, first drive $\overline{\text{RES}}$ low, then drive $\overline{\text{STBY}}$ low. To exit hardware standby mode, first drive $\overline{\text{STBY}}$ high, wait for the clock to settle, then bring $\overline{\text{RES}}$ from low to high.

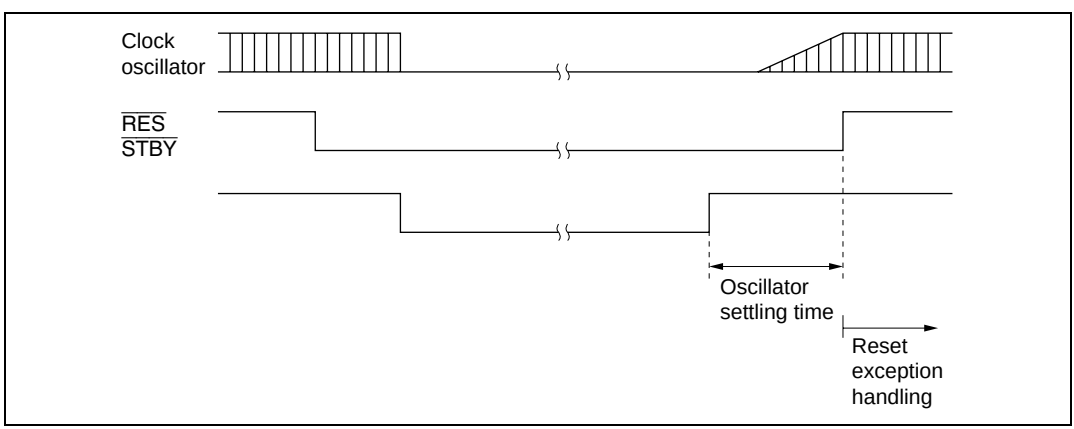

Figure 20.2 Hardware Standby Mode Timing

20.6 Module Standby Function

20.6.1 Module Standby Timing

The module standby function can halt several of the on-chip supporting modules (the ITU, SCI0, SCI1, DMAC, refresh controller, and A/D converter) independently of the power-down state. This standby function is controlled by bits MSTOP5 to MSTOP0 in MSTCR. When one of these bits is set to 1, the corresponding on-chip supporting module is placed in standby and halts at the beginning of the next bus cycle after the MSTCR write cycle.

20.6.2 Read/Write in Module Standby

When an on-chip supporting module is in module standby, read/write access to its registers is disabled. Read access always results in H'FF data. Write access is ignored.

20.6.3 Usage Notes

When using the module standby function, note the following points.

DMAC and Refresh Controller: When setting bit MSTOP2 or MSTOP1 to 1 to place the DMAC or refresh controller in module standby, make sure that the DMAC or refresh controller is not currently requesting the bus right. If bit MSTOP2 or MSTOP1 is set to 1 when a bus request is present, operation of the bus arbiter becomes ambiguous and a malfunction may occur.

Internal Peripheral Module Interrupt: When MSTCR is set to “1”, prevent module interrupt in advance. When an on-chip supporting module is placed in standby by the module standby function, its registers are initialized.

Pin States: Pins used by an on-chip supporting module lose their module functions when the module is placed in module standby. What happens after that depends on the particular pin. For details, see section 9, I/O Ports. Pins that change from the input to the output state require special care. For example, if SCI1 is placed in module standby, the receive data pin loses its receive data function and becomes a generic I/O pin. If its data direction bit is set to 1, the pin becomes a data output pin, and its output may collide with external serial data. Data collisions should be prevented by clearing the data direction bit to 0 or taking other appropriate action.

Register Resetting: When an on-chip supporting module is halted by the module standby function, all its registers are initialized. To restart the module, after its MSTOP bit is cleared to 0, its registers must be set up again. It is not possible to write to the registers while the MSTOP bit is set to 1.

MSTCR Access from DMAC Disabled: To prevent malfunctions, MSTCR can only be accessed from the CPU. It can be read by the DMAC, but it cannot be written by the DMAC.

20.7 System Clock Output Disabling Function

Output of the system clock (ϕ) can be controlled by the PSTOP bit in MSTCR. When the PSTOP bit is set to 1, output of the system clock halts and the ϕ pin is placed in the high-impedance state. Figure 20.3 shows the timing of the stopping and starting of system clock output. When the PSTOP bit is cleared to 0, output of the system clock is enabled. Table 20.4 indicates the state of the ϕ pin in various operating states.

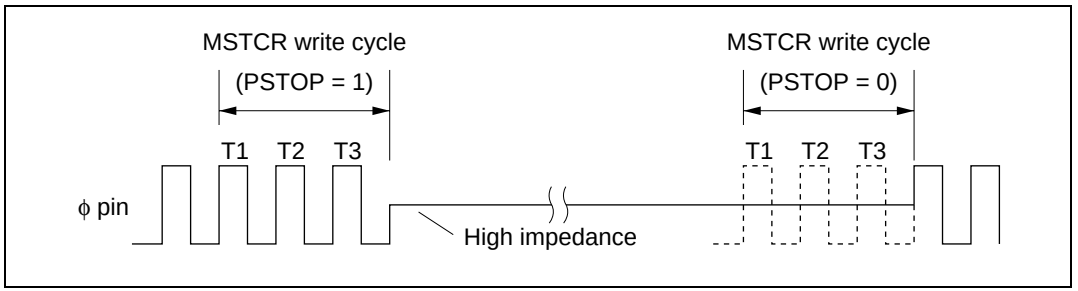

Figure 20.3 Starting and Stopping of System Clock Output

Table 20.4 ϕ Pin State in Various Operating States

Operating State	PSTOP = 0	PSTOP = 1
Hardware standby	High impedance	High impedance
Software standby	Always high	High impedance
Sleep mode	System clock output	High impedance
Normal operation	System clock output	High impedance

Section 21 Electrical Characteristics

21.1 Absolute Maximum Ratings

Table 21.1 lists the absolute maximum ratings.

Table 21.1 Absolute Maximum Ratings

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}	–0.3 to +7.0	V
Programming voltage HD64F3052B (FWE)	V_{in}	–0.3 to V_{CC} + 0.3	V
Input voltage (except for port 7)	V_{in}	–0.3 to V_{CC} + 0.3	V
Input voltage (port 7)	V_{in}	–0.3 to AV_{CC} + 0.3	V
Reference voltage	V_{REF}	–0.3 to AV_{CC} + 0.3	V
Analog power supply voltage	AV_{CC}	–0.3 to +7.0	V
Analog input voltage	V_{AN}	–0.3 to AV_{CC} + 0.3	V
Operating temperature	T_{opr}	–20 to +75*	°C
Storage temperature	T_{stg}	–55 to +125	°C

Notes: Connect an external capacitor to the V_{CL} pin. Connect an external capacitor between this pin and ground.

* For flash memory program/erase operations, the operating temperature range is T_a = 0 to +75°C.

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

21.2 Electrical Characteristics

21.2.1 DC Characteristics

Table 21.2 lists the DC characteristics. Table 21.3 lists the permissible output currents.

Table 21.2 DC Characteristics

Conditions: V_{CC} = 5.0 V ±10%, AV_{CC} = 5.0 V ±10%, V_{REF} = 4.5 V to AV_{CC},
V_{SS} = AV_{SS} = 0 V*1, T_a = –20°C to +75°C

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Schmitt trigger input voltages	Port A, $P8_0$ to $P8_2$, PB_0 to PB_3	V_T^-	1.0	—	—	V	
		V_T^+	—	—	$V_{CC} \times 0.7$	V	
		$V_T^+ - V_T^-$	0.4	—	—	V

	NMI, EXTAL, ports 1, 2, 3, 4, 5, 6, 7, 9, $P8_3$, $P8_4$, PB_4 to PB_7		–0.3	—	0.8	V	
Output high voltage	All output pins	V_{OH}	V_{CC} – 0.5	—	—	V	I_{OH} = –200 µA
			3.5	—	—	V	I_{OH} = –1 mA
Output low voltage	All output pins	V_{OL}	—	—	0.4	V	I_{OL} = 1.6 mA
	Ports 1, 2, 5, and B		—	—	1.0	V	I_{OL} = 10 mA

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Input leakage current	$\overline{STBY}$, NMI, $\overline{RES}$, FWE, MD_2 to MD_0	$\|I_{in}\|$	—	—	1.0	µA	V_{in} = 0.5 to V_{CC} – 0.5 V
	Port 7		—	—	1.0	µA	V_{in} = 0.5 to AV_{CC} – 0.5 V
Three-state leakage current (off state)	Ports 1, 2, 3, 4, 5, 6, 8 to B	$\|I_{TSI}\|$	—	—	1.0	µA	V_{in} = 0.5 to V_{CC} – 0.5 V
Input pull-up current	Ports 2, 4, and 5	$-I_P$	50	—	300	µA	V_{in} = 0 V
Input capacitance	FWE	C_{in}	—	—	60	pF	V_{IN} = 0 V
	NMI		—	—	50	pF	f = 1 MHz
	All input pins except NMI		—	—	15	pF	T_a = 25°C
Current dissipation*2	Normal operation	I_{CC}	—	25	48	mA	f = 18 MHz
			—	35	60	mA	f = 25 MHz
	Sleep mode		—	23	38	mA	f = 18 MHz
			—	33	50	mA	f = 25 MHz
	Module standby mode*4		—	18	25	mA	f = 18 MHz
			—	25	40	mA	f = 25 MHz
	Standby mode*3		—	1.0	10	µA	$T_a \leq 50°C$
			—	—	80	µA	50°C < T_a
	Flash programming / erasing		—	35	58	mA	f = 18 MHz
			—	45	70	mA	f = 25 MHz
Analog power supply current	During A/D conversion	AI_{CC}	—	0.5	1.5	mA	
	During A/D and D/A conversion		—	0.5	1.5	mA	
	Idle		—	0.01	5.0	µA	DASTE = 0

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Reference current	During A/D conversion	AI_{CC}	—	0.4	0.8	mA	V_{REF} = 5.0 V
	During A/D and D/A conversion		—	1.5	3.0	mA	
	Idle		—	0.01	5.0	µA	DASTE = 0
RAM standby voltage		V_{RAM}	2.0	—	—	V	

Notes: 1. If the A/D and D/A converters are not used, do not leave the AV_{CC}, AV_{SS}, and V_{REF} pins open. Connect AV_{CC} and V_{REF} to V_{CC}, and connect AV_{SS} to V_{SS}.

2. Current dissipation values are for V_{IH}min = V_{CC} – 0.5 V and V_{IL}max = 0.5 V with all output pins unloaded and the on-chip pull-up transistors in the off state.

I_{CC} max.(under normal operations) = 3.0 (mA) + 0.45 (mA/(MHz × V)) × V_{CC} × f

I_{CC} max.(when using the sleeve) = 3.0 (mA) + 0.35 (mA/(MHz × V)) × V_{CC} × f

I_{CC} max.(when the sleeve + module are standing by)

= 3.0 (mA) + 0.26 (mA/(MHz × V)) × V_{CC} × f

Also,the typ.values for current dissipation are reference values.

3. The values are for $V_{RAM} \leq V_{CC} < 4.5$ V, V_{IH}min = V_{CC} × 0.9, and V_{IL}max = 0.3 V.
4. Module standby current values apply in sleep mode with all modules halted.

Table 21.3 Permissible Output Currents

Conditions: V_{CC} = 5.0 V ±10%, AV_{CC} = 5.0 V ±10%, V_{REF} = 4.5 V to AV_{CC}, V_{SS} = AV_{SS} = 0 V, T_a = –20°C to +75°C

Item		Symbol	Min	Typ	Max	Unit
Permissible output low current (per pin)	Ports 1, 2, 5, and B	I_{OL}	—	—	10	mA
	Other output pins		—	—	2.0	mA
Permissible output low current (total)	Total of 28 pins in ports 1, 2, 5, and B	ΣI_{OL}	—	—	80	mA
	Total of all output pins, including the above		—	—	120	mA
Permissible output high current (per pin)	All output pins	I_{OH}	—	—	2.0	mA
Permissible output high current (total)	Total of all output pins	ΣI_{OH}	—	—	40	mA

Notes: 1. To protect chip reliability, do not exceed the output current values in table 21.3.

2. When driving a darlington pair or LED, always insert a current-limiting resistor in the output line, as shown in figures 21.1 and 21.2.

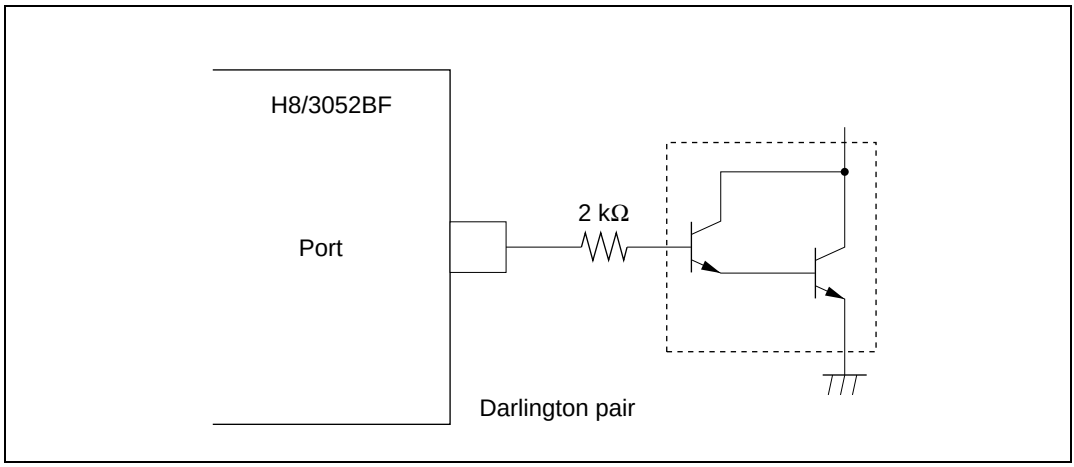

Figure 21.1 Darlington Pair Drive Circuit (Example)

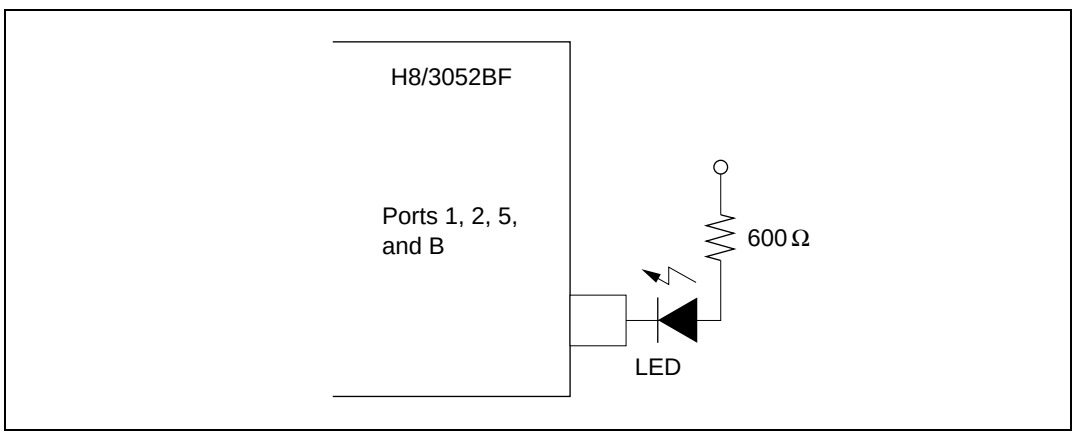

Figure 21.2 LED Drive Circuit (Example)

21.2.2 AC Characteristics

Bus timing parameters are listed in table 21.4. Refresh controller bus timing parameters are listed in table 21.5. Control signal timing parameters are listed in table 21.6. Timing parameters of the on-chip supporting modules are listed in table 21.7.

Table 21.4 Bus Timing

Conditions: V_{CC} = 5.0 V ±10%, AV_{CC} = 5.0 V ±10%, V_{REF} = 4.5 V to AV_{CC},

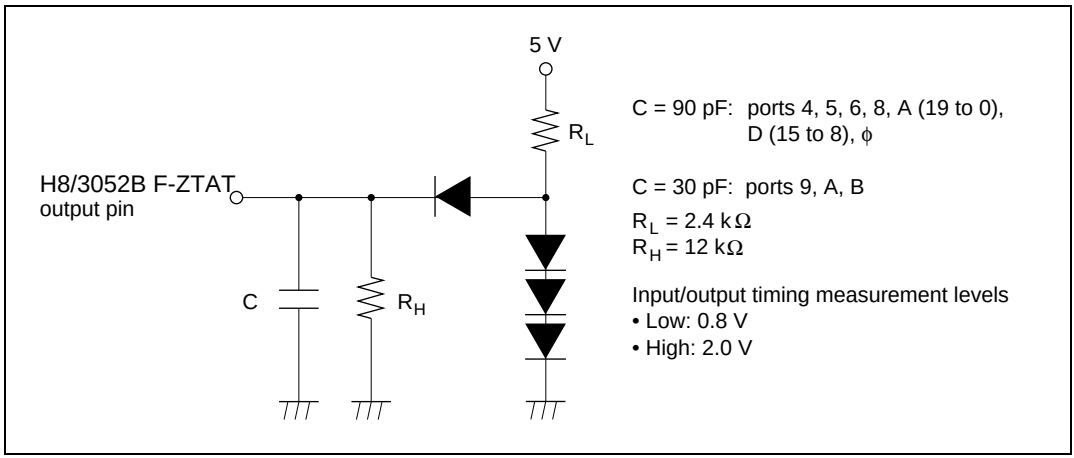

Figure 21.3 Output Load Circuit

21.2.3 A/D Conversion Characteristics

Table 21.8 lists the A/D conversion characteristics.

Table 21.8 A/D Converter Characteristics

Conditions: V_{CC} = 5.0 V ±10%, AV_{CC} = 5.0 V ±10%, V_{REF} = 4.5 V to AV_{CC}, V_{SS} = AV_{SS} = 0 V, ϕ = 2 MHz to 25 MHz, T_a = –20°C to +75°C

	Conditions			
Item	**Min**	**Typ**	**Max**	**Unit**
Resolution	10	10	10	bits
Conversion time	5.36	—	—	µs
Analog input capacitance	—	—	20	pF
Permissible signal-source impedance	—	—	10*1	kΩ
	—	—	5*2	
Nonlinearity error	—	—	±3.5	LSB
Offset error	—	—	±3.5	LSB
Full-scale error	—	—	±3.5	LSB
Quantization error	—	—	±0.5	LSB
Absolute accuracy	—	—	±4.0	LSB

Notes: 1 The value is for ϕ ≤ 13 MHz.
2 The value is for ϕ > 13 MHz.

21.2.4 D/A Conversion Characteristics

Table 21.9 lists the D/A conversion characteristics.

Table 21.9 D/A Converter Characteristics

Conditions: V_{CC} = 5.0 V ±10%, AV_{CC} = 5.0 V ±10%, V_{REF} = 4.5 V to AV_{CC},
V_{SS} = AV_{SS} = 0 V, ϕ = 2 MHz to 25 MHz, T_a = –20°C to +75°C

	Conditions				
Item	**Min**	**Typ**	**Max**	**Unit**	**Test Conditions**
Resolution	8	8	8	Bits	
Conversion time	—	—	10	µs	20-pF capacitive load
Absolute accuracy	—	±1.5	±2.0	LSB	2-MΩ resistive load
	—	—	±1.5	LSB	4-MΩ resistive load

21.2.5 Flash Memory Characteristics

Table 21.10 Flash Memory Characteristics

Conditions: V_{CC} = 4.5 V to 5.5 V, AV_{CC} = 4.5 V to 5.5 V, V_{SS} = AV_{SS} = 0 V, T_a = 0°C to +75°C (program/erase operating temperature range)

			Conditions				
Item		**Symbol**	**Min**	**Typ**	**Max**	**Unit**	**Notes**
Programming time*1*2*4		t_P	—	10	200	ms/128 bytes	
Erase time*1*3*5		t_E	—	100	1200	ms/block	
Reprogramming count		N_{WEC}	100*6	10.000*7	—	Times	
Data retention period		T_{DRP}	10*8	—	—	Years	
Programming	Wait time after SWE bit setting*1	tsswe	1	1	—	µs	
	Wait time after PSU bit setting*1	tspsu	50	50	—	µs	
	Wait time after P bit setting*1*4	tsp30	28	30	32	µs	Programming time wait
		tsp200	198	200	202	µs	Programming time wait
		tsp10	8	10	12	µs	Additional programming time wait
	Wait time after P bit clear*1	tcp	5	5	—	µs	
	Wait time after PSU bit clear*1	tcpsu	5	5	—	µs	
	Wait time after PV bit setting*1	tspv	4	4	—	µs	
	Wait time after H'FF dummy write*1	tspvr	2	2	—	µs	
	Wait time after PV bit clear*1	tcpv	2	2	—	µs	
	Wait time after SWE bit clear*1	tcswe	100	100	—	µs	
	Maximum programming count*1*4	N	—	—	1000	Times	
Erase	Wait time after SWE bit setting*1	tsswe	1	1	—	µs	
	Wait time after ESU bit setting*1	tsesu	100	100	—	µs	
	Wait time after E bit setting*1*5	tse	10	10	100	ms	Erase time wait
	Wait time after E bit clear*1	tce	10	10	—	µs	
	Wait time after ESU bit clear*1	tcesu	10	10	—	µs	
	Wait time after EV bit setting*1	tsev	20	20	—	µs	
	Wait time after H'FF dummy write*1	tsevr	2	2	—	µs	
	Wait time after EV bit clear*1	tcev	4	4	—	µs	
	Wait time after SWE bit clear*1	tcswe	100	100	—	µs	
	Maximum erase count*1*5	N	12	—	120	Times	

Notes: 1. Set the times according to the program/erase algorithms.
2. Programming time per 128 bytes. (Shows the total time the P1 bit or P2 bit in the flash memory control register (FLMCR1 or FLMCR2) is set. It does not include the programming verification time.)
3. Block erase time. (Shows the total time the E1 bit in FLMCR1 or E2 bit in FLMCR2 is set. It does not include the erase verification time.)
4. To specify the maximum programming time value (t_P(max)) in the 128-byte programming algorithm, set the max. value (1000) for the maximum programming count (N).
   The wait time after P bit setting should be changed as follows according to the value of the programming counter (n).
   Programming counter (n) = 1 to 6: tsp30 = 30 µs
   Programming counter (n) = 7 to 1000: tsp200 = 200 µs
   Programming counter (n) [in additional programming] = 1 to 6: tsp10 = 10 µs
5. For the maximum erase time (t_E(max)), the following relationship applies between the wait time after E bit setting (tse) and the maximum erase count (N):
   t_E(max) = Wait time after E bit setting (tse) × maximum erase count (N)
   To set the maximum erase time, the values of tse and N should be set so as to satisfy the above formula.
   Examples: When tse = 100 [ms], N = 12
   When tse = 10 [ms], N = 120
6. Minimum cycle value which guarantees all characteristics after reprogramming. (Reprogram cycles from 1 to minimum value are guaranteed.)
7. Reference characteristics at 25°C. (This is a indication that reprogram operation can normally function up to this figure.)
8. Data retention characteristics when reprogaram performed correctly within specification value including minimum data retention period.

21.3 Operational Timing

This section shows timing diagrams.

21.3.1 Bus Timing

Bus timing is shown as follows:

- Basic bus cycle: two-state access
  Figure 21.4 shows the timing of the external two-state access cycle.
- Basic bus cycle: three-state access
  Figure 21.5 shows the timing of the external three-state access cycle.

- Basic bus cycle: three-state access with one wait state

  Figure 21.6 shows the timing of the external three-state access cycle with one wait state inserted.

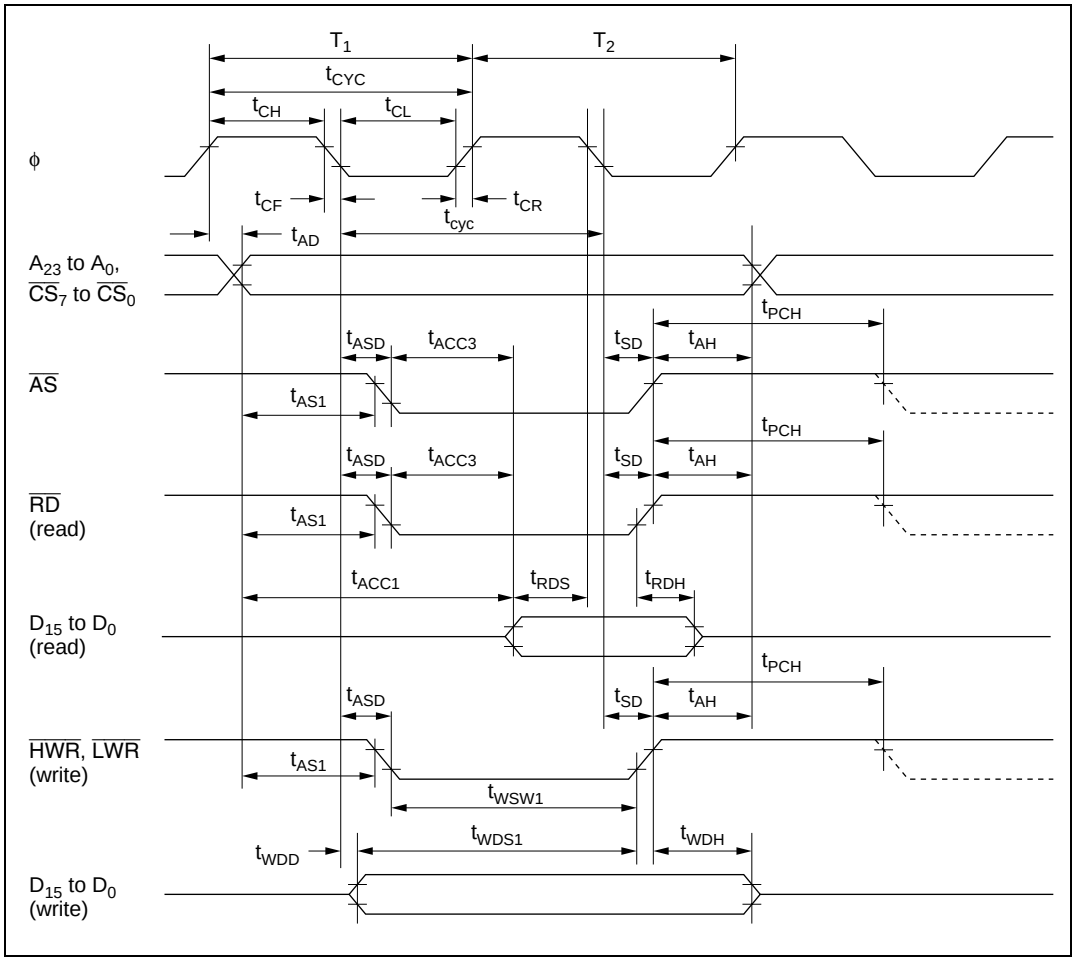

Figure 21.4 Basic Bus Cycle: Two-State Access

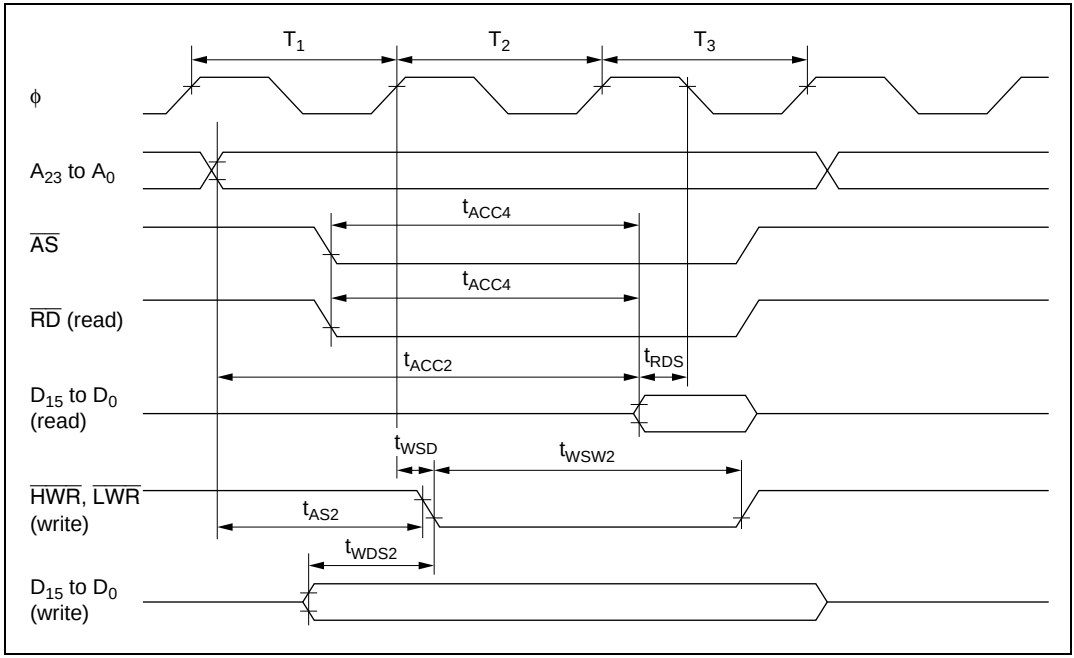

Figure 21.5 Basic Bus Cycle: Three-State Access

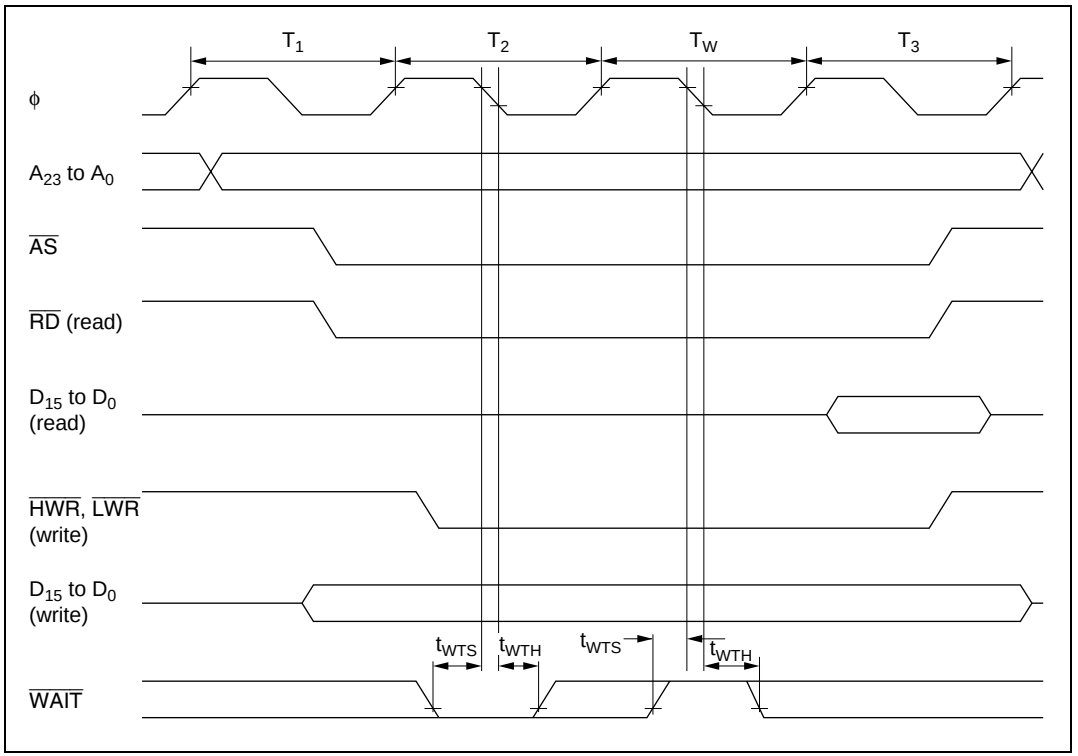

Figure 21.6 Basic Bus Cycle: Three-State Access with One Wait State

21.3.2 Refresh Controller Bus Timing

Refresh controller bus timing is shown as follows:

- DRAM bus timing
  Figures 21.7 to 21.12 show the DRAM bus timing in each operating mode.
- PSRAM bus timing
  Figures 21.13 and 21.14 show the pseudo-static RAM bus timing in each operating mode.

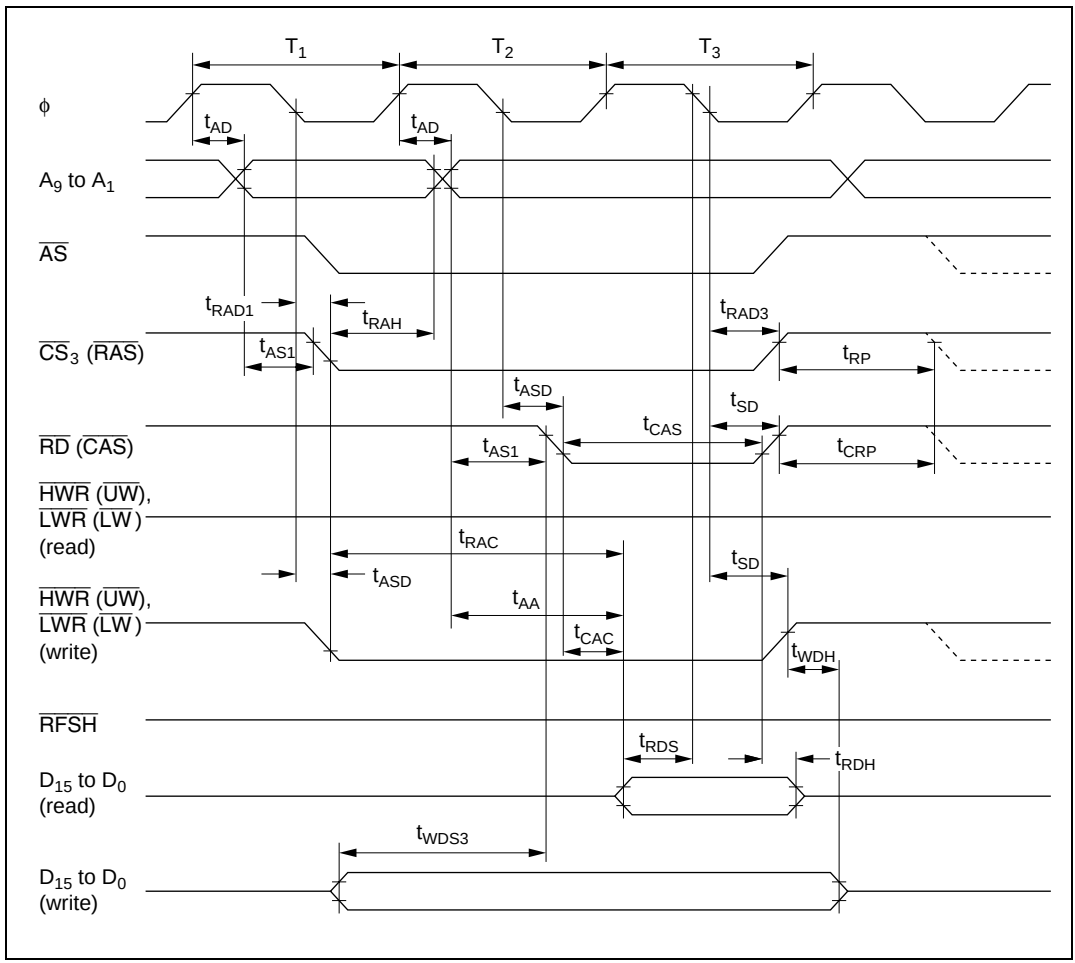

Figure 21.7 DRAM Bus Timing (Read/Write): Three-State Access
— 2$\overline{\text{WE}}$ Mode —

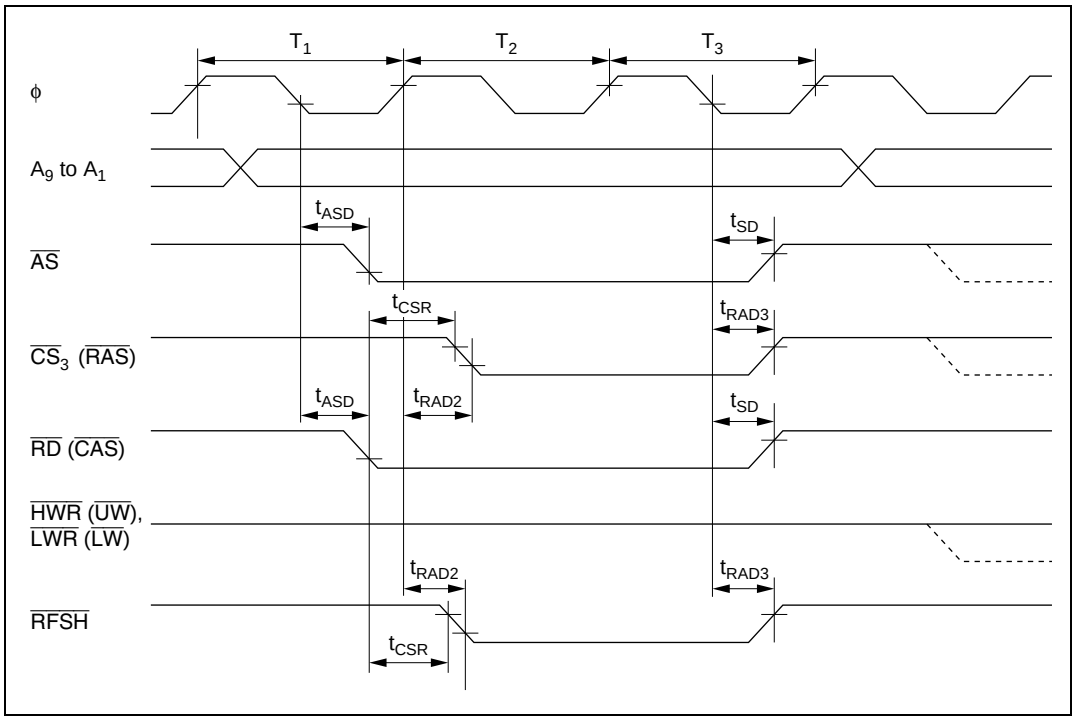

Figure 21.8 DRAM Bus Timing (Refresh Cycle): Three-State Access
— 2$\overline{\text{WE}}$ Mode —

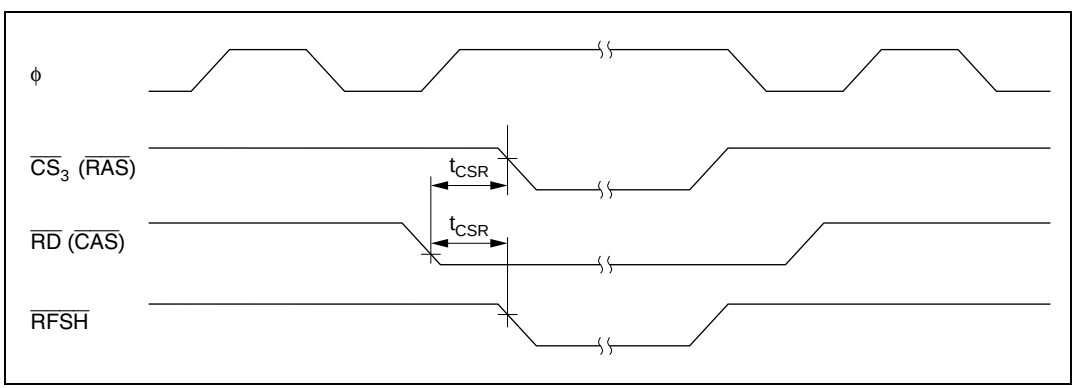

Figure 21.9 DRAM Bus Timing (Self-Refresh Mode)
— 2 $\overline{\text{WE}}$ Mode —

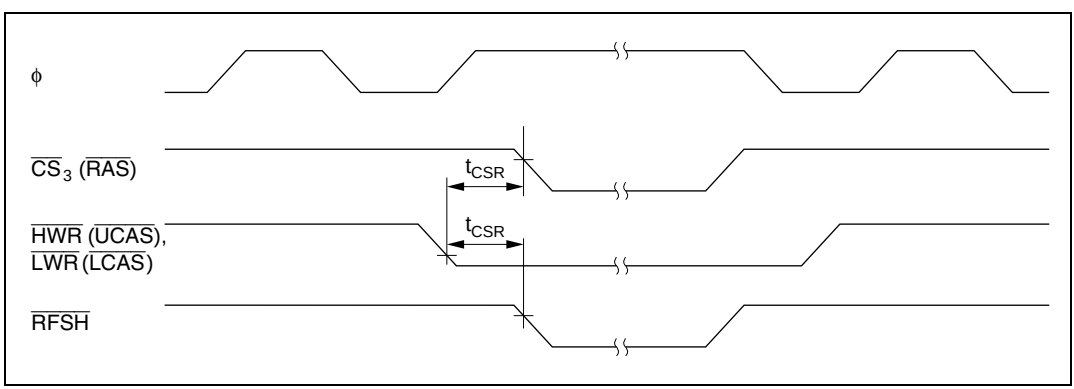

Figure 21.12 DRAM Bus Timing (Self-Refresh Mode) — 2 CAS Mode —

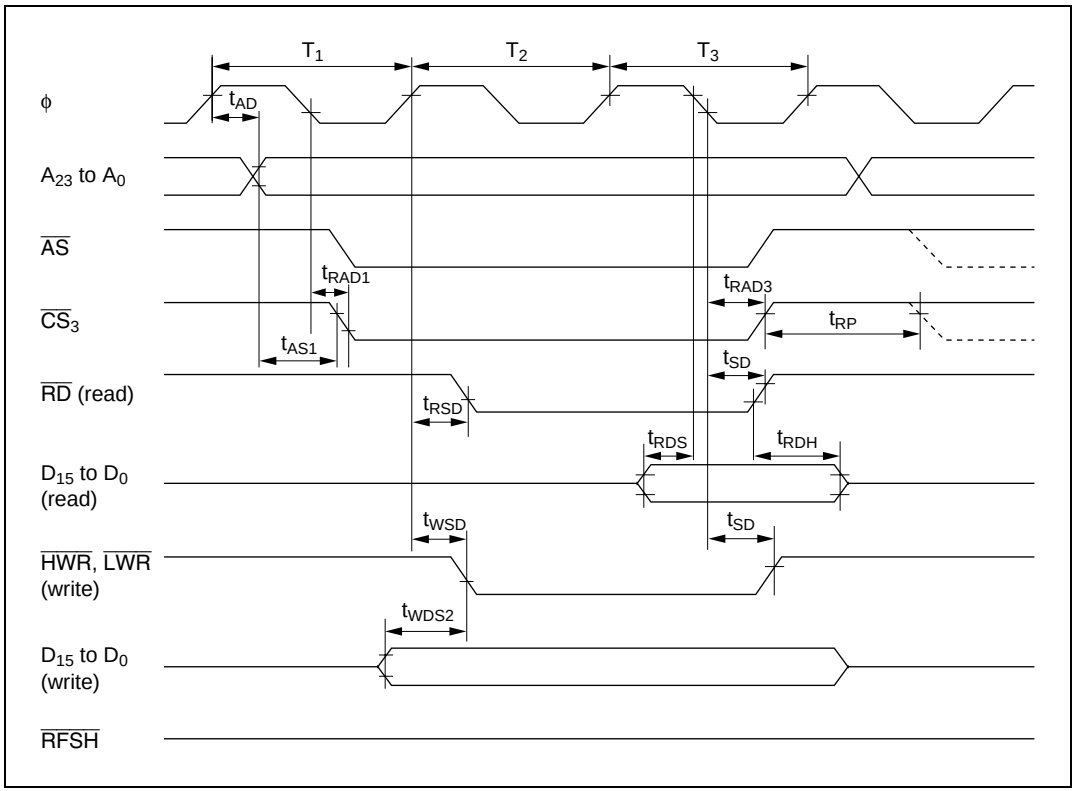

Figure 21.13 PSRAM Bus Timing (Read/Write): Three-State Access

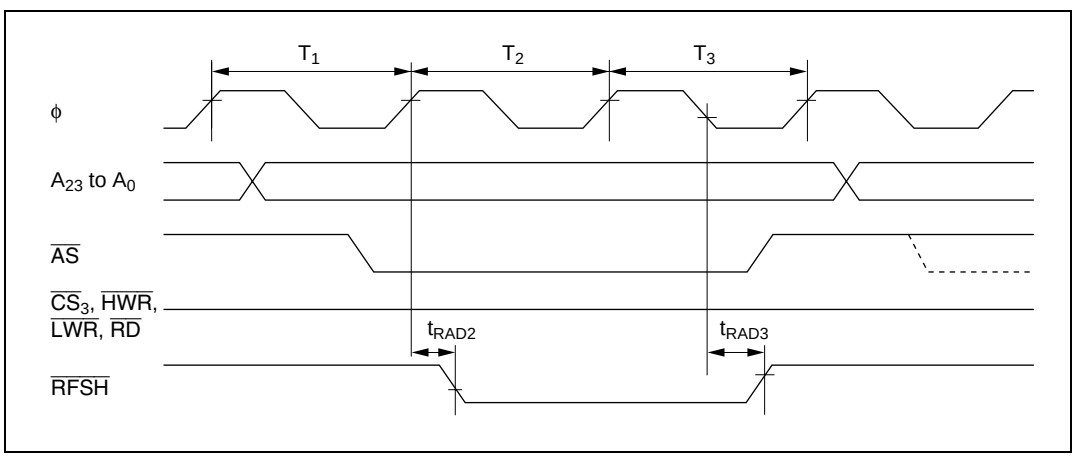

Figure 21.14 PSRAM Bus Timing (Refresh Cycle): Three-State Access

21.3.3 Control Signal Timing

Control signal timing is shown as follows:

- Reset input timing
  Figure 21.15 shows the reset input timing.
- Interrupt input timing
  Figure 21.16 shows the input timing for NMI and $\overline{IRQ_5}$ to $\overline{IRQ_0}$.
- Bus-release mode timing
  Figure 21.17 shows the bus-release mode timing.

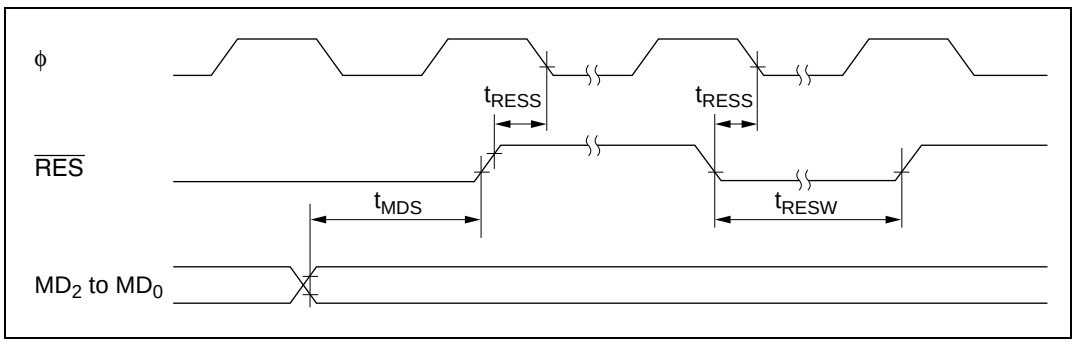

Figure 21.15 Reset Input Timing

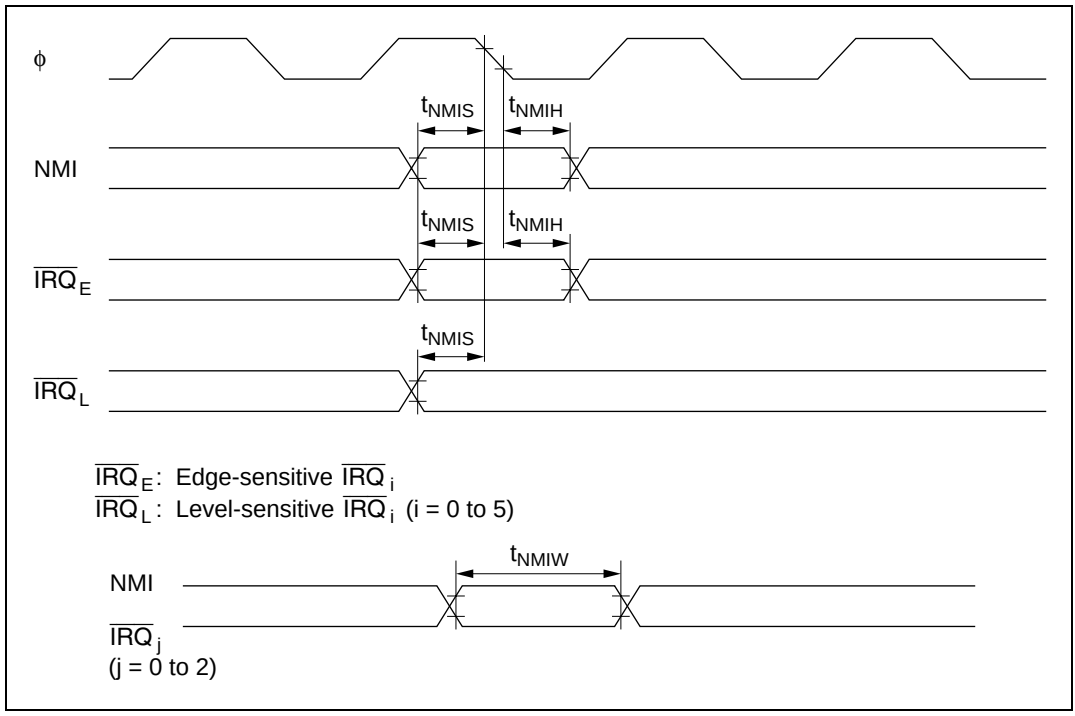

Figure 21.16 Interrupt Input Timing

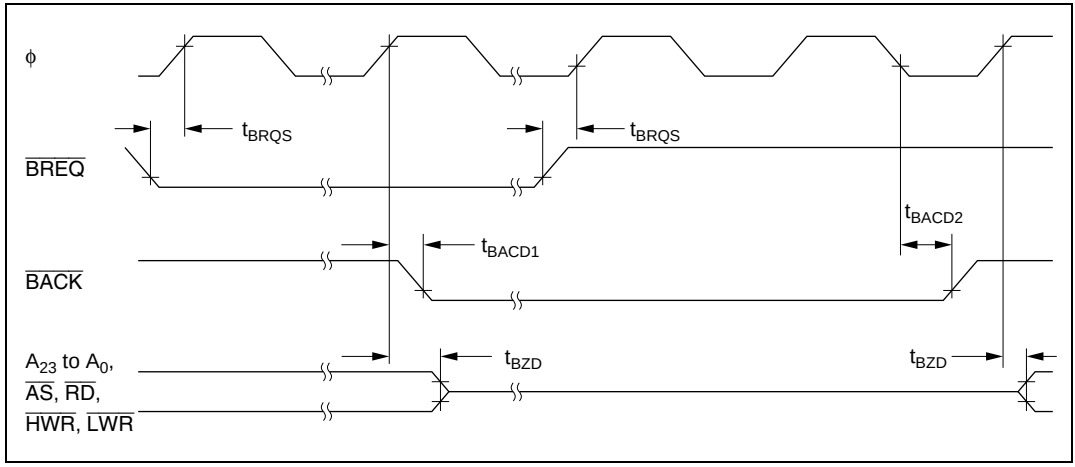

Figure 21.17 Bus-Release Mode Timing

21.3.4 Clock Timing

Clock timing is shown as follows:

- Oscillator settling timing
  Figure 21.18 shows the oscillator settling timing.

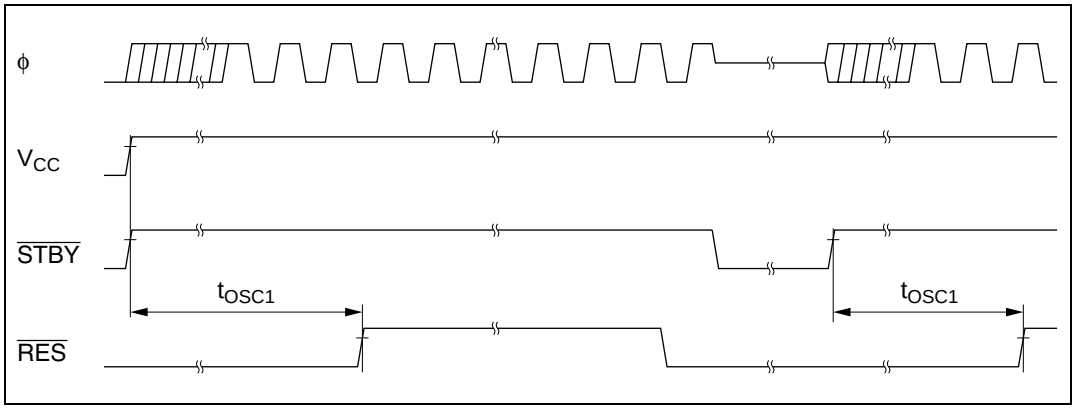

Figure 21.18 Oscillator Settling Timing

21.3.5 TPC and I/O Port Timing

Figure 21.19 shows the TPC and I/O port timing.

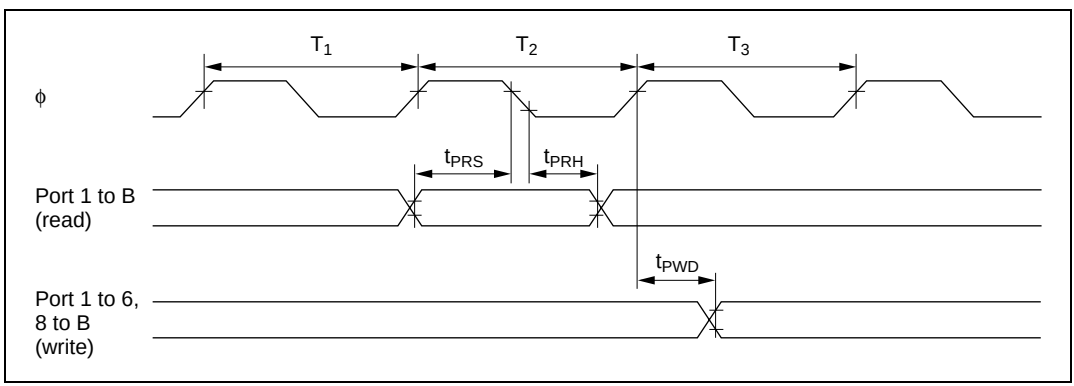

Figure 21.19 TPC and I/O Port Input/Output Timing

21.3.6 ITU Timing

ITU timing is shown as follows:

- ITU input/output timing
  Figure 21.20 shows the ITU input/output timing.
- ITU external clock input timing
  Figure 21.21 shows the ITU external clock input timing.

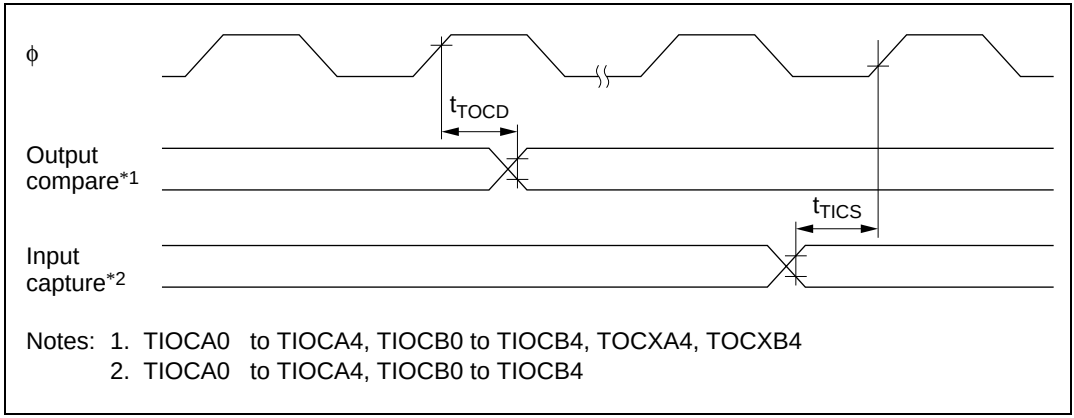

Figure 21.20 ITU Input/Output Timing

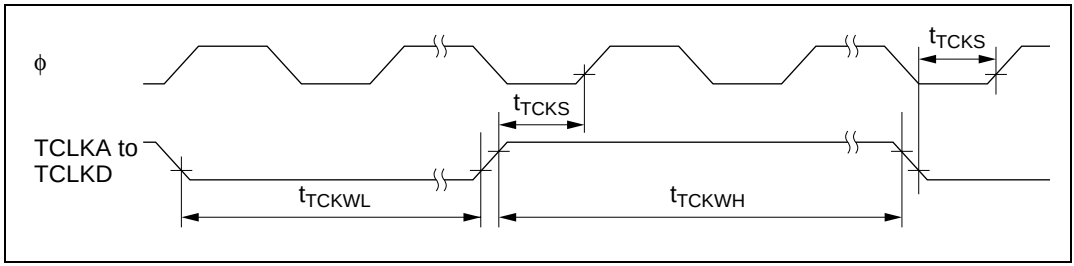

Figure 21.21 ITU External Clock Input Timing

21.3.7 SCI Input/Output Timing

SCI timing is shown as follows:

- SCI input clock timing
  Figure 21.22 shows the SCK input clock timing.
- SCI input/output timing (synchronous mode)
  Figure 21.23 shows the SCI input/output timing in synchronous mode.

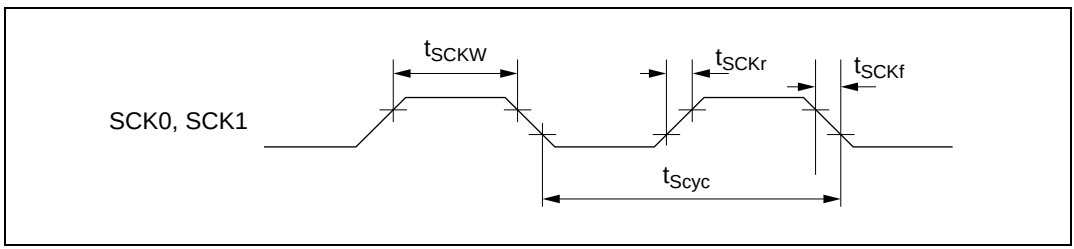

Figure 21.22 SCK Input Clock Timing

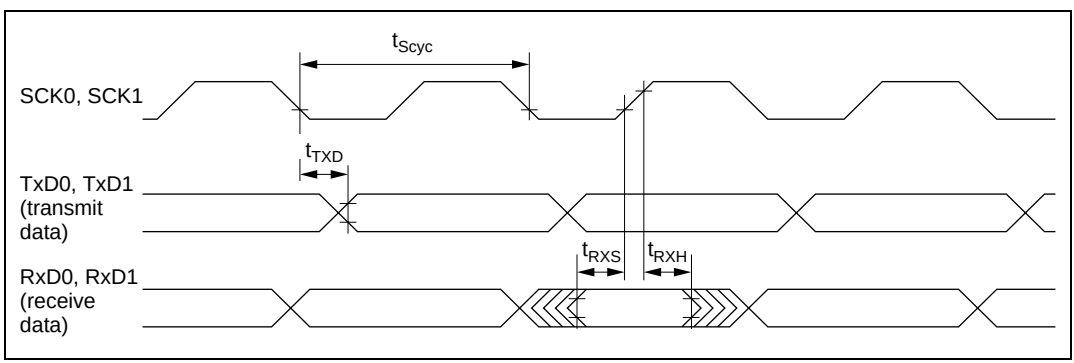

Figure 21.23 SCI Input/Output Timing in Synchronous Mode

21.3.8 DMAC Timing

DMAC timing is shown as follows.

- DMAC $\overline{\text{TEND}}$ output timing for 2 state access
  Figure 21.24 shows the DMAC $\overline{\text{TEND}}$ output timing for 2 state access.
- DMAC $\overline{\text{TEND}}$ output timing for 3 state access
  Figure 21.25 shows the DMAC $\overline{\text{TEND}}$ output timing for 3 state access.
- DMAC $\overline{\text{DREQ}}$ input timing
  Figure 21.26 shows DMAC $\overline{\text{DREQ}}$ input timing.

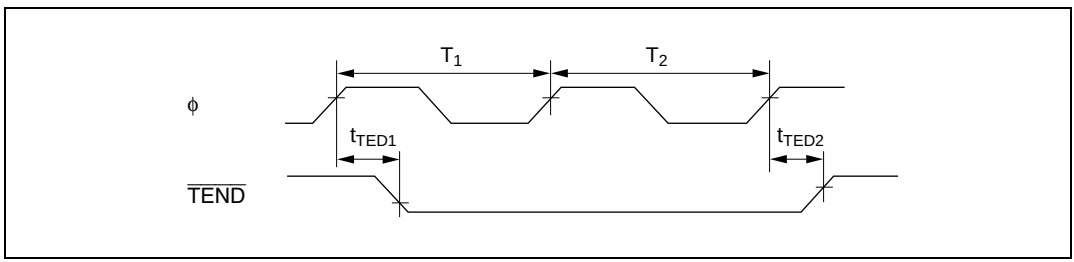

Figure 21.24 DMAC $\overline{\text{TEND}}$ Output Timing for 2 State Access

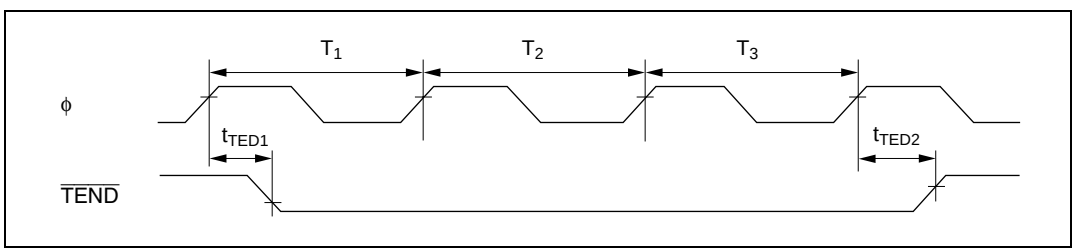

Figure 21.25 DMAC $\overline{\text{TEND}}$ Output Timing for 3 State Access

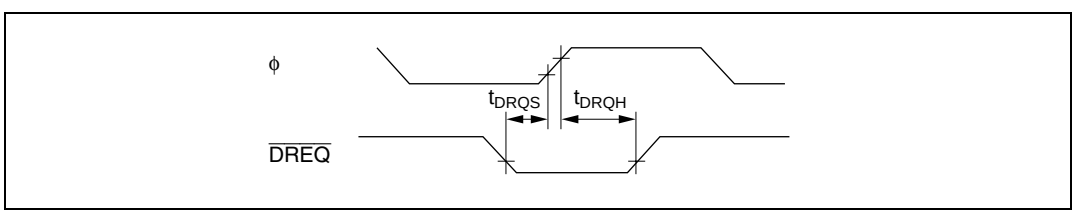

Figure 21.26 DMAC $\overline{\text{DREQ}}$ Input Timing

Appendix A Instruction Set

A.1 Instruction List

Operand Notation

Symbol	Description
Rd	General destination register
Rs	General source register
Rn	General register
ERd	General destination register (address register or 32-bit register)
ERs	General source register (address register or 32-bit register)
ERn	General register (32-bit register)
(EAd)	Destination operand
(EAs)	Source operand
PC	Program counter
SP	Stack pointer
CCR	Condition code register
N	N (negative) flag in CCR
Z	Z (zero) flag in CCR
V	V (overflow) flag in CCR
C	C (carry) flag in CCR
disp	Displacement
→	Transfer from the operand on the left to the operand on the right, or transition from the state on the left to the state on the right
+	Addition of the operands on both sides
–	Subtraction of the operand on the right from the operand on the left
×	Multiplication of the operands on both sides
÷	Division of the operand on the left by the operand on the right
∧	Logical AND of the operands on both sides
∨	Logical OR of the operands on both sides
⊕	Exclusive logical OR of the operands on both sides
¬	NOT (logical complement)
( ), < >	Contents of operand

Note: General registers include 8-bit registers (R0H to R7H and R0L to R7L) and 16-bit registers (R0 to R7 and E0 to E7).

Condition Code Notation

Symbol	Description
↕	Changed according to execution result
*	Undetermined (no guaranteed value)
0	Cleared to 0
1	Set to 1
—	Not affected by execution of the instruction
Δ	Varies depending on conditions, described in notes

Table A.1 Instruction Set

			#xx	Rn	@ERn	@(d, ERn)	@–ERn/@ERn+	@aa	@(d, PC)	@@aa	|	I	H	N	Z	V	C	Normal	Advanced
EEPMOV. B	—	if R4L ≠ 0 then repeat @R5 → @R6 R5+1 → R5 R6+1 → R6 R4L–1 → R4L until R4L=0 else next									4	—	—	—	—	—	—	8+ 4n[*2]	
EEPMOV. W	—	if R4 ≠ 0 then repeat @R5 → @R6 R5+1 → R5 R6+1 → R6 R4–1 → R4 until R4=0 else next									4	—	—	—	—	—	—	8+ 4n[*2]	

Notes: 1. The number of states is the number of states required for execution when the instruction and its operands are located in on-chip memory. For other cases see section A.3, Number of States Required for Execution.

2. n is the value set in register R4L or R4.

(1) Set to 1 when a carry or borrow occurs at bit 11; otherwise cleared to 0.

(2) Set to 1 when a carry or borrow occurs at bit 27; otherwise cleared to 0.

(3) Retains its previous value when the result is zero; otherwise cleared to 0.

(4) Set to 1 when the adjustment produces a carry; otherwise retains its previous value.

(5) The number of states required for execution of an instruction that transfers data in synchronization with the E clock is variable.

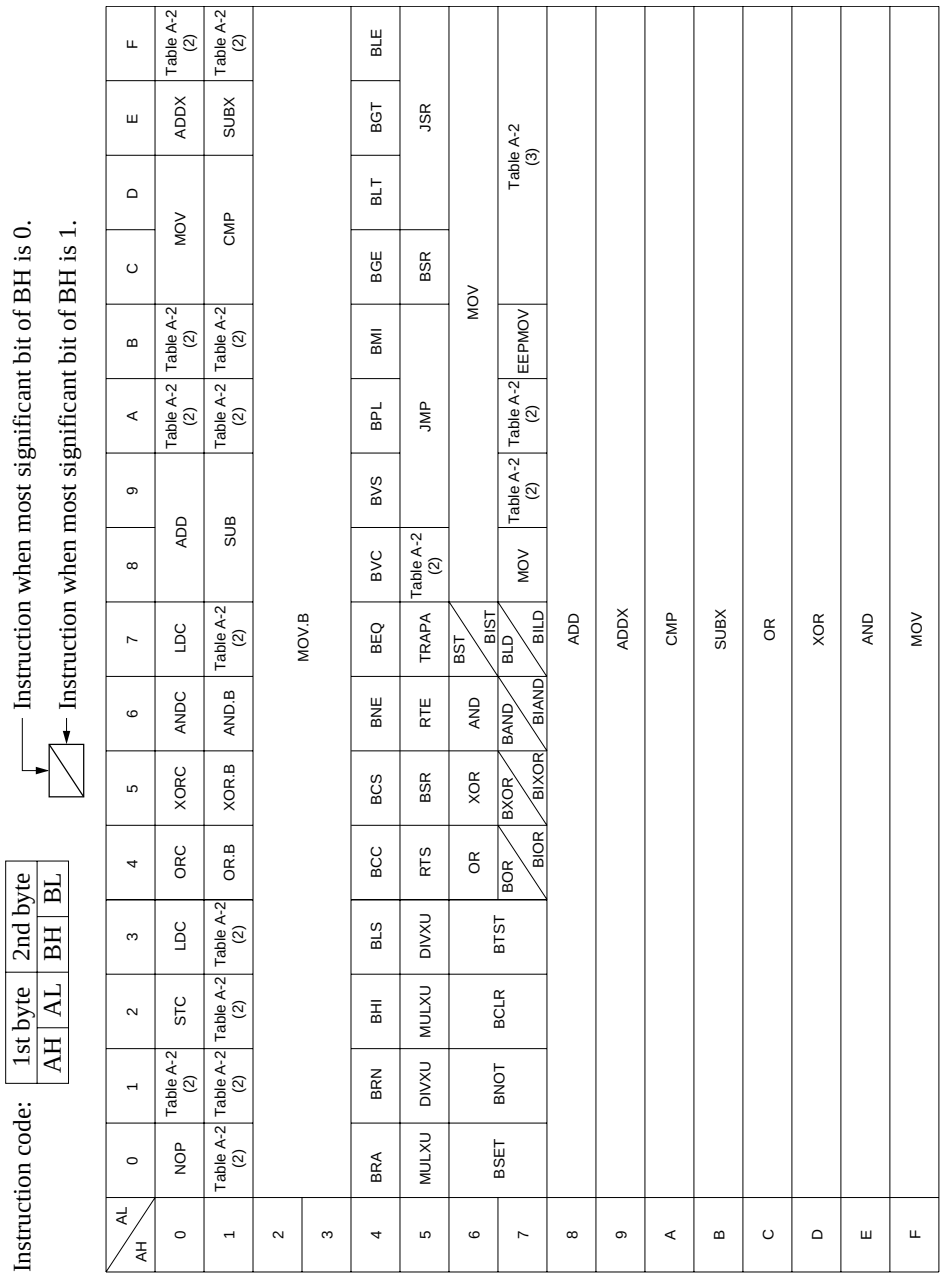
(6) Set to 1 when the divisor is negative; otherwise cleared to 0.

(7) Set to 1 when the divisor is zero; otherwise cleared to 0.

(8) Set to 1 when the quotient is negative; otherwise cleared to 0.

A.2 Operation Code Map

Table A.2 Operation Code Map



Instruction code:

1st byte		2nd byte	
AH	AL	BH	BL

AH AL \ BH	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

7Faa7 *2	BSET	BNOT	BCLR													

Notes: 1. r is the register designation field.
2. aa is the absolute address field.

A.3 Number of States Required for Execution

The tables in this section can be used to calculate the number of states required for instruction execution by the H8/300H CPU. Table A.4 indicates the number of instruction fetch, data read/write, and other cycles occurring in each instruction. Table A.3 indicates the number of states required per cycle according to the bus size. The number of states required for execution of an instruction can be calculated from these two tables as follows:

Number of states = $I \times S_I + J \times S_J + K \times S_K + L \times S_L + M \times S_M + N \times S_N$

Examples of Calculation of Number of States Required for Execution

Examples: Advanced mode, stack located in external address space, on-chip supporting modules accessed with 8-bit bus width, external devices accessed in three states with one wait state and 16-bit bus width.

BSET #0, @FFFFC7:8

From table A.4, I = L = 2 and J = K = M = N = 0
From table A.3, $S_I = 4$ and $S_L = 3$
Number of states = $2 \times 4 + 2 \times 3 = 14$

JSR @@30

From table A.4, I = J = K = 2 and L = M = N = 0
From table A.3, $S_I = S_J = S_K = 4$
Number of states = $2 \times 4 + 2 \times 4 + 2 \times 4 = 24$

Table A.3 Number of States per Cycle

		Access Conditions						
			On-Chip Supporting Module		External Device			
					8-Bit Bus		16-Bit Bus	
Cycle		On-Chip Memory	8-Bit Bus	16-Bit Bus	2-State Access	3-State Access	2-State Access	3-State Access
Instruction fetch	S_I	2	6	3	4	6 + 2 m	2	3 + m
Branch address read	S_J							
Stack operation	S_K							
Byte data access	S_L		3		2	3 + m		
Word data access	S_M		6		4	6 + 2 m		
Internal operation	S_N	1	1	1	1	1	1	1

Legend:
m: Number of wait states inserted into external device access

Legend:

DMAC: DMA controller

ITU: 16-bit integrated timer unit

TPC: Programmable timing pattern controller

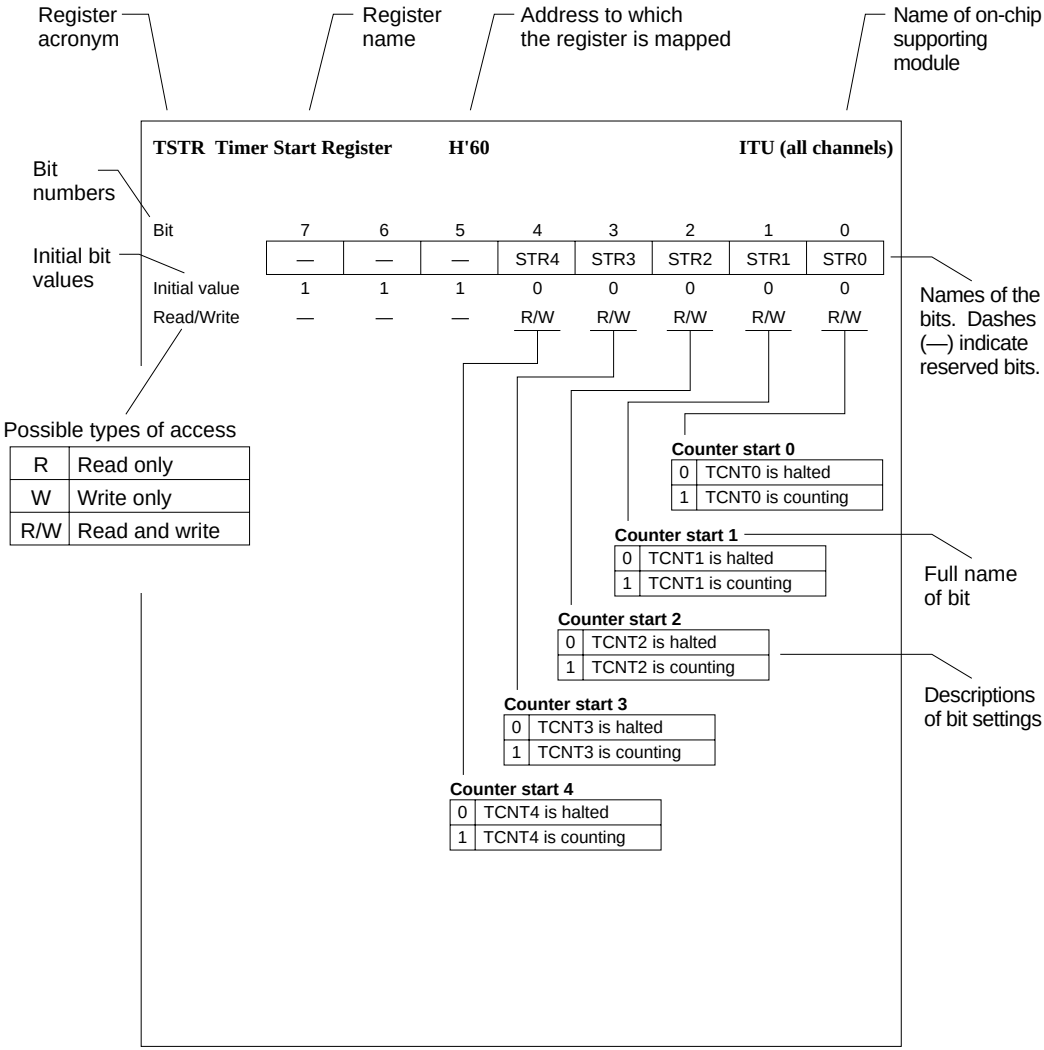
WDT: Watchdog timer

SCI: Serial communication interface

Notes: 1. The address depends on the output trigger setting.

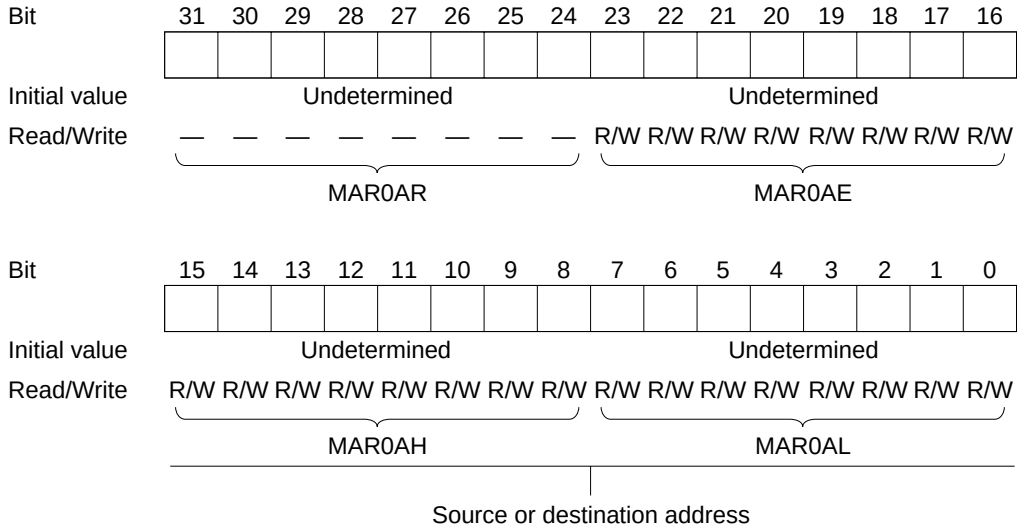
2. For write access to TCSR TCNT, and RSTCR see section 12.2.4, Notes on Register Access.

B.2 Function



Register acronym
Register name
Address to which the register is mapped
Name of on-chip supporting module
TSTR Timer Start Register H'60 ITU (all channels)
Bit numbers
Initial bit values
Bit 7 6 5 4 3 2 1 0
— — — STR4 STR3 STR2 STR1 STR0
Initial value 1 1 1 0 0 0 0 0
Read/Write — — — R/W R/W R/W R/W R/W
Names of the bits. Dashes (—) indicate reserved bits.
Possible types of access
R Read only
W Write only
R/W Read and write
Counter start 0
0 TCNT0 is halted
1 TCNT0 is counting
Counter start 1
0 TCNT1 is halted
1 TCNT1 is counting
Full name of bit
Counter start 2
0 TCNT2 is halted
1 TCNT2 is counting
Descriptions of bit settings
Counter start 3
0 TCNT3 is halted
1 TCNT3 is counting
Counter start 4
0 TCNT4 is halted
1 TCNT4 is counting

MAR0A R/E/H/L—Memory Address Register 0A R/E/H/L **H'20, H'21, H'22, H'23** **DMAC0**



ETCR0A H/L—Execute Transfer Count Register 0A H/L H'24, H'25 DMAC0

- Short address mode
  - — I/O mode and idle mode

  - — Repeat mode

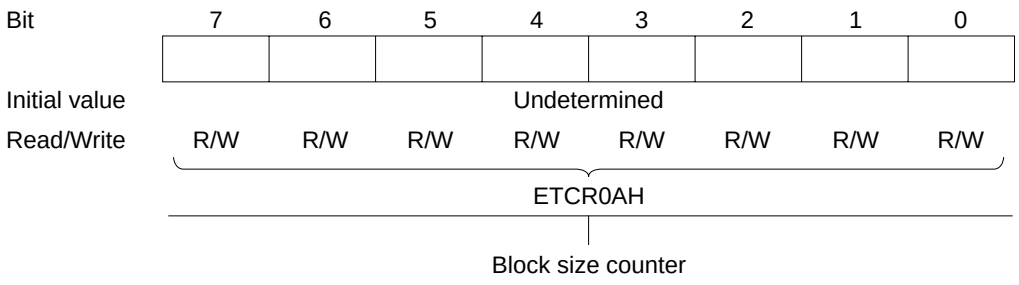
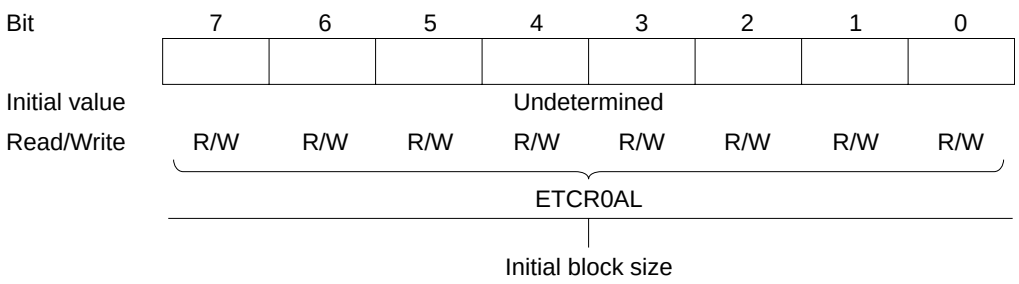
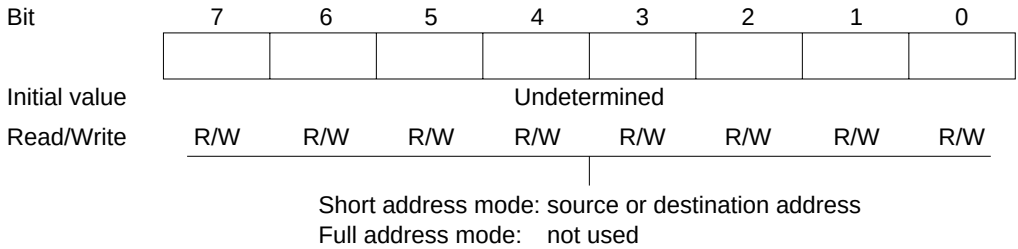
- Full address mode
  - — Normal mode

  - — Block transfer mode





IOAR0A—I/O Address Register 0A **H'26** **DMAC0**



DTCR0A—Data Transfer Control Register 0A **H'27** **DMAC0**

- Short address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	DTID	RPE	DTIE	DTS2	DTS1	DTS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Data transfer select

Bit 2	Bit 1	Bit 0	
DTS2	DTS1	DTS0	Data Transfer Activation Source
0	0	0	Compare match/input capture A interrupt from ITU channel 0
		1	Compare match/input capture A interrupt from ITU channel 1
	1	0	Compare match/input capture A interrupt from ITU channel 2
		1	Compare match/input capture A interrupt from ITU channel 3
1	0	0	SCI0 transmit-data-empty interrupt
		1	SCI0 receive-data-full interrupt
	1	0	Transfer in full address mode
		1	Transfer in full address mode

Data transfer interrupt enable

0	Interrupt requested by DTE bit is disabled
1	Interrupt requested by DTE bit is enabled

Repeat enable

RPE	DTIE	Description
0	0	I/O mode
	1	
1	0	Repeat mode
	1	Idle mode

Data transfer increment/decrement

0	Incremented:	If DTSZ = 0, MAR is incremented by 1 after each transfer If DTSZ = 1, MAR is incremented by 2 after each transfer
1	Decremented:	If DTSZ = 0, MAR is decremented by 1 after each transfer If DTSZ = 1, MAR is decremented by 2 after each transfer

Data transfer size

0	Byte-size transfer
1	Word-size transfer

Data transfer enable

0	Data transfer is disabled
1	Data transfer is enabled

DTCR0A—Data Transfer Control Register 0A (cont) H'27 DMAC0

- Full address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	SAID	SAIDE	DTIE	DTS2A	DTS1A	DTS0A
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Data transfer select 0A

0	Normal mode
1	Block transfer mode

Data transfer select 2A and 1A

Set both bits to 1

Data transfer interrupt enable

0	Interrupt request by DTE bit is disabled
1	Interrupt request by DTE bit is enabled

Source address increment/decrement (bit 5)
Source address increment/decrement enable (bit 4)

Bit 5	Bit 4	
SAID	SAIDE	Increment/Decrement Enable
0	0	MARA is held fixed
	1	Incremented: If DTSZ = 0, MARA is incremented by 1 after each transfer If DTSZ = 1, MARA is incremented by 2 after each transfer
1	0	MARA is held fixed
	1	Decremented: If DTSZ = 0, MARA is decremented by 1 after each transfer If DTSZ = 1, MARA is decremented by 2 after each transfer

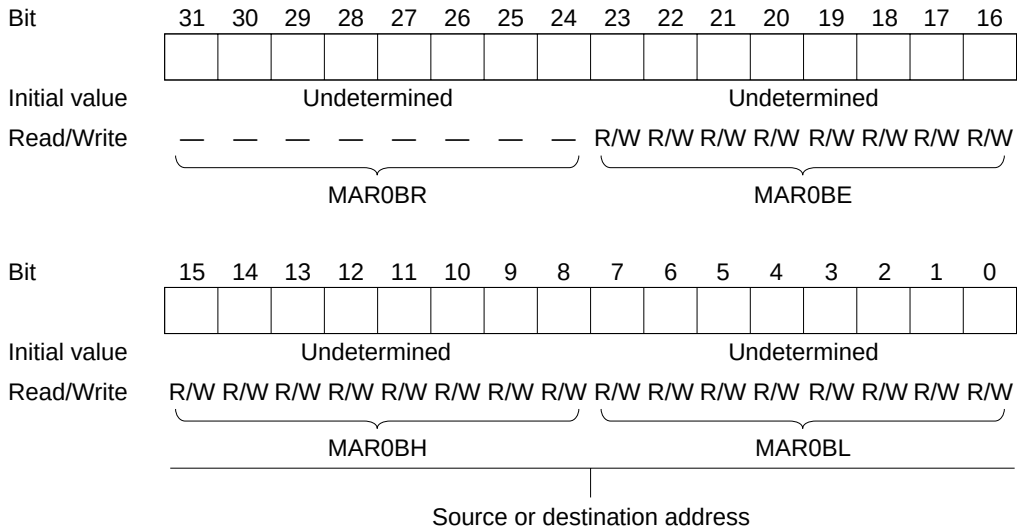
Data transfer size

0	Byte-size transfer
1	Word-size transfer

Data transfer enable

0	Data transfer is disabled
1	Data transfer is enabled

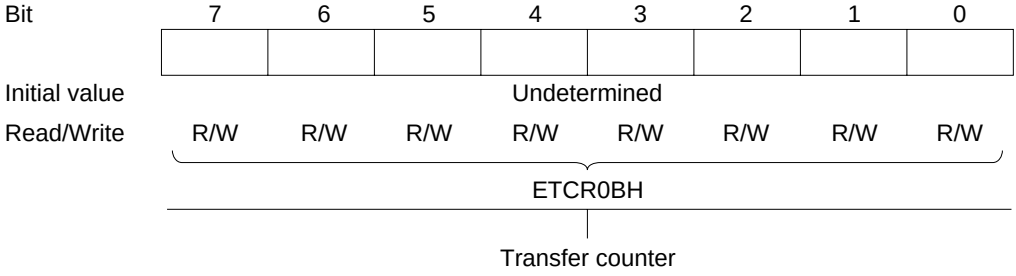
MAR0B R/E/H/L—Memory Address Register 0B R/E/H/L **H'28, H'29, H'2A, H'2B** **DMAC0**

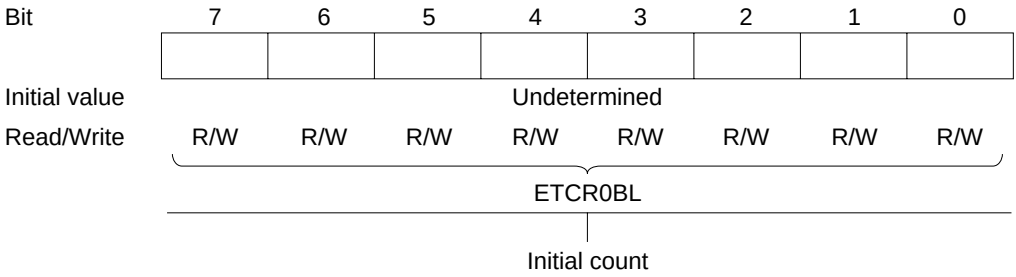


ETCR0B H/L—Execute Transfer Count Register 0B H/L H'2C, H'2D DMAC0

- Short address mode
  - — I/O mode and idle mode

  - — Repeat mode

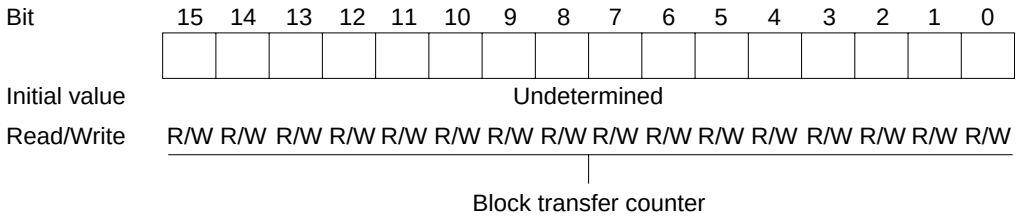




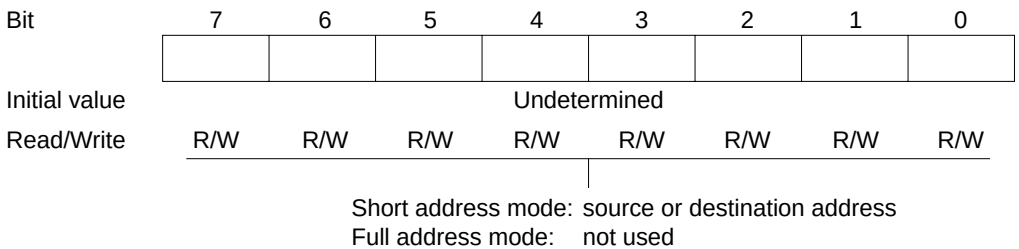
ETCR0B H/L—Execute Transfer Count Register 0B H/L (cont) **H'2C, H'2D** **DMAC0**

- Full address mode
  - Normal mode

  - Block transfer mode



IOAR0B—I/O Address Register 0B **H'2E** **DMAC0**



DTCR0B—Data Transfer Control Register 0B **H'2F** **DMAC0**

- Short address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	DTID	RPE	DTIE	DTS2	DTS1	DTS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Data transfer select

Bit 2	Bit 1	Bit 0	
DTS2	DTS1	DTS0	Data Transfer Activation Source
0	0	0	Compare match/input capture A interrupt from ITU channel 0
		1	Compare match/input capture A interrupt from ITU channel 1
	1	0	Compare match/input capture A interrupt from ITU channel 2
		1	Compare match/input capture A interrupt from ITU channel 3
1	0	0	SCI0 transmit-data-empty interrupt
		1	SCI0 receive-data-full interrupt
	1	0	Falling edge of $\overline{\text{DREQ}}$ input
		1	Low level of $\overline{\text{DREQ}}$ input

Data transfer interrupt enable

0	Interrupt requested by DTE bit is disabled
1	Interrupt requested by DTE bit is enabled An interrupt request is issued to the CPU when the DTE bit = 0

Repeat enable

RPE	DTIE	Description
0	0	I/O mode
	1	
1	0	Repeat mode
	1	Idle mode

Data transfer increment/decrement

0	Incremented: If DTSZ = 0, MAR is incremented by 1 after each transfer If DTSZ = 1, MAR is incremented by 2 after each transfer
1	Decremented: If DTSZ = 0, MAR is decremented by 1 after each transfer If DTSZ = 1, MAR is decremented by 2 after each transfer

Data transfer size

0	Byte-size transfer
1	Word-size transfer

Data transfer enable

0	Data transfer is disabled
1	Data transfer is enabled

DTCR0B—Data Transfer Control Register 0B (cont) H'2F DMAC0

- Full address mode

Bit	7	6	5	4	3	2	1	0
	DTME	—	DAID	DAIDE	TMS	DTS2B	DTS1B	DTS0B
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Data transfer select 2B to 0B

Bit 2	Bit 1	Bit 0	Data Transfer Activation Source	
DTS2B	DTS1B	DTS0B	Normal Mode	Block Transfer Mode
0	0	0	Auto-request (burst mode)	Compare match/input capture A from ITU channel 0
		1	Not available	Compare match/input capture A from ITU channel 1
	1	0	Auto-request (cycle-steal mode)	Compare match/input capture A from ITU channel 2
		1	Not available	Compare match/input capture A from ITU channel 3
1	0	0	Not available	Not available
		1	Not available	Not available
	1	0	Falling edge of $\overline{\text{DREQ}}$	Falling edge of $\overline{\text{DREQ}}$
		1	Low level input at $\overline{\text{DREQ}}$	Not available

Transfer mode select

0	Destination is the block area in block transfer mode
1	Source is the block area in block transfer mode

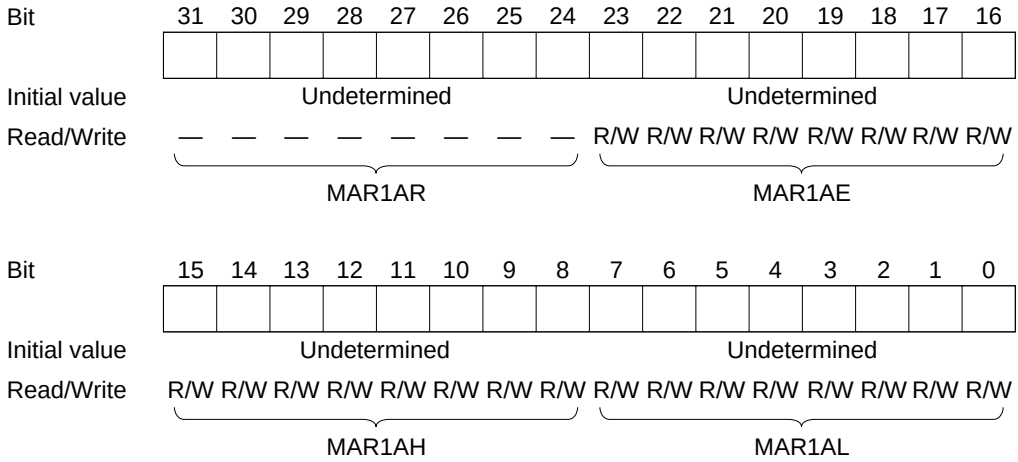
Destination address increment/decrement (bit 5)
Destination address increment/decrement enable (bit 4)

Bit 5	Bit 4	
DAID	DAIDE	Increment/Decrement Enable
0	0	MARB is held fixed
	1	Incremented: If DTSZ = 0, MARB is incremented by 1 after each transfer If DTSZ = 1, MARB is incremented by 2 after each transfer
1	0	MARB is held fixed
	1	Decremented: If DTSZ = 0, MARB is decremented by 1 after each transfer If DTSZ = 1, MARB is decremented by 2 after each transfer

Data transfer master enable

0	Data transfer is disabled
1	Data transfer is enabled

MAR1A R/E/H/L—Memory Address Register 1A R/E/H/L **H'30, H'31, H'32, H'33** **DMAC1**



Note: Bit functions are the same as for DMAC0.

ETCR1A H/L—Execute Transfer Count Register 1A H/L H'34, H'35 DMAC1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	Undetermined															
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

ETCR1AH

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

ETCR1AL

Note: Bit functions are the same as for DMAC0.

IOAR1A—I/O Address Register 1A H'36 DMAC1

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for DMAC0.

DTCR1A—Data Transfer Control Register 1A **H'37** **DMAC1**

- Short address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	DTID	RPE	DTIE	DTS2	DTS1	DTS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Full address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	SAID	SAIDE	DTIE	DTS2A	DTS1A	DTS0A
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for DMAC0.

MAR1B R/E/H/L—Memory Address Register 1B R/E/H/L **H'38, H'39, H'3A, H'3B** **DMAC1**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value	Undetermined								Undetermined							
Read/Write	—	—	—	—	—	—	—	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	MAR1BR								MAR1BE							

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	Undetermined								Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	MAR1BH								MAR1BL							

Note: Bit functions are the same as for DMAC0.

ETCR1B H/L—Execute Transfer Count Register 1B H/L H'3C, H'3D DMAC1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	Undetermined															
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

ETCR1BH

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

ETCR1BL

Note: Bit functions are the same as for DMAC0.

IOAR1B—I/O Address Register 1B H'3E DMAC1

Bit	7	6	5	4	3	2	1	0
Initial value	Undetermined							
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for DMAC0.

DTCR1B—Data Transfer Control Register 1B **H'3F** **DMAC1**

- Short address mode

Bit	7	6	5	4	3	2	1	0
	DTE	DTSZ	DTID	RPE	DTIE	DTS2	DTS1	DTS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Full address mode

Bit	7	6	5	4	3	2	1	0
	DTME	—	DAID	DAIDE	TMS	DTS2B	DTS1B	DTS0B
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for DMAC0.

FLMCR1—Flash Memory Control Register 1 **H'40** **Flash memory**

Bit	7	6	5	4	3	2	1	0
	FWE	SWE1	ESU1	PSU1	EV1	PV1	E1	P1
Initial value*	1	0	0	0	0	0	0	0
Read/Write	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Program mode 1

0	Program mode cleared (Initial value)
1	Transition to program mode

Erase mode 1

0	Erase mode cleared (Initial value)
1	Transition to erase mode

Program-verify mode 1

0	Program-verify mode cleared (Initial value)
1	Transition to program-verify mode

Erase-verify mode 1

0	Erase-verify mode cleared (Initial value)
1	Transition to erase-verify mode

Program setup bit 1

0	Program setup cleared (Initial value)
1	Program setup

Erase setup bit 1

0	Erase setup cleared (Initial value)
1	Erase setup

Software write enable bit 1

0	Write disabled (Initial value)
1	Write enabled

Flash write enable bit

0	When a low level is input to the FWE pin (hardware protection state)
1	When a high level is input to the FWE pin

Note: * The initial value is H'00 in modes 5, 6, and 7 (on-chip flash memory enabled). In modes 1, 2, 3, and 4 (on-chip flash memory disabled), this register cannot be modified and is always read as H'FF.

FLMCR2—Flash Memory Control Register 2 H'41 Flash memory

Bit	7	6	5	4	3	2	1	0
	FLER	SWE2	ESU2	PSU2	EV2	PV2	E2	P2
Initial value*	0	0	0	0	0	0	0	0
Read/Write	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Program mode 2

0	Program mode cleared (Initial value)
1	Transition to program mode

Erase mode 2

0	Erase mode cleared (Initial value)
1	Transition to erase mode

Program-verify mode 2

0	Program-verify mode cleared (Initial value)
1	Transition to program-verify mode

Erase-verify mode 2

0	Erase-verify mode cleared (Initial value)
1	Transition to erase-verify mode

Program setup bit 2

0	Program setup cleared (Initial value)
1	Program setup

Erase setup bit 2

0	Erase setup cleared (Initial value)
1	Erase setup

Software write enable bit 2

0	Write disabled (Initial value)
1	Write enabled

Flash memory error

0	Flash memory is operating normally Flash memory program/erase protection (error protection) is disabled (Initial value)
1	An error occurred during flash memory programming/erasing Flash memory program/erase protection (error protection) is enabled

Note: * The initial value is H'00 in modes 5, 6, and 7 (on-chip flash memory enabled). In modes 1, 2, 3, and 4 (on-chip flash memory disabled), this register cannot be modified and is always read as H'FF.

EBR1—Erase Block Register 1 **H'42** **Flash memory**

Bit	7	6	5	4	3	2	1	0
	EB7	EB6	EB5	EB4	EB3	EB2	EB1	EB1
Initial value*	0	0	0	0	0	0	0	0
Read/Write	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Erase block specification bits (1)

0	Erase protection state
1	Erasable state

Note: * The initial value is H'00 in modes 5, 6 and 7 (on-chip ROM enabled). In modes 1, 2, 3, and 4 (on-chip ROM disabled), this register cannot be modified and is always read as H'FF.

EBR2—Erase Block Register 2 **H'43** **Flash memory**

Bit	7	6	5	4	3	2	1	0
	EB15	EB14	EB13	EB12	EB11	EB10	EB9	EB8
Initial value*	0	0	0	0	0	0	0	0
Read/Write	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Erase block specification bits (2)

0	Erase protection state
1	Erasable state

Note: * The initial value is H'00 in modes 5, 6 and 7 (on-chip ROM enabled). In modes 1, 2, 3, and 4 (on-chip ROM disabled), this register cannot be modified and is always read as H'FF.

RAMCR—RAM Control Register **H'47** **Flash memory**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RAMS	RAM2	RAM1	RAM0
Initial value*	1	1	1	1	0	0	0	0
Read/Write	R	R	R	R	R/W	R/W	R/W	R/W

RAM select, RAM 2 to RAM 0

Bit 3	Bit 2	Bit 1	Bit 0	RAM Area
RAMS	RAM 2	RAM 1	RAM 0	
0	1/0	1/0	1/0	H'FFE000 to H'FFEFFF
1	0	0	0	H'000000 to H'000FFF
			1	H'001000 to H'001FFF
		1	0	H'002000 to H'002FFF
			1	H'003000 to H'003FFF
	1	0	0	H'004000 to H'004FFF
			1	H'005000 to H'005FFF
		1	0	H'006000 to H'006FFF
			1	H'007000 to H'007FFF

DASTCR—D/A Standby Control Register **H'5C** **System control**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DASTE
Initial value	1	1	1	1	1	1	1	0
Read/Write	—	—	—	—	—	—	—	R/W

D/A standby enable

0	D/A output is disabled in software standby mode
1	D/A output is enabled in software standby mode

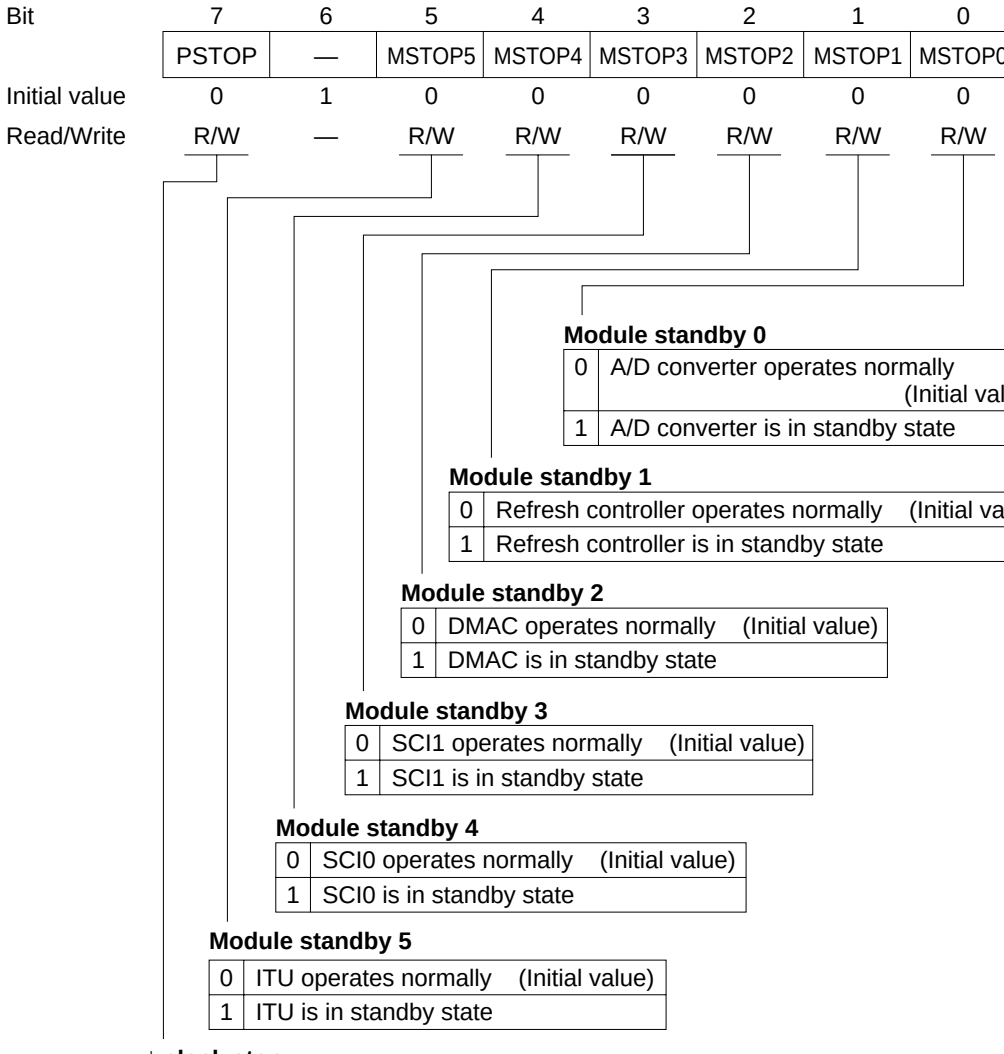
DIVCR—Division Control Register **H'5D** **System control**

Bit	7	6	5	7	3	2	1	0
	—	—	—	—	—	—	DIV1	DIV0
Initial value	1	1	1	1	1	1	0	0
Read/Write	—	—	—	—	—	—	R/W	R/W

Divide 1 and 0

Bit 1	Bit 0	Frequency Division Ratio
DIV1	DIV0	
0	0	1/1 (Initial value)
	1	1/2
1	0	1/4
	1	1/8

MSTCR—Module Standby Control Register **H'5E** **System control**



CSCR—Chip Select Control Register **H'5F** **System control**

Bit	7	6	5	4	3	2	1	0
	CS7E	CS6E	CS5E	CS4E	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Chip select 7 to 4 enable

Bit n	
CSnE	Description
0	Output of chip select signal CSn is disabled (Initial value)
1	Output of chip select signal CSn is enabled

(n = 7 to 4)

TSTR—Timer Start Register **H'60** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	STR4	STR3	STR2	STR1	STR0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Counter start 0

0	TCNT0 is halted
1	TCNT0 is counting

Counter start 1

0	TCNT1 is halted
1	TCNT1 is counting

Counter start 2

0	TCNT2 is halted
1	TCNT2 is counting

Counter start 3

0	TCNT3 is halted
1	TCNT3 is counting

Counter start 4

0	TCNT4 is halted
1	TCNT4 is counting

TSNC—Timer Synchro Register **H'61** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	SYNC4	SYNC3	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Timer sync 0

0	TCNT0 operates independently
1	TCNT0 is synchronized

Timer sync 1

0	TCNT1 operates independently
1	TCNT1 is synchronized

Timer sync 2

0	TCNT2 operates independently
1	TCNT2 is synchronized

Timer sync 3

0	TCNT3 operates independently
1	TCNT3 is synchronized

Timer sync 4

0	TCNT4 operates independently
1	TCNT4 is synchronized

TMDR—Timer Mode Register **H'62** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	PWM4	PWM3	PWM2	PWM1	PWM0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

PWM mode 0

0	Channel 0 operates normally
1	Channel 0 operates in PWM mode

PWM mode 1

0	Channel 1 operates normally
1	Channel 1 operates in PWM mode

PWM mode 2

0	Channel 2 operates normally
1	Channel 2 operates in PWM mode

PWM mode 3

0	Channel 3 operates normally
1	Channel 3 operates in PWM mode

PWM mode 4

0	Channel 4 operates normally
1	Channel 4 operates in PWM mode

Flag direction

0	OVF is set to 1 in TSR2 when TCNT2 overflows or underflows
1	OVF is set to 1 in TSR2 when TCNT2 overflows

Phase counting mode flag

0	Channel 2 operates normally
1	Channel 2 operates in phase counting mode

TFCR—Timer Function Control Register **H'63** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	CMD1	CMD0	BFB4	BFA4	BFB3	BFA3
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Buffer mode A3

0	GRA3 operates normally
1	GRA3 is buffered by BRA3

Buffer mode B3

0	GRB3 operates normally
1	GRB3 is buffered by BRB3

Buffer mode A4

0	GRA4 operates normally
1	GRA4 is buffered by BRA4

Buffer mode B4

0	GRB4 operates normally
1	GRB4 is buffered by BRB4

Combination mode 1 and 0

Bit 5	Bit 4	
CMD1	CMD0	Operating Mode of Channels 3 and 4
0	0	Channels 3 and 4 operate normally
	1	
1	0	Channels 3 and 4 operate together in complementary PWM mode
	1	Channels 3 and 4 operate together in reset-synchronized PWM mode

TCR0—Timer Control Register 0 **H'64** **ITU0**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Timer prescaler 2 to 0

Bit 2	Bit 1	Bit 0	
TPSC2	TPSC1	TPSC0	TCNT Clock Source
0	0	0	Internal clock: φ
		1	Internal clock: φ/2
	1	0	Internal clock: φ/4
		1	Internal clock: φ/8
1	0	0	External clock A: TCLKA input
		1	External clock B: TCLKB input
	1	0	External clock C: TCLKC input
		1	External clock D: TCLKD input

Clock edge 1 and 0

Bit 4	Bit 3	
CKEG1	CKEG0	Counted Edges of External Clock
0	0	Rising edges counted
	1	Falling edges counted
1	—	Both edges counted

Counter clear 1 and 0

Bit 6	Bit 5	
CCLR1	CCLR0	TCNT Clear Source
0	0	TCNT is not cleared
	1	TCNT is cleared by GRA compare match or input capture
1	0	TCNT is cleared by GRB compare match or input capture
	1	Synchronous clear: TCNT is cleared in synchronization with other synchronized timers

TIOR0—Timer I/O Control Register 0 **H'65** **ITU0**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

I/O control A2 to A0

Bit 2	Bit 1	Bit 0		
IOA2	IOA1	IOA0	GRA Function	
0	0	0	GRA is an output compare register	No output at compare match
		1		0 output at GRA compare match
	1	0		1 output at GRA compare match
		1		Output toggles at GRA compare match
1	0	0	GRA is an input capture register	GRA captures rising edge of input
		1		GRA captures falling edge of input
	1	0		GRA captures both edges of input
		1		

I/O control B2 to B0

Bit 6	Bit 5	Bit 4		
IOB2	IOB1	IOB0	GRB Function	
0	0	0	GRB is an output compare register	No output at compare match
		1		0 output at GRB compare match
	1	0		1 output at GRB compare match
		1		Output toggles at GRB compare match
1	0	0	GRB is an input capture register	GRB captures rising edge of input
		1		GRB captures falling edge of input
	1	0		GRB captures both edges of input
		1		

TIER0—Timer Interrupt Enable Register 0 **H'66** **ITU0**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Input capture/compare match interrupt enable A

0	IMIA interrupt requested by IMFA flag is disabled
1	IMIA interrupt requested by IMFA flag is enabled

Input capture/compare match interrupt enable B

0	IMIB interrupt requested by IMFB flag is disabled
1	IMIB interrupt requested by IMFB flag is enabled

Overflow interrupt enable

0	OVI interrupt requested by OVF flag is disabled
1	OVI interrupt requested by OVF flag is enabled

TSR0—Timer Status Register 0 **H'67** **ITU0**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Input capture/compare match flag A

0	[Clearing condition] Read IMFA when IMFA = 1, then write 0 in IMFA
1	[Setting conditions] • TCNT = GRA when GRA functions as an output compare register. • TCNT value is transferred to GRA by an input capture signal, when GRA functions as an input capture register.

Input capture/compare match flag B

0	[Clearing condition] Read IMFB when IMFB = 1, then write 0 in IMFB
1	[Setting conditions] • TCNT = GRB when GRB functions as an output compare register. • TCNT value is transferred to GRB by an input capture signal, when GRB functions as an input capture register.

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] TCNT overflowed from H'FFFF to H'0000 or underflowed from H'0000 to H'FFFF

Note: * Only 0 can be written, to clear the flag.

TCNT0 H/L—Timer Counter 0 H/L **H'68, H'69** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Up-counter

GRA0 H/L—General Register A0 H/L **H'6A, H'6B** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register

GRB0 H/L—General Register B0 H/L **H'6C, H'6D** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register

TCR1—Timer Control Register 1 **H'6E** **ITU1**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR1—Timer I/O Control Register 1 **H'6F** **ITU1**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER1—Timer Interrupt Enable Register 1 **H'70** **ITU1**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR1—Timer Status Register 1 **H'71** **ITU1**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Notes: Bit functions are the same as for ITU0.
* Only 0 can be written, to clear the flag.

TCNT1 H/L—Timer Counter 1 H/L **H'72, H'73** **ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRA1 H/L—General Register A1 H/L **H'74, H'75** **ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRB1 H/L—General Register B1 H/L **H'76, H'77** **ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TCR2—Timer Control Register 2 **H'78** **ITU2**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Notes: 1. Bit functions are the same as for ITU0.
2. When channel 2 is used in phase counting mode, the counter clock source selection by bits TPSC2 to TPSC0 is ignored.

TIOR2—Timer I/O Control Register 2 **H'79** **ITU2**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER2—Timer Interrupt Enable Register 2 **H'7A** **ITU2**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR2—Timer Status Register 2 **H'7B** **ITU2**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written, to clear the flag.

The function is the same as ITU0.

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF.
1	[Setting condition] The TCNT value overflows (from H'FFFF to H'0000) or underflows (from H'0000 to H'FFFF)

TCNT2 H/L—Timer Counter 2 H/L **H'7C, H'7D** **ITU2**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Phase counting mode: up/down counter
Other modes: up-counter

GRA2 H/L—General Register A2 H/L **H'7E, H'7F** **ITU2**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRB2 H/L—General Register B2 H/L **H'80, H'81** **ITU2**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TCR3—Timer Control Register 3 **H'82** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR3—Timer I/O Control Register 3 **H'83** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER3—Timer Interrupt Enable Register 3 **H'84** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR3—Timer Status Register 3 **H'85** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Bit functions are the same as for ITU0

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 1 in OVF
1	[Setting condition] TCNT overflowed from H'FFFF to H'0000 or underflowed from H'0000 to H'FFFF

Note: * Only 0 can be written, to clear the flag.

TCNT3 H/L—Timer Counter 3 H/L **H'86, H'87** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Complementary PWM mode: up/down counter
Other modes: up-counter

GRA3 H/L—General Register A3 H/L **H'88, H'89** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register (can be buffered)

GRB3 H/L—General Register B3 H/L **H'8A, H'8B** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register (can be buffered)

BRA3 H/L—Buffer Register A3 H/L **H'8C, H'8D** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Used in combination with GRA when buffer operation is selected

BRB3 H/L—Buffer Register B3 H/L **H'8E, H'8F** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Used in combination with GRB when buffer operation is selected

TOER—Timer Output Enable Register **H'90** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	EXB4	EXA4	EB3	EB4	EA4	EA3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Master enable TIOCA3

0	$TIOCA_3$ output is disabled regardless of TIOR3, TMDR, and TFCR settings
1	$TIOCA_3$ is enabled for output according to TIOR3, TMDR, and TFCR settings

Master enable TIOCA4

0	$TIOCA_4$ output is disabled regardless of TIOR4, TMDR, and TFCR settings
1	$TIOCA_4$ is enabled for output according to TIOR4, TMDR, and TFCR settings

Master enable TIOCB4

0	$TIOCB_4$ output is disabled regardless of TIOR4 and TFCR settings
1	$TIOCB_4$ is enabled for output according to TIOR4 and TFCR settings

Master enable TIOCB3

0	$TIOCB_3$ output is disabled regardless of TIOR3 and TFCR settings
1	$TIOCB_3$ is enabled for output according to TIOR3 and TFCR settings

Master enable TOCXA4

0	$TOCXA_4$ output is disabled regardless of TFCR settings
1	$TOCXA_4$ is enabled for output according to TFCR settings

Master enable TOCXB4

0	$TOCXB_4$ output is disabled regardless of TFCR settings
1	$TOCXB_4$ is enabled for output according to TFCR settings

TOCR—Timer Output Control Register **H'91** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	XTGD	—	—	OLS4	OLS3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	R/W	—	—	R/W	R/W

Output level select 3

0	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are inverted
1	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are not inverted

Output level select 4

0	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are inverted
1	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are not inverted

External trigger disable

0	Input capture A in channel 1 is used as an external trigger signal in reset-synchronized PWM mode and complementary PWM mode*
1	External triggering is disabled

Note: * When an external trigger occurs, bits 5 to 0 in TOER are cleared to 0, disabling ITU output.

TCR4—Timer Control Register 4 **H'92** **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR4—Timer I/O Control Register 4 **H'93** **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER4—Timer Interrupt Enable Register 4 **H'94** **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR4—Timer Status Register 4 **H'95** **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Notes: Bit functions are the same as for ITU0.
* Only 0 can be written, to clear the flag.

TCNT4 H/L—Timer Counter 4 H/L **H'96, H'97** **ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

GRA4 H/L—General Register A4 H/L **H'98, H'99** **ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

GRB4 H/L—General Register B4 H/L **H'9A, H'9B** **ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

BRA4 H/L—Buffer Register A4 H/L **H'9C, H'9D** **ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

BRB4 H/L—Buffer Register B4 H/L **H'9E, H'9F** **ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

TPMR—TPC Output Mode Register **H'A0** **TPC**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	G3NOV	G2NOV	G1NOV	G0NOV
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Group 0 non-overlap

0	Normal TPC output in group 0 Output values change at compare match A in the selected ITU channel
1	Non-overlapping TPC output in group 0, controlled by compare match A and B in the selected ITU channel

Group 1 non-overlap

0	Normal TPC output in group 1 Output values change at compare match A in the selected ITU channel
1	Non-overlapping TPC output in group 1, controlled by compare match A and B in the selected ITU channel

Group 2 non-overlap

0	Normal TPC output in group 2 Output values change at compare match A in the selected ITU channel
1	Non-overlapping TPC output in group 2, controlled by compare match A and B in the selected ITU channel

Group 3 non-overlap

0	Normal TPC output in group 3 Output values change at compare match A in the selected ITU channel
1	Non-overlapping TPC output in group 3, controlled by compare match A and B in the selected ITU channel

TPCR—TPC Output Control Register **H'A1** **TPC**

Bit	7	6	5	4	3	2	1	0
	G3CMS1	G3CMS0	G2CMS1	G2CMS0	G1CMS1	G1CMS0	G0CMS1	G0CMS0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Group 0 compare match select 1 and 0

Bit 1	Bit 0	
G0CMS1	G0CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 0
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 1
1	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 2
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 3

Group 1 compare match select 1 and 0

Bit 3	Bit 2	
G1CMS1	G1CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 0
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 1
1	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 2
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 3

Group 2 compare match select 1 and 0

Bit 5	Bit 4	
G2CMS1	G2CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 0
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 1
1	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 2
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 3

Group 3 compare match select 1 and 0

Bit 7	Bit 6	
G3CMS1	G3CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 0
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 1
1	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 2
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 3

NDERB—Next Data Enable Register B H'A2 TPC

Bit	7	6	5	4	3	2	1	0
	NDER15	NDER14	NDER13	NDER12	NDER11	NDER10	NDER9	NDER8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 15 to 8

Bits 7 to 0	
NDER15 to NDER8	Description
0	TPC outputs TP_{15} to TP_8 are disabled (NDR15 to NDR8 are not transferred to PB_7 to PB_0)
1	TPC outputs TP_{15} to TP_8 are enabled (NDR15 to NDR8 are transferred to PB_7 to PB_0)

NDERA—Next Data Enable Register A H'A3 TPC

Bit	7	6	5	4	3	2	1	0
	NDER7	NDER6	NDER5	NDER4	NDER3	NDER2	NDER1	NDER0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 7 to 0

Bits 7 to 0	
NDER7 to NDER0	Description
0	TPC outputs TP_7 to TP_0 are disabled (NDR7 to NDR0 are not transferred to PA_7 to PA_0)
1	TPC outputs TP_7 to TP_0 are enabled (NDR7 to NDR0 are transferred to PA_7 to PA_0)

NDRB—Next Data Register B **H'A4/H'A6** **TPC**

- Same trigger for TPC output groups 2 and 3
  - — Address H'FFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	NDR11	NDR10	NDR9	NDR8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Store the next output data for TPC output group 3

Store the next output data for TPC output group 2

  - — Address H'FFA6

Bit	7	6	5	4	3	2	1	0

Store the next output data for TPC output group 1

Store the next output data for TPC output group 0

  - — Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

- Different triggers for TPC output groups 0 and 1
  - — Address H'FFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Store the next output data for TPC output group 1

— Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR3	NDR2	NDR1	NDR0
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Store the next output data for TPC output group 0

TCSR—Timer Control/Status Register **H'A8** **WDT**

Bit	7	6	5	4	3	2	1	0
	OVF	WT/$\overline{IT}$	TME	—	—	CKS2	CKS1	CKS0
Initial value	0	0	0	1	1	0	0	0
Read/Write	R/(W)*	R/W	R/W	—	—	R/W	R/W	R/W

Timer enable

0	Timer disabled • TCNT is initialized to H'00 and halted
1	Timer enabled • TCNT is counting • CPU interrupt requests are enabled

Clock select 2 to 0

0	0	0	ϕ/2
		1	ϕ/32
	1	0	ϕ/64
		1	ϕ/128
1	0	0	ϕ/256
		1	ϕ/512
	1	0	ϕ/2048
		1	ϕ/4096

Timer mode select

0	Interval timer: requests interval timer interrupts
1	Watchdog timer: generates a reset signal

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] TCNT changes from H'FF to H'00

Note: * Only 0 can be written, to clear the flag.

TCNT—Timer Counter **H'A9 (read), H'A8 (write)** **WDT**

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Count value

RSTCSR—Reset Control/Status Register **H'AB (read), H'AA (write)** **WDT**

Bit	7	6	5	4	3	2	1	0
	WRST	—	—	—	—	—	—	—
Initial value	0	0	1	1	1	1	1	1
Read/Write	R/(W)*1	—*2	—	—	—	—	—	—

Watchdog timer reset

0	[Clearing conditions] • Reset signal input at $\overline{\text{RES}}$ pin • When WRST= “1”, write “0” after reading WRST flag
1	[Setting condition] TCNT overflow generates a reset signal

Notes: 1. Only 0 can be written in bit 7, to clear the flag.
2. Bit 6 must not be set to 1; in a write, 0 must always be written in this bit.

RFSHCR—Refresh Control Register **H'AC** **Refresh controller**

Bit	7	6	5	4	3	2	1	0
	SRFMD	PSRAME	DRAME	CAS/$\overline{WE}$	M9/$\overline{M8}$	RFSHE	—	RCYCE
Initial value	0	0	0	0	0	0	1	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

Refresh cycle enable

0	Refresh cycles are disabled
1	Refresh cycles are enabled for area 3

Refresh pin enable

0	Refresh signal output at the $\overline{RFSH}$ pin is disabled
1	Refresh signal output at the $\overline{RFSH}$ pin is enabled

Address multiplex mode select

0	8-bit column mode
1	9-bit column mode

Strobe mode select

0	2 $\overline{WE}$ mode
1	2 $\overline{CAS}$ mode

PSRAM enable, DRAM enable

Bit 6	Bit 5	
PSRAME	DRAME	RAM Interface
0	0	Can be used as an interval timer (DRAM and PSRAM cannot be directly connected)
	1	DRAM can be directly connected
1	0	PSRAM can be directly connected
	1	Illegal setting

Self-refresh mode

0	DRAM or PSRAM self-refresh is disabled in software standby mode
1	DRAM or PSRAM self-refresh is enabled in software standby mode

RTMCSR—Refresh Timer Control/Status Register H'AD Refresh controller

Bit	7	6	5	4	3	2	1	0
	CMF	CMIE	CKS2	CKS1	CKS0	—	—	—
Initial value	0	0	0	0	0	1	1	1
Read/Write	R/(W)*	R/W	R/W	R/W	R/W	—	—	—

Clock select 2 to 0

Bit 5	Bit 4	Bit 3	
CKS2	CKS1	CKS0	Counter Clock Source
0	0	0	Clock input is disabled
		1	φ/2
	1	0	φ/8
		1	φ/32
1	0	0	φ/128
		1	φ/512
	1	0	φ/2048
		1	φ/4096

Compare match interrupt enable

0	The CMI interrupt requested by CMF is disabled
1	The CMI interrupt requested by CMF is enabled

Compare match flag

0	[Clearing condition] Read CMF when CMF = 1, then write 0 in CMF
1	[Setting condition] RTCNT = RTCOR

Note: * Only 0 can be written, to clear the flag.

RTCNT—Refresh Timer Counter **H'AE** **Refresh controller**

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Count value

RTCOR—Refresh Time Constant Register **H'AF** **Refresh controller**

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Interval at which RTCNT and compare match are set

SMR—Serial Mode Register **H'B0** **SCI0**

Bit	7	6	5	7	3	2	1	0
	C/$\overline{A}$/GM	CHR	PE	O/$\overline{E}$	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock select 1 and 0

Bit 1	Bit 0	
CKS1	CKS0	Clock Source
0	0	ϕ clock
	1	ϕ/4 clock
1	0	ϕ/16 clock
	1	ϕ/64 clock

Multiprocessor mode

0	Multiprocessor function disabled
1	Multiprocessor format selected

Stop bit length

0	One stop bit
1	Two stop bits

Parity mode

0	Even parity
1	Odd parity

Parity enable

0	Parity bit is not added or checked
1	Parity bit is added and checked

Character length

0	8-bit data
1	7-bit data

Communication mode
(when using a serial communication interface)

0	Asynchronous mode
1	Synchronous mode

GSM mode (when using a smart card interface)

0	Regular smart card interface operation
1	GSM mode smart card interface operation

BRR—Bit Rate Register **H'B1** **SCI0**

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Serial communication bit rate setting

SCR—Serial Control Register **H'B2** **SCI0**

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock enable 1 and 0

Bit 1	Bit 0		
CKE1	CKE0	Clock Selection and Output	
0	0	Asynchronous mode	Internal clock, SCK pin available for generic I/O
		Synchronous mode	Internal clock, SCK pin used for serial clock output
	1	Asynchronous mode	Internal clock, SCK pin used for clock output
		Synchronous mode	Internal clock, SCK pin used for serial clock output
1	0	Asynchronous mode	External clock, SCK pin used for clock input
		Synchronous mode	External clock, SCK pin used for serial clock input
	1	Asynchronous mode	External clock, SCK pin used for clock input
		Synchronous mode	External clock, SCK pin used for serial clock input

Transmit-end interrupt enable

0	Transmit-end interrupt requests (TEI) are disabled
1	Transmit-end interrupt requests (TEI) are enabled

Multiprocessor interrupt enable

0	Multiprocessor interrupts are disabled (normal receive operation)
1	Multiprocessor interrupts are enabled

Receive enable

0	Receiving is disabled
1	Receiving is enabled

Transmit enable

0	Transmitting is disabled
1	Transmitting is enabled

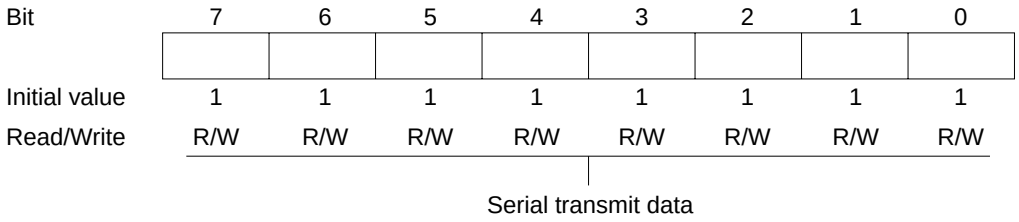
Receive interrupt enable

0	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are disabled
1	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are enabled

Transmit interrupt enable

0	Transmit-data-empty interrupt request (TXI) is disabled
1	Transmit-data-empty interrupt request (TXI) is enabled

TDR—Transmit Data Register **H'B3** **SCI0**



SSR—Serial Status Register H'B4 SCI0

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER/ERS	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Multiprocessor bit

0	Multiprocessor bit value in receive data is 0
1	Multiprocessor bit value in receive data is 1

Multiprocessor bit transfer

0	Multiprocessor bit value in transmit data is 0
1	Multiprocessor bit value in transmit data is 1

Parity error

0	[Clearing conditions] • Reset or transition to standby mode. • Read PER when PER = 1, then write 0 in PER.
1	[Setting condition] Parity error: (parity of receive data does not match parity setting O/$\overline{E}$ bit in SMR)

Transmit end

0	[Clearing conditions] • Read TDRE when TDRE = 1, then write 0 in TDRE. • The DMAC writes data in TDR.
1	[Setting conditions] • Reset or transition to standby mode. • TE is cleared to 0 in SCR and FER/ERS is cleared to 0. • TDRE is 1 when last bit of 1-byte serial character is transmitted.

Framing error (for SCI0)

0	[Clearing conditions] • Reset or transition to standby mode. • Read FER when FER = 1, then write 0 in FER.
1	[Setting condition] Framing error (stop bit is 0)

Error signal status (for smart card interface)

0	[Clearing conditions] • Reset or transition to standby mode. • Read ERS when ERS = 1, then write 0 in ERS.
1	[Setting condition] A low error signal is received.

Overrun error

0	[Clearing conditions] • Reset or transition to standby mode. • Read ORER when ORER = 1, then write 0 in ORER.
1	[Setting condition] Overrun error (reception of next serial data ends when RDRF = 1)

Receive data register full

0	[Clearing conditions] • Reset or transition to standby mode. • Read RDRF when RDRF = 1, then write 0 in RDRF. • The DMAC reads data from RDR.
1	[Setting condition] Serial data is received normally and transferred from RSR to RDR

Transmit data register empty

0	[Clearing conditions] • Read TDRE when TDRE = 1, then write 0 in TDRE. • The DMAC writes data in TDR.
1	[Setting conditions] • Reset or transition to standby mode. • TE is 0 in SCR • Data is transferred from TDR to TSR, enabling new data to be written in TDR.

Note: * Only 0 can be written, to clear the flag.

RDR—Receive Data Register **H'B5** **SCI0**

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

Serial receive data

SCMR—Smart Card Mode Register **H'B6** **SCI0**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SDIR	SINV	—	SMIF
Initial value	1	1	1	1	0	0	1	0
Read/Write	—	—	—	—	R/W	R/W	—	R/W

Smart card interface mode select

0	Smart card interface function is disabled (Initial value)
1	Smart card interface function is enabled

Smart card data invert

0	Unmodified TDR contents are transmitted (Initial value) Received data is stored unmodified in RDR
1	Inverted TDR contents are transmitted Received data are inverted before storage in RDR

Smart card data transfer direction

0	TDR contents are transmitted LSB-first (Initial value) Received data is stored LSB-first in RDR
1	TDR contents are transmitted MSB-first Received data is stored MSB-first in RDR

SMR—Serial Mode Register **H'B8** **SCI1**

Bit	7	6	5	4	3	2	1	0
	C/$\overline{A}$	CHR	PE	O/$\overline{E}$	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for SCI0.

BRR—Bit Rate Register **H'B9** **SCI1**

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for SCI0.

SCR—Serial Control Register **H'BA** **SCI1**

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for SCI0.

TDR—Transmit Data Register **H'BB** **SCI1**

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for SCI0.

SSR—Serial Status Register **H'BC** **SCI1**

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Notes: Bit functions are the same as for SCI0.
* Only 0 can be written, to clear the flag.

RDR—Receive Data Register **H'BD** **SCI1**

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

Note: Bit functions are the same as for SCI0.

P1DDR—Port 1 Data Direction Register **H'C0** **Port 1**

Bit		7	6	5	4	3	2	1	0

Data for port A pins

PBDDR—Port B Data Direction Register **H'D4** **Port B**

Bit	7	6	5	4	3	2	1	0
	PB_7DDR	PB_6DDR	PB_5DDR	PB_4DDR	PB_3DDR	PB_2DDR	PB_1DDR	PB_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B input/output select

0	Generic input pin
1	Generic output pin

PBDR—Port B Data Register **H'D6** **Port B**

Bit	7	6	5	4	3	2	1	0
	PB_7	PB_6	PB_5	PB_4	PB_3	PB_2	PB_1	PB_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Data for port B pins

P2PCR—Port 2 Input Pull-Up MOS Control Register H'D8 Port 2

Bit	7	6	5	4	3	2	1	0
	$P2_7PCR$	$P2_6PCR$	$P2_5PCR$	$P2_4PCR$	$P2_3PCR$	$P2_2PCR$	$P2_1PCR$	$P2_0PCR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 input pull-up MOS control 7 to 0

0	Input pull-up transistor is off
1	Input pull-up transistor is on

Note: Valid when the corresponding P2DDR bit is cleared to 0 (designating generic input).

P4PCR—Port 4 Input Pull-Up MOS Control Register H'DA Port 4

Bit	7	6	5	4	3	2	1	0
	$P4_7PCR$	$P4_6PCR$	$P4_5PCR$	$P4_4PCR$	$P4_3PCR$	$P4_2PCR$	$P4_1PCR$	$P4_0PCR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 4 input pull-up MOS control 7 to 0

0	Input pull-up transistor is off
1	Input pull-up transistor is on

Note: Valid when the corresponding P4DDR bit is cleared to 0 (designating generic input).

P5PCR—Port 5 Input Pull-Up MOS Control Register H'DB Port 5

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3PCR$	$P5_2PCR$	$P5_1PCR$	$P5_0PCR$
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Port 5 input pull-up MOS control 3 to 0

0	Input pull-up transistor is off
1	Input pull-up transistor is on

Note: Valid when the corresponding P5DDR bit is cleared to 0 (designating generic input).

DADR0—D/A Data Register 0 H'DC D/A

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D/A conversion data

DADR1—D/A Data Register 1 H'DD D/A

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D/A conversion data

DACR—D/A Control Register **H'DE** **D/A**

Bit	7	6	5	4	3	2	1	0
	DAOE1	DAOE0	DAE	—	—	—	—	—
Initial value	0	0	0	1	1	1	1	1
Read/Write	R/W	R/W	R/W	—	—	—	—	—

D/A enable

Bit 7	Bit 6	Bit 5	
DAOE1	DAOE0	DAE	Description
0	0	—	D/A conversion is disabled in channels 0 and 1
	1	0	D/A conversion is enabled in channel 0 D/A conversion is disabled in channel 1
		1	D/A conversion is enabled in channels 0 and 1
1	0	0	D/A conversion is disabled in channel 0 D/A conversion is enabled in channel 1
		1	D/A conversion is enabled in channels 0 and 1
	1	—	D/A conversion is enabled in channels 0 and 1

D/A output enable 0

0	DA_0 analog output is disabled
1	Channel-0 D/A conversion and DA_0 analog output are enabled

D/A output enable 1

0	DA_1 analog output is disabled
1	Channel-1 D/A conversion and DA_1 analog output are enabled

ADDRA H/L—A/D Data Register A H/L **H'E0, H'E1** **A/D**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

ADDRAH ADDRAL

A/D conversion data
10-bit data giving an A/D conversion result

ADDRB H/L—A/D Data Register B H/L **H'E2, H'E3** **A/D**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
	ADDRBH								ADDRBL							

A/D conversion data
10-bit data giving an
A/D conversion result

ADDRC H/L—A/D Data Register C H/L **H'E4, H'E5** **A/D**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
	ADDRCH								ADDRCL							

A/D conversion data
10-bit data giving an
A/D conversion result

ADDRD H/L—A/D Data Register D H/L **H'E6, H'E7** **A/D**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
	ADDRDH								ADDRDL							

A/D conversion data
10-bit data giving an
A/D conversion result

ADCSR—A/D Control/Status Register **H'E8** **A/D**

Bit	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	SCAN	CKS	CH2	CH1	CH0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock select

0	Conversion time = 266 states (maximum)
1	Conversion time = 134 states (maximum)

Channel select 2 to 0

Group Selection	Channel Selection		Description	
CH2	CH1	CH0	Single Mode	Scan Mode
0	0	0	AN_0	AN_0
		1	AN_1	AN_0, AN_1
	1	0	AN_2	AN_0 to AN_2
		1	AN_3	AN_0 to AN_3
1	0	0	AN_4	AN_4
		1	AN_5	AN_4, AN_5
	1	0	AN_6	AN_4 to AN_6
		1	AN_7	AN_4 to AN_7

Scan mode

0	Single mode
1	Scan mode

A/D start

0	A/D conversion is stopped
1	Single mode: A/D conversion starts; ADST is automatically cleared to 0 when conversion ends Scan mode: A/D conversion starts and continues, cycling among the selected channels, until ADST is cleared to 0 by software, by a reset, or by a transition to standby mode

A/D interrupt enable

0	A/D end interrupt request is disabled
1	A/D end interrupt request is enabled

A/D end flag

0	[Clearing condition] Read ADF while ADF = 1, then write 0 in ADF
1	[Setting conditions] • Single mode: A/D conversion ends • Scan mode: A/D conversion ends in all selected channels

Note: * Only 0 can be written, to clear flag.

ADCR—A/D Control Register H'E9 A/D

Bit	7	6	5	4	3	2	1	0
	TRGE	—	—	—	—	—	—	—
Initial value	0	1	1	1	1	1	1	0
Read/Write	R/W	—	—	—	—	—	—	—*

Trigger enable

0	A/D conversion cannot be externally triggered
1	A/D conversion starts at the fall of the external trigger signal ($\overline{\text{ADTRG}}$)

Note: * Bit 0 must not be set to 1; in a write, 0 must always be written in this bit.

ABWCR—Bus Width Control Register H'EC Bus controller

Bit	7	6	5	4	3	2	1	0
	ABW7	ABW6	ABW5	ABW4	ABW3	ABW2	ABW1	ABW0
Initial value, Mode 1,3,5,6	1	1	1	1	1	1	1	1
Initial value, Mode 2,4,7	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 7 to 0 bus width control

Bits 7 to 0	
ABW7 to ABW0	Bus Width of Access Area
0	Areas 7 to 0 are 16-bit access areas
1	Areas 7 to 0 are 8-bit access areas

ASTCR—Access State Control Register H'ED Bus controller

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 7 to 0 access state control

Bits 7 to 0	
AST7 to AST0	Number of States in Access Cycle
0	Areas 7 to 0 are two-state access areas
1	Areas 7 to 0 are three-state access areas

WCR—Wait Control Register H'EE Bus controller

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	WMS1	WMS0	WC1	WC0
Initial value	1	1	1	1	0	0	1	1
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Wait mode select 1 and 0

Bit 3	Bit 2	
WMS1	WMS0	Wait Mode
0	0	Programmable wait mode
	1	No wait states inserted by wait-state controller
1	0	Pin wait mode 1
	1	Pin auto-wait mode

Wait count 1 and 0

Bit 1	Bit 0	
WC1	WC0	Number of Wait States
0	0	No wait states inserted by wait-state controller
	1	1 state inserted
1	0	2 states inserted
	1	3 states inserted

WCER—Wait-State Controller Enable Register H'EF Bus controller

Bit	7	6	5	4	3	2	1	0
	WCE7	WCE6	WCE5	WCE4	WCE3	WCE2	WCE1	WCE0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Wait-state controller enable 7 to 0

0	Wait-state control is disabled (pin wait mode 0)
1	Wait-state control is enabled

MDCR—Mode Control Register **H'F1** **System control**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	MDS2	MDS1	MDS0
Initial value	1	1	0	0	0	—*	—*	—*
Read/Write	—	—	—	—	—	R	R	R

Mode select 2 to 0

Bit 2	Bit 1	Bit 0	
MD_2	MD_1	MD_0	Operating mode
0	0	0	—
		1	Mode 1
	1	0	Mode 2
		1	Mode 3
1	0	0	Mode 4
		1	Mode 5
	1	0	Mode 6
		1	Mode 7

Note: * Determined by the state of the mode pins (MD_2 to MD_0).

SYSCR—System Control Register **H'F2** **System control**

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

RAM enable

0	On-chip RAM is disabled
1	On-chip RAM is enabled

NMI edge select

0	An interrupt is requested at the falling edge of NMI
1	An interrupt is requested at the rising edge of NMI

User bit enable

0	CCR bit 6 (UI) is used as an interrupt mask bit
1	CCR bit 6 (UI) is used as a user bit

Standby timer select 2 to 0

Bit 6	Bit 5	Bit 4	
STS2	STS1	STS0	Standby Timer
0	0	0	Waiting time = 8,192 states
		1	Waiting time = 16,384 states
	1	0	Waiting time = 32,768 states
		1	Waiting time = 65,536 states
1	0	0	Waiting time = 131,072 states
		1	Waiting time = 1,024 states
	1	—	Illegal setting

Software standby

0	SLEEP instruction causes transition to sleep mode
1	SLEEP instruction causes transition to software standby mode

BRCR—Bus Release Control Register **H'F3** **Bus controller**

Bit		7	6	5	4	3	2	1	0
		A23E	A22E	A21E	—	—	—	—	BRLE
Modes 1, 2, 5, 7	Initial value	1	1	1	1	1	1	1	0
	Read/Write	—	—	—	—	—	—	—	R/W
Modes 3, 4, 6	Initial value	1	1	1	1	1	1	1	0
	Read/Write	R/W	R/W	R/W	—	—	—	—	R/W

Bus release enable

0	The bus cannot be released to an external device
1	The bus can be released to an external device

Address 23 to 21 enable

0	Address output
1	Other input/output

ISCR—IRQ Sense Control Register **H'F4** **Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5SC	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IRQ_5 to IRQ_0 sense control

0	Interrupts are requested when $\overline{IRQ_5}$ to $\overline{IRQ_0}$ inputs are low
1	Interrupts are requested by falling-edge input at $\overline{IRQ_5}$ to $\overline{IRQ_0}$

IER—IRQ Enable Register **H'F5 Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5E	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)

IRQ_5 to IRQ_0 enable

0	IRQ_5 to IRQ_0 interrupts are disabled
1	IRQ_5 to IRQ_0 interrupts are enabled

ISR—IRQ Status Register **H'F6 Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	—	—	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value	0	0	0	0	0	0	0	0
Read/Write	—	—	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

IRQ_5 to IRQ_0 flags

Bits 5 to 0 IRQ5F to IRQ0F	Setting and Clearing Conditions
0	[Clearing conditions] • Read IRQnF when IRQnF = 1, then write 0 in IRQnF. • IRQnSC = 0, $\overline{IRQn}$ input is high, and interrupt exception handling is carried out. • IRQnSC = 1 and IRQn interrupt exception handling is carried out.
1	[Setting conditions] • IRQnSC = 0 and $\overline{IRQn}$ input is low. • IRQnSC = 1 and a falling edge is generated in the $\overline{IRQn}$ input.

(n = 5 to 0)

Note: * Only 0 can be written, to clear the flag.

IPRA—Interrupt Priority Register A **H'F8 Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	IPRA7	IPRA6	IPRA5	IPRA4	IPRA3	IPRA2	IPRA1	IPRA0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level A7 to A0

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

- Interrupt sources controlled by each bit

	Bit 7: IPRA7	Bit 6: IPRA6	Bit 5: IPRA5	Bit 4: IPRA4	Bit 3: IPRA3	Bit 2: IPRA2	Bit 1: IPRA1	Bit 0: IPRA0
Interrupt source	IRQ_0	IRQ_1	IRQ_2, IRQ_3	IRQ_4, IRQ_5	WDT, Refresh Controller	ITU channel 0	ITU channel 1	ITU channel 2

IPRB—Interrupt Priority Register B **H'F9 Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	IPRB7	IPRB6	IPRB5	—	IPRB3	IPRB2	IPRB1	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level B7 to B5, B3 to B 1

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

- Interrupt sources controlled by each bit

	Bit 7: IPRB7	Bit 6: IPRB6	Bit 5: IPRB5	Bit 4: —	Bit 3: IPRB3	Bit 2: IPRB2	Bit 1: IPRB1	Bit 0: —
Interrupt source	ITU channel 3	ITU channel 4	DMAC	—	SCI channel 0	SCI channel 1	A/D converter	—

Appendix D Pin States

D.1 Port States in Each Mode

Table D.1 Port States

Pin Name	Mode		Reset	Hardware Standby Mode	Software Standby Mode	Bus-Released Mode	Program Execution, Sleep Mode
ϕ	—		Clock output	T	H	Clock output	Clock output
$P1_7$ to $P1_0$	1 to 4		L	T	T	T	A_7 to A_0
	5, 6		T	T	keep	T	Input port (DDR = 0)
					T	T	A_7 to A_0 (DDR = 1)
	7		T	T	keep	—	I/O port
$P2_7$ to $P2_0$	1 to 4		L	T	T	T	A_{15} to A_8
	5, 6		T	T	keep	T	Input port (DDR = 0)
					T	T	A_{15} to A_8 (DDR = 1)
	7		T	T	keep	—	I/O port
$P3_7$ to $P3_0$	1 to 6		T	T	T	T	D_{15} to D_8
	7		T	T	keep	—	I/O port
$P4_7$ to $P4_0$	1 to 6	8-bit bus	T	T	keep	keep	I/O port
		16-bit bus	T	T	T	T	D_7 to D_0
	7		T	T	keep	—	I/O port
$P5_3$ to $P5_0$	1 to 4		L	T	T	T	A_{19} to A_{16}
	5, 6		T	T	keep	T	Input port (DDR = 0)
					T	T	A_{19} to A_{16} (DDR = 1)
	7		T	T	keep	—	I/O port

Pin Name	Mode	Reset	Hardware Standby Mode	Software Standby Mode	Bus-Released Mode	Program Execution, Sleep Mode
$P6_0$	1 to 6	T	T	keep	keep	I/O port $\overline{WAIT}$
	7	T	T	keep	—	I/O port
$P6_1$	1 to 6	T	T	keep (BRLE = 0) T (BRLE = 1)	T	I/O port $\overline{BREQ}$
	7	T	T	keep	—	I/O port
$P6_2$	1 to 6	T	T	keep (BRLE = 0) H (BRLE = 1)	L	I/O port (BRLE = 0) or $\overline{BACK}$ (BRLE = 1)
	7	T	T	keep	—	I/O port
$P6_6$ to $P6_3$	1 to 6	H*2	T	T	T	$\overline{AS}$, $\overline{RD}$, $\overline{HWR}$, $\overline{LWR}$
	7	T	T	keep	—	I/O port
$P7_7$ to $P7_0$	1 to 7	T	T	T	T*1	Input port
$P8_0$	1 to 6	T	T	keep (RFSHE = 0) $\overline{RFSH}$ (RFSHE = 1)	keep (RFSHE = 0) H (RFSHE = 1)	I/O port (RFSHE = 0) or $\overline{RFSH}$ (RFSHE = 1)
	7	T	T	keep	—	I/O port
$P8_3$ to $P8_1$	1 to 6	T	T	T (DDR = 0) H (DDR = 1)	keep (DDR = 0) H (DDR = 1)	Input port (DDR = 0) or $\overline{CS}_3$ to $\overline{CS}_1$ (DDR = 1)
	7	T	T	keep	—	I/O port
$P8_4$	1 to 6	L	T	T (DDR = 0) L (DDR = 1)	keep (DDR = 0) H (DDR = 1)	Input port (DDR = 0) or $\overline{CS}_0$ (DDR = 1)
	7	T	T	keep	—	I/O port
$P9_6$ to $P9_0$	1 to 7	T	T	keep	keep*1	I/O port

Pin Name	Mode	Reset	Hardware Standby Mode	Software Standby Mode	Bus-Released Mode	Program Execution, Sleep Mode
PA_3 to PA_0	1 to 7	T	T	keep	keep*1	I/O port
PA_6 to PA_4	3, 4, 6	T*3	T	H (CS output)	H (CS output)	$\overline{CS}_6$ to $\overline{CS}_4$ (CS output)
				T (address output)	T (address output)	A23 to A21 (address output)
				keep (otherwise)	keep (otherwise)	I/O port (otherwise)
	1, 2, 5, 7	T*3	T	keep	keep*1	I/O port
PA_7	3, 4, 6	L*3	T	T	T	A_{20}
	1, 2, 5, 7	T*3	T	keep	keep*1	I/O port
PB_7, PB_5 to PB_0	1 to 7	T	T	keep	keep*1	I/O port
PB_6	3, 4, 6	T	T	H (CS output)	H (CS output)	$\overline{CS}_7$ (CS output)
				keep (otherwise)	keep (otherwise)	I/O port (otherwise)
	1, 2, 5, 7	T	T	keep	keep*1	I/O port

Legend:

H: High

L: Low

T: High-impedance state

keep: Input pins are in the high-impedance state; output pins maintain their previous state.

DDR: Data direction register bit

Notes: 1. The bus cannot be released in mode 7.

2. During direct power supply, oscillation damping time is “H” or “T”.

3. During direct power supply, oscillation damping time differs between “H”, “L” and “T”.

D.2 Pin States at Reset

Reset in T_1 State: Figure D.1 is a timing diagram for the case in which $\overline{RES}$ goes low during the T_1 state of an external memory access cycle. As soon as $\overline{RES}$ goes low, all ports are initialized to the input state. $\overline{AS}$, $\overline{RD}$, $\overline{HWR}$, and $\overline{LWR}$ go high, and the data bus goes to the high-impedance state. The address bus is initialized to the low output level 0.5 state after the low level of $\overline{RES}$ is sampled. Sampling of $\overline{RES}$ takes place at the fall of the system clock (ϕ).

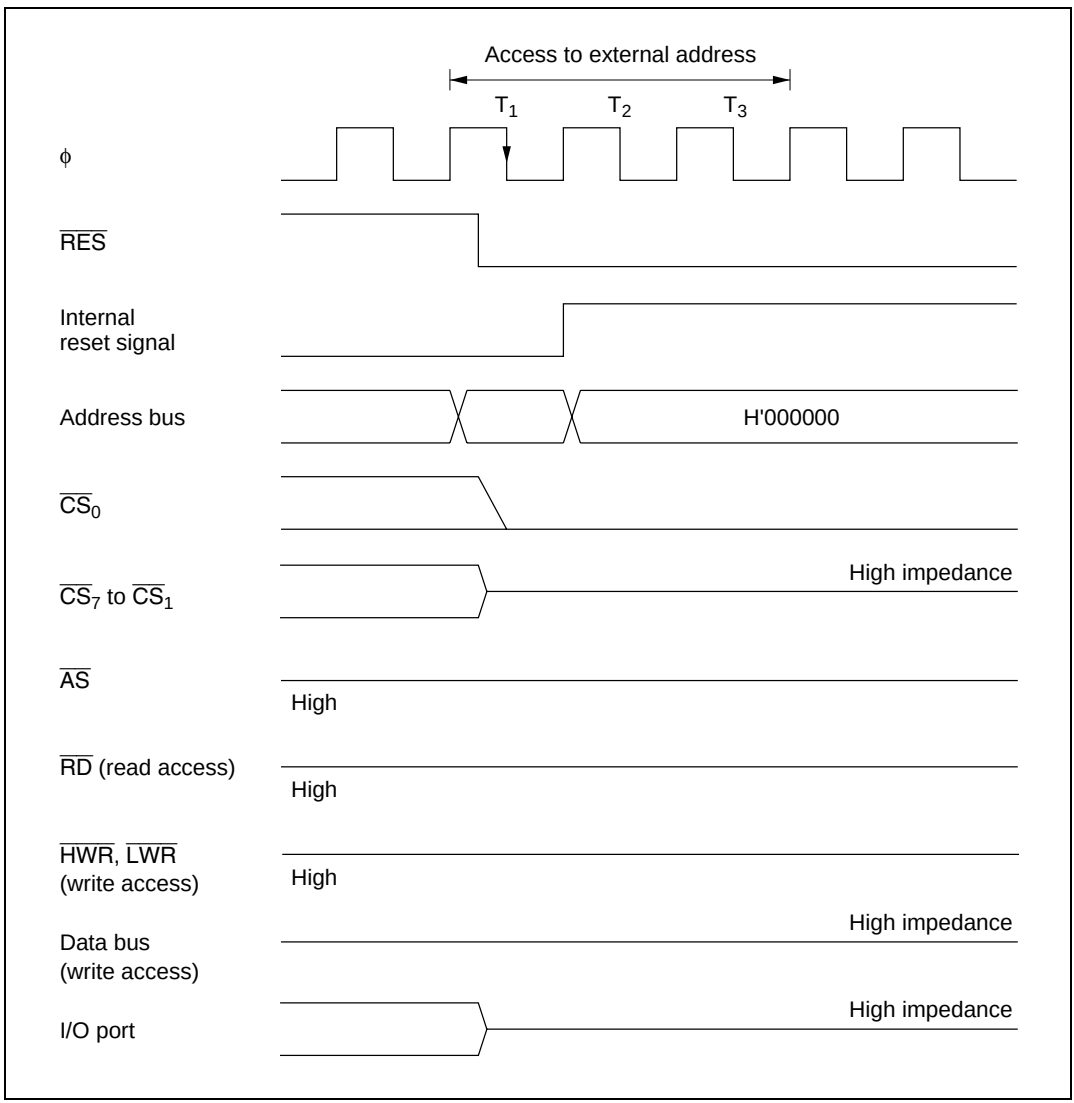

Figure D.1 Reset during Memory Access (Reset during T_1 State)

Reset in T_2 State: Figure D.2 is a timing diagram for the case in which $\overline{RES}$ goes low during the T_2 state of an external memory access cycle. As soon as $\overline{RES}$ goes low, all ports are initialized to the input state. $\overline{AS}$, $\overline{RD}$, $\overline{HWR}$, and $\overline{LWR}$ go high, and the data bus goes to the high-impedance state. The address bus is initialized to the low output level 0.5 state after the low level of $\overline{RES}$ is sampled. The same timing applies when a reset occurs during a wait state (T_W).

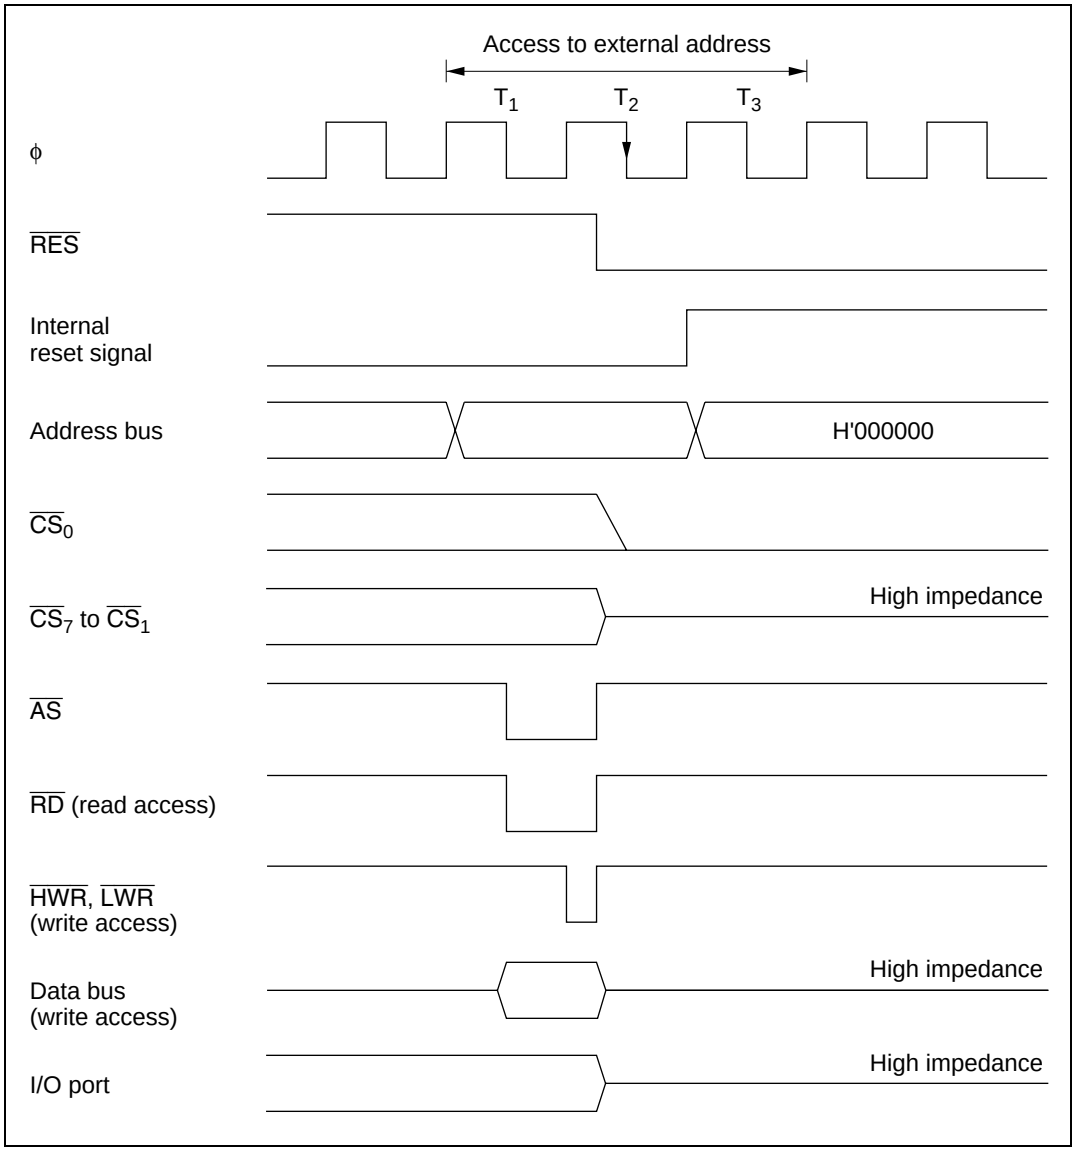

Figure D.2 Reset during Memory Access (Reset during T_2 State)

Reset in T_3 State: Figure D.3 is a timing diagram for the case in which $\overline{RES}$ goes low during the T_3 state of an external three-state space access cycle. As soon as $\overline{RES}$ goes low, all ports are initialized to the input state. $\overline{AS}$, $\overline{RD}$, $\overline{HWR}$, and $\overline{LWR}$ go high, and the data bus goes to the high-impedance state. The address bus outputs are held during the T_3 state. The same timing applies when a reset occurs in the T_2 state of an access cycle to a two-state-access area.

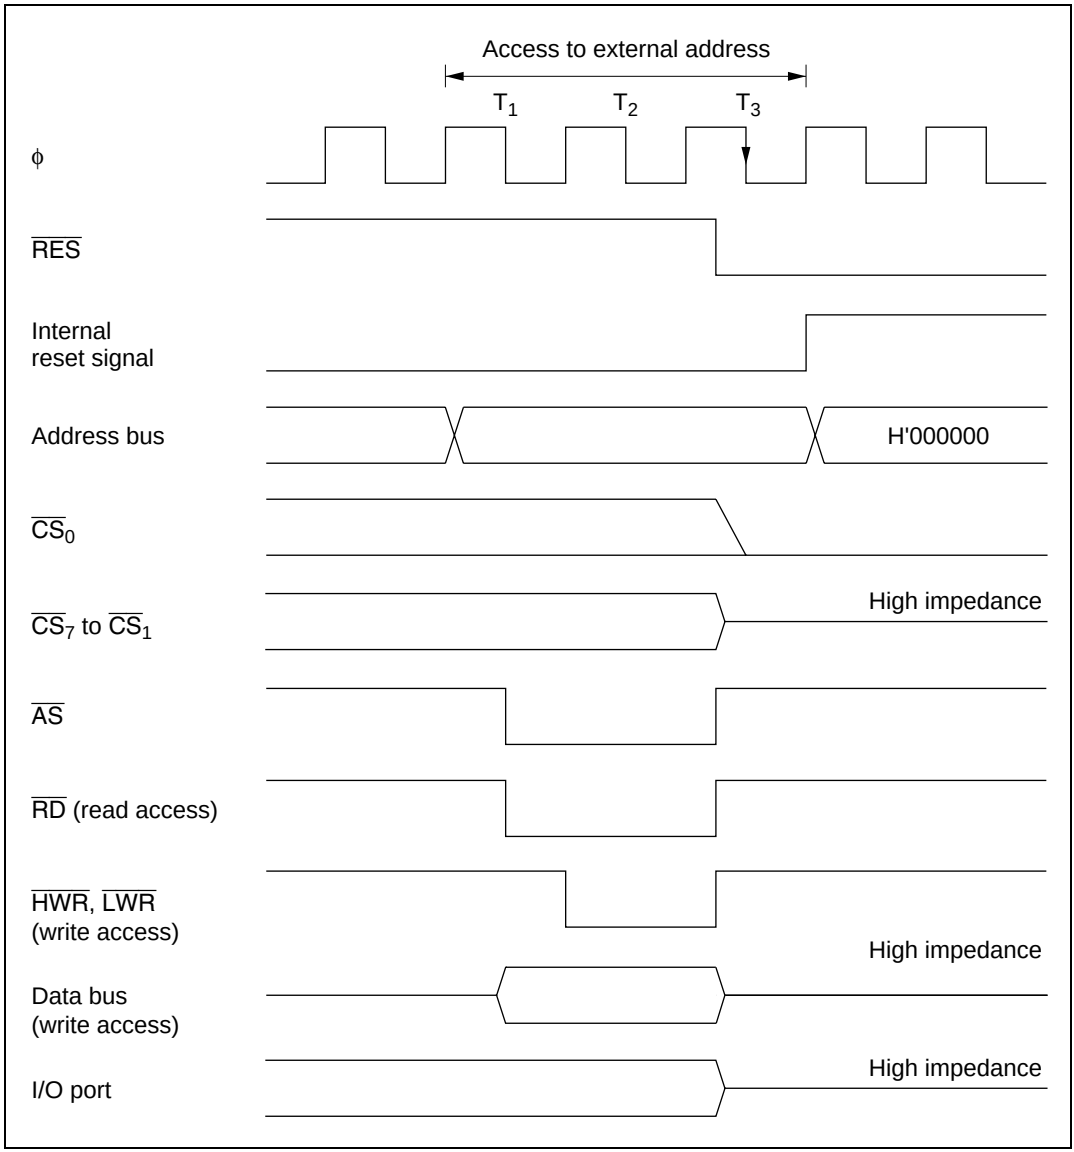

Figure D.3 Reset during Memory Access (Reset during T_3 State)

Appendix E Timing of Transition to and Recovery from Hardware Standby Mode

E.1 Timing of Transition to Hardware Standby Mode

(1) To retain RAM contents with the RAME bit set to 1 in SYSCR, drive the $\overline{\text{RES}}$ signal low 10 system clock cycles before the $\overline{\text{STBY}}$ signal goes low, as shown below. The minimum delay from the fall of the $\overline{\text{STBY}}$ signal to the rise of the $\overline{\text{RES}}$ signal is 0 ns.

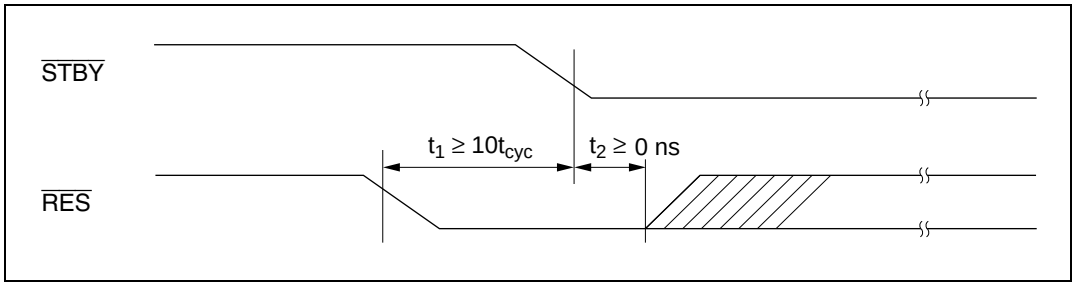

Figure E.1 Timing of Recovery from Hardware Standby Mode (1)

(2) To retain RAM contents with the RAME bit cleared to 0 in SYSCR, or when RAM contents do not need to be retained, $\overline{\text{RES}}$ does not have to be driven low as in (1).

E.2 Timing of Recovery from Hardware Standby Mode

Drive the $\overline{\text{RES}}$ signal low approximately 100 ns before $\overline{\text{STBY}}$ goes high.

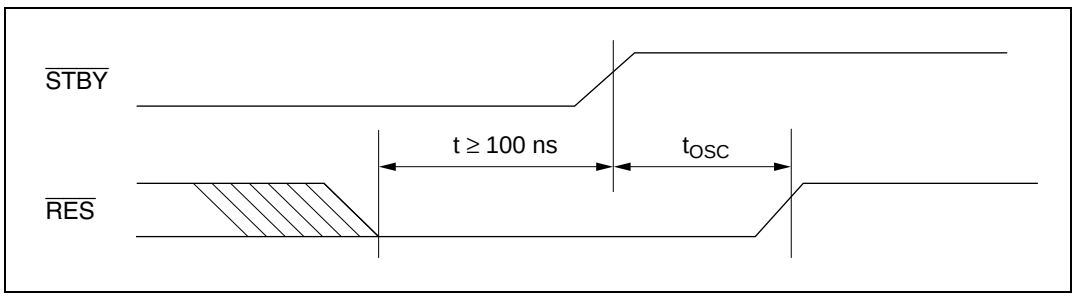

Figure E.2 Timing of Recovery from Hardware Standby Mode (2)

Appendix F Product Code Lineup

Table F.1 H8/3052B F-ZTAT Product Code Lineup

Product Type	Product Code	Mark Code	Package (Package Code)
H8/3052 F-ZTAT 5 V version B mask version	HD64F3052BTE	HD64F3052BTE	100-pin TQFP (TFP-100B)
